With regard to these two first objections, we would ask any person at all acquainted with the trade of Russia, whether it is possible for Russia to find a market, in any part of the world, for the tallow she supplies to us:—we assert that she cannot:—we also assert, that from the nature of her system of agriculture, the Russian farmer must continue to feed cattle and to make tallow;—that, if the duty we lay on here, should force down the prices in Russia, all that will happen, will be, that instead of there being five or six profits made out of the tallow, for as many different dealers, brokers, melters, and merchants, &c. through whose hands it passes before we get it, the first producer will find means to sell it more directly (as it is sold in every other country from whence we get any) to our own merchants, and thus those various profits and various local imposts and export duties (which the Russian government authorize and demand) will be saved to our community, and instead of falling into Russian hands, will fall into our own revenue.

But even supposing that the Russians cannot supply us with tallow at the same rates, we deny that tallow is an ingredient which, of necessity, we must have for the manufacture of soap. Cocoa-nut, palm and olive-oil are all better and all cheaper substances, except the latter, which is incontrovertibly the best of all, which we are prepared to shew may be got at rates 30 per cent. under the present prices, if it should become an article in which British capitalists, with their enterprise, would find (from increased consumption) enough of scope for the employment of capital. If we want any proof of these assertions, we find it in the following facts, which the statistical returns will prove:—A very few years ago neither palm nor cocoa-nut oil were used in this country; whereas now the annual consumption of the former is upwards of 13,000 tons, and of the latter 400 tons, and is increasing every year. As to olive-oil certainly none is used here for either the purposes of making soap or for lighting, because, like

those other articles, our manufactures have not yet found it cheap enough, and the reason for that is, that the high duty (lately, though not sufficiently lowered)\* discouraged mercantile speculators from seeking for extensive fields of supply at cheap rates, which fields are to be found in many parts of Europe, Asia, and Africa, but principally in the Turkish provinces, if once there were inducements held out to import the article largely. We need give no better proof of the correctness of this assertion than by mentioning the following facts:—Great Britain imports of olive-oil only about 8,000 tons annually (two years ago only 6,000 tons), at prices varying from 50*l.* to 60*l.* per ton, while the French import annually from 30,000 to 35,000 tons, at prices fully 15 to 20 per cent. lower. Out of this quantity, they apply more than 20,000 tons to the manufacture of soap, which soap, being infinitely better than British soap made from tallow, they export to Turkey, Egypt, Greece, and many other countries, both in the north and south of Europe, to which we do not export any soap at all, and have, besides a preference given to, and a greater demand for, their soap in the markets of South and North America. If any one reason beyond another exists for the earnest desire of France has shewn to secure to herself so much of the Mediterranean coast of Africa, it is because she finds there such valuable sources of supply of olive-oil, which, in its raw and manufactured state, she supplies to other nations.

It is impossible to place a limit to the immense supplies which we may find of olive, palm, and cocoa-nut oils, which at this moment would be used for the great majority of the purposes to which Russian tallow is applied, were it not for legislative enactments. The former would be found in the Asiatic, European, and African provinces of Turkey, the Morea and Greek Islands, Spain, and Portugal, where now a large proportion of the olives rot on the ground. The two latter articles, for making oil from, are to be found in endless quantities in Western Africa and India—all these countries take our manufactures readily, and *want* but opportunities to take these to a greater extent, and to give us their products in return, while the country which supplies us with tallow takes from us little else than yarn she needs, to supply her manufactures, to exclude our stuffs not only from her own empire, but from the Asiatic market, and that little only until she can supply herself with yarn of her own manufacture. But we have been led away from the consideration that our own home supply of tallow would by any increase of duty on foreign be augmented very largely; *because it would then answer the farmer's purpose to keep a greater proportion of live stock.* In fact, within these few years past, improvements in agriculture have greatly increased the home supply of tallow, so much so as to cause a decrease in the consumption of foreign tallow throughout the kingdom. But for this extraordinary home production, during the last year, the price of tallow must have risen to an alarming height.

We have now to answer the third and last objection. It is true that any increase of duty on a

\* The reduction is, however, only nominal, the duty on Gallipoli oil having been retained, and no arrangement having been made with Turkey for the exportation of oil from that country, though the tariff shows a reduction of duty per ton of 4*l.* 4*s.*, yet, in fact, that reduction is inoperative.—See Portfolio, No. XI.

raw article is contrary to the doctrine of free-trade. Of that principle we are the decided advocates, we do not question it, but we state the grounds upon which we conceive this measure is advisable; happy would it be for this country if neither laws, nor regulations, nor duties, interfered with the exchange of man's industry and nature's bounty, but involved as we are in the toils of commercial legislation, must we bear the burden they inflict without taking advantage of the chances they offer?

It is argued that we ought to keep all our import duties as low as possible in order to induce other nations to lower theirs in favour of our manufactures. Well, we have kept our duty on tallow low ever since the last war; and what has been the result? Have our exports increased to Russia, from whence we draw our almost sole supply? The very reverse is the case upon the aggregate, for they have been annually decreasing, except on cotton twist, and some dye stuffs on which we have the least profit, for whereas in 1827 Russia took from us cotton and woollen *manufactures* to the value of upwards of 300,000*l.*; she in 1834 took of the same goods in value only 175,000*l.* Even cotton twist, the increase is very trivial, for in 1827 the export value was 930,000*l.* and in 1834 1,030,000*l.* This article she takes for her own manufactures, which she sends to compete with ours in her Southern Provinces, in Persia and Eastern Turkey. During all these years, and ever since the last war, our importation of tallow has been increasing, and for thirteen years past, the price has also increased; thus in 1820 (from which year only we have returns) the importation was 40,000 tons, in 1834 it was 65,000 tons. In 1822 the price averaged 35*l.* per ton; in 1835 it averaged 43*l.* per ton, thus showing the necessity of seeking for the supply of oleaginous substitutes from some other countries. It is remarkable fact, that while nearly thirty articles which form large items of consumption in this country have all fallen in value during the last ten years, at a ratio varying from 40 to 50 per cent., tallow has increased in price fully 12 per cent., notwithstanding all the decrease of consumption from the introduction of gas, by which also oil has been rendered so much cheaper. Be it known too that the Russian government assists the Russian merchants in holding back their supplies of tallow in order to keep up the price in this country.

It has been argued in favour of low import duties, that although any country trading with us may not take our manufactures in return for her produce, still as she may apply herself with them elsewhere at a much greater cost, she is annually a loser of the difference between that greater cost and what she would pay us, and that thus in time she will see her error and turn to us at last. We ask, whether this is a sound doctrine in reference to countries that are hending all their energies to become manufacturers themselves, and that have facilities to become so by having labour and fuel cheap.

In Russia and Prussia, where this is the case, it is not the demand of the public which can induce the government to alter their tariff in our favour; for these governments are themselves the proprietors of all the new manufactures which they are supporting with all their power, and are supplying with every species of information and new invention, got from this country, by having agents regularly established in all our manufacturing districts, whose whole business is to obtain

sketches, models, and details of every new process or improvement.

In a former article we have endeavoured to show that, by raising the duty on Russian produce, you reproduce the circumstances that preceded the death of the Emperor Paul, and that forced Alexander to abandon the continental system of Napoleon—that is, that you raised such an opposition of the nobles to the government, that a continuance of the policy which had interfered with exportation to England became impossible; so now, by such a measure, Russia would be brought to a state of absolute dependence on England, and must of necessity abandon her aggressive projects. England, it is true, possesses ample means of coercing Russia, but the difficulty is to get such a government as ours to do any thing at all. Now, here is a case where various internal and powerful interests are deeply involved, and where, for once, the views of the agriculturists coincide with measures conducive to our external security.

**LORD ASHBURTON AND THE CENTRAL AGRICULTURAL SOCIETY.**—The following extract from the *Chelmsford Chronicle*, refers to observations made with the authority of the Central Society, on his lordship's speech upon the appointment of the Lord's Committee upon Agriculture:—

"Now we do not intend to argue on the correctness of Lord Ashburton's opinions in this respect—on political questions, it is well known, we often dissent from him—but we think it an act of justice to observe, that though he is "no longer dependent on the honest votes of the Essex farmers," he is not so dead to their interests or so intent on guarding his "breeches pocket," as the currency writer would imply. We have the best authority for stating that his lordship has given strict commands to his agent in this county, to reduce the rents of his tenants to that point at which he conscientiously believes they will be enabled to cultivate the soil at a fair remunerating profit. "Investigate the subject closely"—says his lordship—"but give the tenant a certain and effectual reduction." This shows that his lordship is at all events sincere in his opinion, and is prepared to back it, as a landlord who deprecates the currency question ought, with sacrifices from his own rent-roll. In conclusion we must observe that this bespattering with contumely every man who will not consent to an alteration of the currency, is but ill calculated to insure the stability of the Central Agricultural Association, or promote the objects for which we thought it was originally established.

The facts having been disputed which we lately adduced in forming a comparison between the British and French farmers, stating that though the English currencies of Wheat exhibited a greater depreciation than those in France, yet the prices of rye, barley, oats and pulse, have to the utmost participated in the latter kingdom, in the decline of wheat; live stock also realising proportionably less rates, while in England summer grain live stock and wool, have been selling at much higher relative prices than those of wheat; we have now annexed the comparative currencies of grain and meat at Paris and London, taking even the high quotations of wheat for the past week, which fully corroborates the previous statement.

**PARIS.**—Wheat per qr., 25s 2d, 29s 9d, to 35s 10d; Rye, 14s 7d, to 17s 9d; Barley, 14s 7d to 16s 2d; Oats, 14s 7d, 17s 1d, to 19s 2d.

**LONDON.**—Wheat per qr., 39s, 45s to 52s; Rye, 32s to 36s; Barley, 23s to 36s; Oats, 18s, 24s, to 28s.

Comparing the highest price realised for meat in England, and the rates in France, it appears that in London beef is 1s to 1s 2d per stone dearer; Veal 10d to 1s 2d; Mutton, 4d to 6d, and Pork 1s 6d to 2s per stone.

## ON WEEDS\* IN CATTLE.

BY MR. M. POTTIE, YOKER, NEAR GLASGOW.

(From the Veterinarian.)

In my practice there occur a great many cases of what are termed weeds in cows. The principal part affected is the udder; but the disease is not the same as the ordinary garget, or udder clap. Garget begins in the udder; weed is preceded by some internal commotion. The mode in which I treat this latter affection with most success is rather at variance with the rules prescribed by the prevailing doctrines of the present day; and it is, therefore, that I beg to offer one or two brief remarks.

The cow takes a shivering fit, which may last from two to twelve hours. This is succeeded by a hot fit. The temperature of the body rises, sometimes slowly, at other times quickly; the cow hangs her head, and refuses food; her eye is red, pulse quick, breathing a little hurried, and the back is arched. The cow, in short, is fevered. Before the hot fit is established, or very soon afterwards, the secretion of milk ceases, and a portion of the udder is hot, painful, and swollen. Subsequently an abscess forms in the udder, or one or two quarters become cold, black, and insensible. A large portion is dead; upon cutting into it no blood escapes, and no pain is expressed. The intensity of the fever, and the disorganization of the udder almost invariably bear a certain relation to the duration of the cold fit. The longer the cow shivers, the more serious are the ultimate consequences.

When I first commenced practice, I tried bleeding, purging, and the other auxiliary remedies against inflammation; and I dare say I frequently mitigated the violence of the disease: but I soon found that these measures would not arrest it. They would not prevent disorganization of the udder. Now, if the case is obtained in the beginning, while the patient still shivers, a single drench is all she requires. In a quart of hot water, or hot milk, give one ounce of the seeds of the caraway, and as much powdered ginger. Clothe the body, and give little food. The cow, in general, will be well next day. But if there be any dulness or constipation, let a purgative combined with an aromatic be given, and as much cold water as the cow will take. But let her not stand exposed to any current, especially after drinking. Chilled water is safer, but cows will seldom take enough; and rather than this should occur when purgation must be established, it is better to give the water cold, and drive them about for a little after drinking.

If the cow has been shivering several hours, and the udder has become affected, still the stimulant may be given. If pernicious at all, it is only after the fever is fully developed. After awhile it may be prudent to bleed, and it is good to give a purgative along with the stimulant. But if the udder has become affected, however slightly, these means will have little efficacy without much attention to the diseased organ. It must be fomented in earnest. Fomentation, as usually applied in cases of this kind, is a mere mockery. In the first place, the water ought to be so hot that the hand cannot remain, though it may be dipped in it. A large bucketful of this should be placed under the udder, and its

\* By "the weeds" the Scotch practitioners mean acute inflammation of the udder when the term is applied to cattle, and diffused inflammation of the subcutaneous cellular tissue in horses, and particularly in colts.—EDR.

temperature maintained by frequent supplies. Then it must be applied for an hour at a time, three or four times in the course of the day or night. A blanket or large woollen rug, and two persons to hold it, are requisite. Place one on each side of the cow, each having hold of the cloth, folded into a convenient breadth; dip the middle portion into the water, and let it be tightly and closely applied to the udder, so as to suspend as well as foment it. It need not be lowered oftener than once in eight or ten minutes. At the end of an hour, the udder and adjacent parts should be well and quickly dried with cloths. The tumefied portion of the udder should be rubbed with ammoniacal liniment, or with strong spirits: I sometimes use whiskey. Until the next fomentation, the rug or blanket is to be tied over the udder or loins, so as to suspend the udder. The wet warm cloth is to be covered by another, to prevent evaporation. The mild stimulant may be applicant after every fomentation, and the repetition of this process must be proportioned to the intensity of the inflammation. When the animal is tractable one person may apply the fomentation by tying the blanket over the loins and injecting the water under it. Poultices are not often useful. To do good, they must be large and moist; their weight is not compatible with complete suspension of the udder.

I know not the cause of weed. It is most common after calving, and during wet, changeable weather. Exposure to cold is the immediate cause of the shivering fit.

### TO THE EDITOR OF THE MARK LANE EXPRESS.

*Glasgow, March 7th, 1836.*

SIR,—Having received numerous inquiries from the South about wheat, and it not being convenient for me to answer them separately, I have thought of this method of answering them all at once, providing you will be kind enough to favor this with a corner in your most valuable paper; the parties cannot fail to observe it, being all regular readers of the Mark Lane Express.

In the first place, I cannot but congratulate you on the good weather you seem to enjoy in the South, it is very different here,—almost constant rain or snow, with occasional touches of frost, are what we are experiencing.

As regards the last year's crop of wheat then, except in the South of England where the weather was dry and warm, it turned out a very inferior one, as regards quality; in the North, and especially all over Scotland and Ireland, the season was generally cold and wet, and the wheats got in in inferior damp condition, a considerable portion is so much out of condition as to be fit only to be given to the cattle; in this quarter we are obliged to procure supplies of good dry samples from the South to mix with; the low price, too, of wheaten bread, in comparison with that of oatmeal and potatoes, has caused a great extra consumption of that article, so that before another harvest I fear we shall have but short supplies and high prices. Shall we be relieved, then, when the next harvest is reaped, should the season prove favourable? Not as regards wheat, for the usual quantity of it is not sown, the low price of the preceding years has induced the farmers to sow other sorts of grain and produce this season in preference; I speak of Scotland and Ireland particularly. Take, for instance, the Linlithgowshire Agricultural Report for last month as a specimen; it says, "The young wheats, which do not much exceed one-third

of what was sown last year, look sickly from the long tempestuous wet weather; from these circumstances, and when all the other great staple articles of the kingdom are at such high rates as to afford an opportunity of investing money in them to advantage, it is rather surprising that more should not be doing in wheat, for notwithstanding the late advance from the low point to which it had reached, it is still at very low rates, and with an inferior present crop, great extra consumption, and a different crop in prospect, I should say that there is no article so safe at the present rates, or one under all circumstances more likely to yield a handsome return for the money invested than good wheat.

I remain, yours, respectfully,

A CONSTANT READER OF THE  
MARK LANE EXPRESS.

**TURNIPS.**—There are three most essential requisites to obtain a good crop of Swedish Turnips. First, the land must be congenial to the growth of them—clean, full of mould, and not very clotty. Secondly, a proper quantity of good manure, well covered in the land, and not exposed to the atmosphere so as to lose its nutritious qualities. Thirdly, seed raised from a sort proved to be good, drilled at the proper depth and distance, and at the proper season. With these indispensable requisites, with favourable weather, and if the plants are not injured by the fly, and well hoed (twice or thrice, if necessary,) a good crop of Swedish turnips (which is of greater value than it is generally supposed,) is almost sure of being obtained; but if there is a deficiency of any of these requisites, it will be advisable to sow common turnips, and if there should be a deficiency of most of them, not to sow any; for half a crop of turnips, with a full crop of weeds, puts the land into a bad state, and by expenses takes money out of the farmer's pocket for as wasteful purpose as if he ploughed the cash into the land. Swedes wanted for stall feeding should be sown the latter end of May; for sheep feed they may be sown as late as Midsummer; common turnips from Midsummer to the middle of July. The greatest weight of Swedes is to be got drilled on ridges, twenty-seven inches asunder, and left twelve or fourteen inches apart. For sheep in the spring, drilling on a flat surface, in rows fourteen inches asunder, care being taken that the manure is well covered, answers very well, and the turnips are not so liable to be injured as Swedes even sometimes are, during a winter with a repetition of frosts and thaws. By having nearly twice as many turnips on the flat as on the ridges, it might be supposed that a greater weight might be produced. I have tried the two ways, both sown at the same time, and found the ridged turnips so much larger, that they produced the greatest weight per acre. A Swedish turnip is doubled in weight by a small increase of its girth.\* I have often been somewhat incredulous as to some of the reported weights per acre of Swedish turnips; for having been for some years past in a sweepstakes with Lord Althorp, I consider, from the weights we have produced, five and twenty tons per acre a good crop for regular tillage land that has, the previous year, borne a crop of white grain. I recommend that land intended

\* With Northumberland ridges a certain degree of fallowing is carried on during the growth of the turnips. As to a broad-cast crop of Swedes, I think that quite out of the question with a good system of farming.

for turnips—but think it not so necessary for corn—should be ploughed up at the beginning of winter; and, if it is free from couch and intended for Swedes, a small quantity of dung ploughed in (not too deeply), will produce good effects. After numberless trials to prevent the ravages of the turnip fly, the only way which I found at all successful is, to collect all the weeds I can find on the farm, and lay them in heaps all round the field sown with turnips; on the plants coming up, and showing the least appearance of being attacked by the fly, the heaps to windward are set on fire, brimstone is put in the fire, and thus the strong smoke which is very offensive to the insect, is wafted over the crop. If this is continued till the turnips get into rough leaf they will be safe. No one has yet been able to prove where the fly is produced. Some assert that it comes out of the earth; others, that it is bred in the seed. I made an experiment two years ago, which satisfied me, and all those I showed it to, that it comes out of neither. When my turnips were sown, I covered a piece of land with a large square of thin gauze, which I so fastened down that no insect could creep under it. Under the gauze, the turnips were not touched by the fly; all round it, they were eaten and destroyed by it. Where the insect is generated, is not known; it flies in the air like other insects, and although it may appear strange to us, it has the power to discover that there is food for it as soon as the turnip leaf appears above the ground. Most Swedish turnips run too much to top, and produce many worthless fangs at the root. By getting, a few years ago, seed from Sweden, I have got a kind that produces a small top, with tap root only; and having widely circulated my seed, the Thorpeland Swedes are well known in many distant counties. Each year I sow a small quantity of any sort well spoken of, but have not yet met with any I like so well as my own.—*Hillyard's Summary of Practical Farming.*

### MANGEL WURTZEL.

*To the Editor of the Irish Farmer's and Gardener's Magazine.*

SIR.—As I have these last few years perceived that the Irish farmer is beginning to appreciate the value of winter green crops, and to understand their mode of cultivation, I hope you will consider a few observations on mangel wurtzel worthy of notice. Having grown a great variety of those crops, I have fully ascertained the merits of each respectively. Mangel wurtzel merits a very high rank among bulbous roots, not only for its nutritious properties, but from being much suited to milking cows, and if judiciously given, not injuring the flavour of the milk. It is also a valuable root for feeding cattle, and will also feed store pigs, with a small proportion of steam potatoes occasionally. There seems, however, to be some difference of opinion as to the relative value of this crop and Swedes for these purposes; some maintaining that the former is the best, and others the latter. For myself, I think the choice should be made according to the nature of the soil on which these winter greens are to be sown; if strong, deep and loamy, mangel wurtzel will be most productive, but if gravelly, light, or porous land, the crop will be uncertain, and not of half the weight or produce as if sown with Swedes; it also would require double the manure to raise it. No doubt there is more risk in the Swedes being cut off by the fly, which makes it a more precarious crop than mangel on any soil; but this enemy is not so destructive in our climate as it is in England; therefore, if the

land be suited to its cultivation, this objection can be counteracted by good management, which I purpose more fully to point out in a communication to you next month. My object at present is to show on what soils mangel may be planted with success; the time and mode of doing this work, also the treatment of the crop while growing.

As I have stated, strong and deep land is most suited to this plant, but any soil, if sufficiently fertile, may, by deep ploughing and a sufficient quantity of farm-yard dung, be made to produce a fair crop. The matter then to be considered is, whether to embark on this extra expense, in order to attain mangel wurtzel on inferior soils, or to cultivate Swedes or other turnips, which could be raised on such soils by a much less quantity of manure, and in many cases, by peat ashes, bone dust, burnt clay, or a compost heap, none of which will be half so expensive as farm-yard dung. I am decidedly of opinion, that the crop should be suited to the nature of the soil; otherwise, it is not only precarious, but will seldom remunerate the cultivator. Mangel wurtzel is a more exhausting plant than Swedes, and the necessity of carting it off the land for consumption, makes it still more so; whereas, Swedes may be consumed by sheep on the land, and consequently much improved in this way. On rich and deep soil, however, I have always found mangel much more productive, and is still more so from the large quantity of leaves it throws out in the autumn, which is likewise excellent food for milch cows. Indeed it may be safely calculated, that this crop will yield one-third more food than Swedes on good land.

It appears to me, that the great error which farmers fall into in Ireland, is sowing mangel too late, and Swedes too early. The seed of the former should be put into the land in March, and the latter not till the end of May, or early in June. I have ascertained this fully from the most practical farmers; and especially as regards Swedes, the time of depositing the seed must be observed, to ensure a good and productive crop. If sown early on rich soils, the leaves become mildewed about July, by which the plants are much checked in their growth, and on arid or light soils the bulbous root will get hind-bound and stunted, and will not afterwards grow to a good size; the rind will also become thick, and the bulbs mis-shapen.

The best mode of managing a crop of mangel is to prepare the land in drills, about three feet asunder, in the same manner as for potatoes; and when the dung is covered in, and the drills rolled down, to dibble the seeds, two in each hole, at six inches distance in the drills, and if on strong land to close them with a garden rake, or if on light soils with the roller. This will ensure sufficient plants, even should an unfavourable season follow, which, when strong enough, should be hoed out at twelve inches distance, leaving the plants to stand singly.\* During this process all weeds should be cut away, and if the land be foul with couch or other root weeds, the horse hoe should be used in the furrows, and the soil taken from the drills, and then thrown back

\* Great care should be observed not to deposit the seed of mangel too deep—half an inch on strong, and less than an inch on porous soils, will be sufficient. An implement is easily constructed for this purpose, to make four holes at the same time at the top of the ridge; or a common dibble may be used with a guard across, to mark the depth the seed should be put in, and thus the entire can be evenly deposited.

when the weeds are destroyed. If this is effectually done, a third hoeing will seldom be necessary.

The leaves from mangel may be taken off in the latter end of September, and the roots will throw out fresh ones before the severity of the winter. These roots do not resist the severity of frost so well as Swedes, therefore it is necessary to draw and stack them before they receive any injury in this way. The tops should be cut off within an inch of the crown, and either ploughed into the land for manure or given to the milch cows, or pigs. I have been informed by an experienced agriculturist, that when the roots are given to milking cattle, about two inches from the crown should be cut off, as it is this part of the bulb that causes bitterness in the milk—and this I think is worthy of attention. It is however advisable to give these roots in small quantities, at the commencement, using salt at the same time, and to correct their properties, by giving, at intervals, bran mash, grains, steamed potatoes, or other prepared food; as mangel in large quantities will no doubt be most injurious to the taste both of milk and butter.

Mangel wurtzel, steamed, will not injure the flavour of the milk so much as if given raw, and in this state is better food for pigs, some bran or dry food being added. It is not however considered near so nutritious or wholesome for sheep, nor so good for working horses, as Swedes or carrots; but, as our soil and climate are much suited to its growth, there is every inducement for its extensive cultivation. In cases where the seed cannot be sown in March, where it is to remain, it may be sown in a convenient patch of ground, and transplanted in May, and by this mode excellent crops are obtained, especially should a dripping season follow after the plants are set out. I have also often tried this system with Swedes with equal success.

I have not cultivated the yellow mangel wurtzel; but from what I can learn, it is not so productive, nor does it keep so well as the red, late in the season. The quality is, however, more saccharine, which makes it more valuable for feeding cattle. It may, therefore, be advisable to try it in a small proportion on deep and fertile soils, on which alone it should be cultivated.

AGRICOLA.

## ON BONE MANURE.

BY MR. M. M. MILBURN.

It has been said, that while our manufactures are constantly advancing, and improving, our agriculture is stationary. Now never was assertion more unfounded, and unsupported by facts. Any individual who has impartially examined the history of agriculture for the last twenty years, cannot but observe, that the greatest improvements have taken place, both as regards the management, the production, and the quality of agricultural produce. It is true, that further than the taking up of commons, and the reclaiming of wastes, the land has not been increased in extent, as the machinery of the manufactures has, but the labour has been diminished, other produce has been increased very considerably, and land, once thought barren and worthless, is now productive and fertile. The mode of management too, has undergone a complete revolution; materials and combinations, once wasted as useless, have been found to possess the greatest nutritive and fertilizing powers, and rendered available to agricultural uses. To nothing does this remark apply more forcibly than

to bone manure. Well may be remembered the ridicule which was cast on those who used it when first introduced, and the wonder of their neighbours when they saw its effects, and although that disposition to ridicule is more subsided, yet many are still remarkably sceptical as to their utility, and consider a trial of them to be a risk of the failure of the crop.

Waiving for the present the relative value of farm-yard and bone manure, there is a striking difference in the carriage, and laying the one upon the land, as compared with the other. Let it however be understood that what I say applies to the soils generally denominated "turnip and barley land" only, as to say that *any* manure, is equally favourable to *all* soils, is to claim for it a pre-eminence which is in fact due to none yet discovered, nor indeed is likely to be due to any that ever can. To manure land with farm-yard manure is a serious consideration as regards cartage, both in reference to the expenditure of time, and labour;—it is to be carted from the yard to the mixen, there to be turned; then to be led and spread upon the land. The farmer too is anxious that his land shall be manured in as little time as possible after it is ploughed, lest the drought should so penetrate the soil, as to prevent the germination of the seed, but let him use whatever activity he may, in using putrescent manures, it must occupy considerable time. Here then appears one of the advantages of bones; a pair of horses will bring at one time as much as will manure five acres of land, and can with the seed be drilled upon the land in three hours' time. Bones possess another advantage over farm-yard manure, and it is this. Dung, especially when fresh, as recommended by Sir Humphrey Davy, lightens the earth, and exposes it to the effects of the drought; a serious defect in a dry season, while the difference produced by bones is scarcely perceptible. The farmer may however justly urge that he has his manure, and it must not be wasted, while he has to buy his bones at a rate considered dear; this is quite true, but it is equally true, that it is by far too common for farmers from mere parsimonious motives to "make their manure do," and lay out as little as possible in the purchase of any other, forgetting that this is eventually his own loss; let him use his manure as far as it will go, and let him lay it on pretty liberally,—let him purchase bones for manuring the rest each alternate rotation, and he will find himself very considerably the gainer.

Hitherto I have gone on the supposition that bones and dung possess equally fertilizing powers, but I think experience has proved that upon light sandy soils, the former has a most decided superiority, and particularly so when the soil slightly inclines to peat. To enter into a chymical disquisition of the properties of bones, would be uninteresting to the new practical farmer, I shall not therefore, attempt it, in the present article, but endeavour to show to the practical man, from actual experiments, its effects upon different soils, and in relation to other manures.

The first experiment was made upon a shallow sandy soil, inclining to moor. The bones were "half inch" and drilled upon the land, along with the turnip seed at the rate of two quarters, (sixteen bushels,) per acre, along with a small quantity of quick ashes. Upon another part of the same field, and adjoining to the above, two or three lands were manured in the usual way, with farm-yard manure. I cannot precisely say the

weight of the manure laid upon the land, nor indeed is it material, but as a proof that it had a sufficient quantity, I need only say that the person who spread it upon the land, had very strong prejudices against bone manure, and laid on rather more, than less, than usual, declaring that "he would give them a fair trial." The result was, that the turnips sown with the bone, had the most decided advantage over those sown with the other manure, inasmuch as the furrow to which it extended could be distinctly marked out. It has been said that bones are valuable as a manure only to the crop immediately succeeding their use, and that they do not affect any future crop, forgetting perhaps, that when the sheep-farmer has obtained his turnip crop, he has effected his purpose, as the eating of that crop on the land is the best management the soil can receive. Now, the barley crop that succeeded the turnips in question, was also decidedly superior to that grown on the dunged part of the field, and much excelling any ever grown upon the land previously, and the same distinction in favour of the bones was perceptible even to the clover ley which followed.

The second experiment was made on a sandy soil, rather inclining to gravel, and having a considerable portion of iron in its composition. The bones were drilled, at the same rate, (sixteen bushels per acre), without any ashes, or other manure; and in the same field some seed was sown with well rotted dung, and the rest with a compost of fresh soil, and stable dung well mixed. Over the former, the bones had considerably the preference, but between them and the latter there was no comparison in their favour.

Experiment the third, was made on rather a stronger and deeper soil; more tenacious but not clayey; drilled at the same rate per acre as in the former case, and also without any ashes, &c.; and on an adjoining piece of ground, in the same field, the turnips were sown with manure in its fresh, unfermented state, as recommended by Sir H. Davey in his lectures on Agricultural Chymistry. The boned turnips here, however, were rather smaller, than in the two former instances, and not quite so luxuriant; but between them and the fresh dunged ones, there was no comparison, indeed they were undeserving the name of a crop. Now the above experiments were carefully made, and with practical views, and occurred in three successive years, and so satisfied was the person who tried them of their value that he now employs them constantly, and never have they been known to fail except in a single instance, when they were taken off by the grub, and to which I shall presently allude. It may be remarked, that in all the above instances, the turnips were firm, regular, and covered all the land, though they were not so large in bulb, as when sown with other manure.

A comparison has been made between home and foreign bones, to the disparagement of the latter; it has been urged that the foreign ones have been laid long in the earth, or bleached in the heats of a continental sun, and are to appearance so dry, as to be almost deprived of nutritive properties; while the former are full of their fat or juices, and to some of them are even attached coagulated blood, and the remains of the muscles. This may at first seem convincing, but in one of the cases above alluded to, they had a fair trial given to them; part of one of the fields in question, was sown with one kind, and part with the other; the difference was slight it is true, but there was a difference, and that in favour of the foreign. A no-

ment's reflection will give a reason for this. All manure must be so decomposed as to separate the fibrous, from the soluble matter, before it can become in a state for acting as food for plants, and all the advantage of bones in the abstract, depend on their fermentation, and consequent decomposition. For the old and partly decomposed foreign bones, are sooner in the state required to become food for the young turnip plants, than those which are fresh, and although in the latter there was a greater quantity of fat, &c., even that, must undergo considerable changes, before it can act as aliment to the plants. What does the farmer learn by this? That if he uses recent bones, he must also use other stimulants to the soil, in the form of lime, or manure, or he must drill them with ashes as they materially expedite the growth of the young plants until they get out of the way of the beetle. Here I may remark, a reason is offered, why bones are the most profitable in light sandy soils. Sandy soils are by far more adapted to decompose any vegetable or animal matter with which they may happen to come in contact, than any other, and the truth of this is proved by the frequency with which they require to be supplied with manure, and hence bones are in such soils more rapidly and easily decomposed, and rendered available for vegetable nutriment.

*Thorpefield, near Thirsk, Yorkshire.*

*(To be continued.)*

SIR R. NEWMAN.—The elevation of Mr. Newman, of Mamhead, to the Baronety of the United Kingdom, has excited the greatest satisfaction in the minds of the liberal party in Devon, without the slightest feeling of disapprobation being manifested even by the Tories. Sir Robert is a man of great wealth, but this is the least of his merits. He is a sound, liberal, and consistent politician, a kind landlord, in the truest sense of the word. Not a rent discounter, throwing back 30 per cent. of that which he knew he could not expect to receive; but regulating his rents by the good old English maxim of "Live and let Live." He formerly represented the city of Exeter for about fourteen years, with a consistent patriotism that has endeared him to the people of that city. He is a man of refined mind and amiable manners, and his place at Mamhead is one of the finest in the West of England. Mamhead Hall, which he has just finished (at an expence of 100,000*l.*, it is said), being one of the most classic specimens of Tudor architecture now in existence. It stands in one of the finest sites in Devon.

BREAD CUTTING MACHINE.—On Friday, we had the pleasure of examining a newly-invented machine for cutting loaf bread, the credit of which is due to Mr. Blaikie, an ingenious gun-maker in Glasgow. It is being exhibited at present in a house in East Register-street. In its machinery it is quite plain and simple; and nothing could well be more easy and satisfactory than its operation. The loaf being placed in the proper receptacle, the operator raises the handle of the machine, when, by a simultaneous motion of the internal machinery, the loaf is shifted forward to the proper place, the size of the slices having been previously determined by fixing the index hand of the regulator at the desired distance. The handle being then brought down, the slice falls into a box beneath. A quartern loaf may be cut in this manner in half a minute; and cut too as smooth and even almost as polished marble, and without breaking it into crumbs, as is unavoidably the case by cutting bread in the ordinary way.—*Scotsman.*

## EXTRACTS FROM A RUSSIAN CORRESPONDENT.

*St. Petersburg, 1st October, 1835.*

Russia is essentially a new country, presenting inexhaustible resources for agricultural enterprise: her territory extends beyond the region of vegetation northward to the genial clime of the silk-worm and olive, including millions of acres of the finest land untracked by human footstep—even a very great proportion of the vast domain of the nobility is neither pastured nor cultivated. So prolific is the soil under the worst description of management, that a good harvest reduces corn prices below the cost of production. Some years ago I had occasion to visit one of the provinces of the Ukraine, called the Granary of Europe: at that time a quarter of rye cost 3s; of oats, 1s; of wheat, 11s; a fat sheep, 2s 3d; and an ox ready for the butcher, 25s to 27s; 15,000 acres of the finest land were let for the season for pasturing large herds of cattle destined to be killed for their hide and tallow, at 1s 2d per acre; the best beef was ¾d per lb. Formerly large quantities of corn were exported from the Baltic and Black Sea ports—that export is now very limited, as countries more favourably situated by their geographical position, and producing excellent corn, as France, Belgium, Holland, the countries watered by the Rhine, the Elbe, Denmark, Pomerania, Prussia, and Poland, are amply capable of furnishing to Great Britain whatever supply a bad harvest may render necessary, before our inland communications are released from the iron chains of an Arctic winter.

The Russian corn trade is now very insignificant: two failing harvests in our principal grain districts, and consequent high prices, induced foreign speculators to seek other markets; and except what is shipped from Odessa to the markets of Turkey, the Levant, and the coasts of France and Spain, in the Mediterranean, the commerce in corn for export is very insignificant and confined to home consumption. Under these altered circumstances, many of our landed gentry possessing estates exceeding in extent an English county—even Yorkshire—have become sheep breeders, and possess flocks of Merinos varying from 10,000 to 50,000. I know two Frenchmen, who have more than 100,000 fine-wooled animals; and one admirably regulated German establishment, which received some weeks ago 230 pure Electoral Saxon rams as a remount. Besides the low prices and diminished export of corn, other causes influenced the great extension of wool-growing. They are—the great increase of cloth manufacturers in Russia; the transfer of many of the Polish woollen fabrics within the Russian territory, great privileges and encouragements being granted by the present Minister of Finance to manufacturing industry; the settling of many Austrian, French, Prussian, and Saxon sheep-breeders in the fertile provinces of the South; the better management of flocks by Saxon and Austrian shepherds; the better preparation of wool by these foreigners, it being now produced on many estates, washed, sorted, and packed in the Saxon manner, sent by the frontier to the great fairs of Olmutz, Prague, Leipsic, &c., where it is sold, and finds its way to Hamburg and Holland, to Belgium, France, England, and America, as wool of Saxon, Prussian, or Austrian growth. Under such improved circumstances, the demand for Russian wool has greatly increased; and it is quite clear that Russia, ere many years, will become a leading mart for the wool trade of Europe; the cheapness of production, her favourable climate, and vast resources, insure her this important place.

Nothing is wanted but a greater share of knowledge dispersed amongst the majority of her landowners and their agents. Much fine is also sent by the sea from Odessa; a less proportion of fine, and a very large quantity of coarse, are forwarded by St. Petersburg; and Russian wool, scarcely known six years ago beyond the frontier, is now seen in large quantities in the principal markets of manufacturing Europe. There were shipped at this port last year 6500 bales—up to this time the number is trebled. An American, who has already shipped twelve cargoes from Hamburg this season, is now purchasing largely. Besides the immense flocks of Spanish and Saxon sheep in Russia, there are vast numbers of middle and coarse woolled animals found in every province, belonging to small farmers, the peasantry and the wandering tribes of Tartars, Calmucs, and other nomadic races, who exist in the interminable steppes of the countries bordering on the Black and Caspian Seas, and watered by the majestic Volga and other noble streams. These people possess herds and flocks of camels, horses, horned cattle, sheep, and goats, hundreds of thousands strong; and they sell their tallow, hides, horns, wool, downy hair, at the periodical fairs of the interior. The flesh is cast to the winds.

Some small lots of long-wooled Leicester, Lincoln, and Teeswater sheep have already been introduced into Russia, and are doing well. A parcel of Leicester wool, grown in this neighbourhood, was lately sold here at 1s 10d per lb, washed on the sheep. A flock of 600 Teeswater, settled in one of the mildest provinces, is prospering. Samples of this wool have been circulated amongst our leading amateurs, and has found much favour, it being much softer than the Leicester, and equally long. Long-wooled sheep are not wanted here for their Smithfield qualities: the pigeon and the sheep, being typical of holy things, are little eaten by this people. The animal which will find favour here must have a long, heavy, soft fleece. Even a lot of twenty-five Lincolns, bought near Wisbeach last May, were shorn here; they yielded 13½lbs of wool in the grease, and found much favour with our amateurs. Merino wool sells now from 2s to 2s 3d per lb; the superior clips reach 2s 8d; they are very coarse, coarse wool, cleanwashed for export, is 10 per lb. When it is considered that land is almost rent and tithe free, and exempt from taxation—that labour is extraordinary low, and nine-tenths of it done by vassals, you will conclude that sheep-breeding is profitable, when conducted systematically, and by well-informed persons as flock managers. Much however remains to be done before such a consummation. Great part of the wool produced in Russia is sold at provincial and local fairs, whither it is brought in the most filthy state. Much of it is torn from the backs of the animals; then it falls into the hands of the middle-man, who washes, sorts, and packs it for sale to the manufacturers, the wool-merchant, or the exporter. Itinerant merchants contract for large quantities of wool before clipping-time, on very favourable terms; and large fortunes are rapidly acquired by all those connected with the trade in wool—the producer, the itinerant agent, the middle-man, and the manufacturer. The trade is yet in the first stages of its infancy; and I do not hesitate to say, that if sheep-breeding, wool-sorting, and the commerce of wool, were undertaken on a respectable scale, in a favourable situation, by competent persons having ample means, a gold mine would be open to them.

It is difficult to convey a correct notion as to the general character of sheep management, as it varies in different provinces, green food for winter is rarely

provided—in the south, never; hay and straw, with a sprinkling of salt, are the luxuries of Russia Merinoes. In the Baltic provinces, where the landed gentry are decidedly amateurs, and generally well informed, potatoes, beet-root, and carrots are grown for the flocks; they get also the refuse of the distilleries, which are very numerous, and almost invariably found on large estates. The soil and climate of this district are favourable for sheep-breeding; and the Leicesters are already there in small numbers; and a society for improving wool is established. The pastures of the South are exceedingly abundant, luxuriant, and aromatic: the latter quality they contain in an eminent degree. Many peasants possess several thousands of bee-hives, and conduct an extensive commerce in honey and wax, &c. &c.

ACCOUNT OF ALSIKE CLOVER (*TRIFOLIUM HYBRIDUM*.) BY MR. G. STEPHENS, Land Drainer, Edinburgh.

This plant was first discovered growing luxuriantly on the sides and in the bottoms of ditches, at Alsike Inn, ten miles from Upsala, in Sweden. It was named, classed, and fully described by Linnaeus, in his *Flora Suecica*, at page 258. It has since been described in the botanical works of Liljeblad, Hartmann, and Wahlenberg, and of Danish and German authors. Its trivial name, *hybridum*, is derived from its appearance being something between that of the common red clover (*T. Pratense*), and the common white (*T. repens*); but it is quite a distinct species, and easily distinguished from both; nor does cultivation alter its character. It was supposed to have originated from the accidental union of those two species, and it is probably for this reason that it is called Bastard clover, in the second volume, No. 129, of *Swedish Botany*, where it is accurately delineated, and its usefulness as an agricultural plant fully described. It is also described in the *Swedish Royal Patriotic Agricultural Society's Journal* of 1780 and 1782, as a plant well worthy of the attention of agriculturists. Its properties of growing higher, having its leaves more luxuriant, and striking its roots deeper, and remaining longer in the ground than the common clover, render it not only suitable for hay, but for laying down land to permanent pasture. The hybridum grows wild in Finland, Denmark, Germany, France, the northern part of Italy, and Portugal; but it has never been discovered growing wild in Great Britain. It is likewise partially cultivated in Denmark, Flanders, Finland, and some of the German States, where its hay is generally mixed with straw; in which state it retains its colour and smell, and never moulds. I have known the plant a considerable time, but never paid particular attention to it, till during my annual visits to Sweden in the last three years, when I observed its growth, and the soil on which it thrives best. Its natural soil is a calcareous loam, which effervesces with vinegar. When cultivated, it grows well in mild soils that are properly managed. Baron Wrangel of Akerby, in the province of Nericia, who has cultivated it for more than twenty years, says that, "if sown in well managed land of not too strong a nature, it yields a crop of hay of from 360 to 540 imperial stones per imperial acre, for ten or fifteen years successively, but the land must not be grazed by sheep or horses during the first two or three years." The

seed is sown early in spring, before the ground gets too dry or the wheat too strong (being sown among wheat or rye), and it comes to perfection in the third year; but as the crop is often heavy, and when the weather is showery, it is inclined to fall down, a small quantity of Timothy-grass seed (*Phleum pratense*) is generally sown along with it, to support it and insure a full crop in the second year. The cause of its failure in the second year, in Sweden, is, that the summer months being generally very dry, the drought prevents part of the seed springing till the autumn or following spring. But the climate of this country being more moist, it is reasonable to expect that the whole of the seed sown will spring at the same time, and consequently produce a good crop the second year. The roots of this species of clover, going deeper into the soil than those of the clover plants now in use in this country, will enable it to resist the uprooting effects of the alternate sunshiny days and frosty nights which prevail here in March and April. This plant throws up many stalks from the same root, which are not so strong as the common red clover, but stronger than the white, and having more lateral branches than either. The lower part of the flower is white, fringed round the upper extremity with a red ring, which gives the plant when in full flower a beautiful appearance. The plant possessing these hardy characteristics in Sweden, there cannot be a doubt of its being a perennial, which will stand our changeable climate better than any other trifolium hitherto cultivated in Great Britain, and with our superior agriculture, the crop will be here equally, if not more productive, than in its native country. All kinds of stock eat it eagerly, either in a green or dried state, which is a sure indication of its nutritive properties. I sent a small quantity of seed to the Highland Society last year, which Mr. Lawson informs me he has cultivated with success, and I also distributed some among various gentlemen for the purpose of experiment.

[The genuine Linnean plant of this name does not grow naturally in Britain, Sir James Smith having ascertained that the *T. hybridum* of Hudson's *Flora Anglica* was not the plant of Linnaeus. Mr. Lawson has cultivated a small quantity of this clover for two years at Meadowbank Nursery. In the first year the seed was sown on the 17th April 1834, produced flowers on the 25th August, and ripened the seed early in October, the height of the plants being twenty inches. In 1835 the same plants were in full flower on the 18th June, and ripened seed early in August, the height being two feet. The forage was abundant, and eaten greedily by a horse. Its botanical characters are:—head globular; stalked; pods four-sided; tuft of the calyx nearly equal; leaflets ovate, and a little serrated; stems branchy; habit of growth not so upright as red clover; roots fibrous. Loudon states its introduction in Britain in 1777, and that it is described in Michell's *Nova Genera Plantarum*.]

YORKSHIRE.—Upwards of 1,300 valuable trees were blown down, during the late awful gales which visited the eastern coast, in the Earl of Tankerville's park, at Chillingham. At Alnwick, the well-known and largest ash tree in the country, called the Broom-tree, and supposed to have been planted 400 years ago, which stood in the churchyard, was torn up by the roots during the recent gales, carrying away the wall, and doing much damage.

## MANAGEMENT OF BEES.

(To the Editor of the Perthshire Courier.)

SIR,—By inserting the following directions for the management of bees during the spring months, you will, besides obliging the subscriber, confer a benefit on a certain class of the readers of your widely circulated paper.

About this season of the year, when the weather becomes somewhat mild, the bee master ought to have every hive in his apiary lifted from the stool and their state examined into—both as respects their external as well as their internal condition, to examine as to whether the bees are in a healthy state, and as to their being a sufficient quantity remaining to enable the bees to outstand, it may be an inclement spring, and also to clear away from the stool any filth that may have been contracted there during the winter, and to see that the hive be well protected from the severity of the weather. If the hive weigh 20lbs. Dutch or thereby, it may safely be presumed that no assistance is necessary, and it may be re-placed upon the stool, plastering up the skirts as formerly. If it should not, however, weigh more than 15lbs an additional supply ought to be given occasionally during March and even April if the weather be unfavourable or vegetation late. Indeed when the spring is backward, I would recommend that some honey be given those hives that are considered to have plenty of provisions, as it not only enlivens and exhilarates the bees, but enables them to have their brood much farther advanced than they otherwise would. If the weather be open and mild, bees commence working about the beginning of March, but much depends upon the situation as well as the earliness or lateness of the season, that is to say, whether vegetation be in a forward or backward state.

Some hives, when examined into at this season of the year are found almost destitute of inhabitants—although pretty well stocked with honey—and the novice in bee-husbandry is at a loss to comprehend the cause. This apparent desertion might arise from various causes. Some hives by reason of their long confinement by cold and stormy weather, become unhealthy and diseased, and at length, when the weather permits the bees to venture from their hives, being unable to fly, they tumble over the stool in great numbers and soon die upon the cold ground. Other hives are deserted on account of their having lost the Queen, and when her death occurs in the winter season, the bees being unable to raise a new Queen from want of larvae, the loss is irreparable and the bees gradually quit the hive. There are many hives too, which, in the earlier part of the spring, appear to be strong and vigorous enough, but, by the end of that season, instead of having increased, they have considerably decreased in number. On examining such hives I have invariably found a Queen, but the workers were very few. The cause of this decrease was quite evident—for scarcely any young brood could be noticed in the cells. From this it might be reasonably conjectured that the Queen was somehow or other diseased and unprolific. Such hives however if reinforced by some four or six thousand bees in swarming time, may turn to good account by the end of the honey season. It is to be regretted also that many hives perish by famine, that worst of all diseases, which it is in the bee-master's power to avert, but from his carelessness and negligence in not attending to their wants are allowed to go

to ruin. Particular care should be taken by bee-masters in the spring when the ground is covered with snow to confine their bees, by fixing in the entries of the hives perforated lead, as the influence of the sun often entices the bees to go abroad, and numbers of them by alighting upon the snow get benumbed and soon perish. Often before an apiary have I seen hundreds of bees perishing upon the snow from the owner's inattention in this respect. In winter, hives should have very small entries, as warmth is of the utmost consequence to bees. The apertures should not be larger than what is sufficient for the ingress or egress of two bees a breast. For this purpose small pieces of wood ought to be fixed in the entry, that, as the season advanced, it could be enlarged as required. In the spring too, when the weather is mild and when but little provision can be collected in the field, strong hives are apt to fall a plundering and pillaging their weaker neighbours. When any the smallest symptom of robbing appears, the first step the bee-master ought to take is to narrow the entry, which will probably enable the infested hive to repel their invaders. If this plan however do not succeed, the hive must be removed to another apiary not less distant than a mile, otherwise there is every chance of its being totally ruined. When the months of March and April are over, then does nature's lap teem with opening flowers, almost to exuberance, from which bees can extract the sweet nectar abundantly, and then may the bee-master exclaim in the words of Bonnar—'Farewell famine, farewell robbers.'

I am, &c. L——, a Constant Reader.

*Banks of the Tummell, 4th March, 1836.*

SHEEP are most assuredly a highly important and necessary stock, on all arable farms. They benefit the strong soils by Summer folding; and the light soils by their treading and their dung, whilst consuming green crops. Excepting for fat lambs, none but Leicesters are bred in this county, and a great many of them, in my opinion, have been bred too fine; they are very handsome and get very fat, but are too short and too fat on their loins and fore quarters for the London market, which is our chief dependence for the sale of our mutton. They are now, however, getting them longer, with more lean meat, so as to make a good saddle of mutton; and getting rid of thin necks, which generally denote delicate constitutions. My idea of a useful sheep is, that it should have a long, straight, and flat back, a good scrag, and head up, good fore quarters, and good inside thighs to produce good legs of mutton, and with all these, a good fleece. Till within about five and thirty years, it was the custom in this and adjoining counties, to keep the wether sheep till they were about three years old. On the introduction of the Bakewell breed, they have been sent to market at about two and twenty months old; but within the last year or two, it has been found that by cutting Swedish turnips in the field for them, they may be fat enough to go to market at fourteen months' old. If this practice should become general, an immensely larger number of sheep will be bred, and in many cases, this further advantage will be gained:—most fields have parts of them where the corn and turnips grow weaker than on others; these parts may be assisted by having turnips grown on the stronger part consumed on the weaker. Connoisseurs will say, such young meat is not so good-flavoured; for eating in winter, when all meat should be well kept, it may not be, but for summer, when it must be eaten fresh or be liable to taint, the

youngest meat is the most tender and best. It must be admitted that the South Down mutton from age is the finest-flavoured meat, without being too fat in the prime part, the back, but South Down mutton fed in Northamptonshire will not have the same fine flavour as that fed on the South Downs; the animal there is kept in great exercise while procuring its food, and is much longer getting fat; thus its flesh becomes faster upon it—like a horse in good condition—and not so frothy as the flesh quickly put on. It is from this cause, in my opinion, that the South Down mutton has acquired its celebrity for fine flavour. I am convinced we can in this county make a much greater weight of mutton per acre with Leicesters than with South Downs; but for the purpose of folding, to manure large arable farms, there is no breed of sheep equal to the Downs. Leicesters are more indolent animals; they like a good bite to fill their bellies quickly, and lay down to rest. The South Downs are more on the move, herd much together, and lay their dung where it is not wanted, under the hedges. Full thirty years ago, I gave my opinion in the Farmer's Journal, that for different soils, and different parts of the kingdom, there were two breeds of sheep that were decidedly superior to all others, the South Downs and the Leicesters; and that opinion I now retain. Useful as sheep are for grazing, there should be store cattle kept with them; otherwise, all the fine-bottom grass of a pasture will go; and the top and coarser grasses left. It is dangerous in some pastures to stock so hard with sheep as to make them eat herbage which will disagree with them, and which they would reject if not pressed by hunger to eat it. Daises are injurious to young sheep and lambs, often giving them the gurry, which is attended with fever and thirst, and if they can get at water, they will drink such quantities as to prove fatal to them. Sheep will (excepting in very hot weather), do very well without any water. If at the time of lambing it is necessary that the shepherd's hand should be introduced it should first be rubbed over with some strong oil or spirit; from introducing into the ewe's inside a hand, sometimes almost as cold as a stone, many have been lost. Ticks and lice often so infest tegs in Winter and Spring, and make them so uneasy as to prevent their thriving; these vermin may be destroyed by opening the wool in two rows on each side, and putting in sheep ointment of half the strength of that used to cure the scab; or dipping them, all but the head, in a poisonous solution,\* which should afterwards be carefully thrown on ploughed land.—*Hillyard's Summary of Practical Farming.*

### DUTIES ON SEEDS.

The duty on the importation of foreign agricultural seeds is a subject, not unworthy the attention of Parliament, as the impost has been levied originally at the instigation of a few interested parties connected, most probably, with the more southern portions of the country, to the detriment of the rest of the agriculturists, particularly those in Scotland, where a considerable quantity of grass-seed is consumed, the system of succession crops requiring the renewal of the seed at least once in three or four years;

\* *Receipt for Dipping 50 Lambs.*—1lb of arsenic to 5lbs of soft soap boiled in nine gallons of water; then mixed with about 15 gallons or more of cold water, to make it the proper strength, which is ascertained by dipping in a live sheep-tick, and afterwards putting it on the palm of the hand; if it lives about one minute and then dies, it proves the mixture to be of a proper strength.

taking likewise into consideration the increase of live stock consequent on the rapid augmentation of the population, artificial feeds have been rendered a point of material interest to the grazing farmer. During the past week Mr. S. Mackenzie presented to the House of Commons a petition from some farmers in the northern districts of Scotland, praying for relief from the prevailing agricultural distress, and pointedly alluded to the exactions made on the imports of clover and other grass seeds. The amount of duty, as will be seen by the annexed statements, cannot have been sufficiently large to affect the revenue to any extent, whereas it acts directly onerous on those parts of the country, where in ordinary seasons such seeds cannot be ripened; it not only enhances the price of the home grown, but also of the foreign article, and induces the farmer often to use seed of inferior British quality from not having arrived at a perfect state of maturity, as he can obtain it at rather a lower price than the good seed which has been received from Germany, Holland, France, or America. Indeed the duties on some agricultural seeds are quite prohibitory; on Clover, Lucerne, Trefoil, in fact all grass seeds, it is 20s per cwt.; Mustard seed, 8s per bushel; Caraway, 30s per cwt.; Canary, 60s per cwt.; Coriander, 15s per cwt.; Anniseed, 60s per cwt.; Tares, 10s per qr. On crushing seeds the duty has been reduced to 1s per qr, as not considered materially to interfere with the agricultural interest, as we are almost totally dependant for Linseed and Rapeseed on foreign growth.—The quantity of Cloverseed received from abroad at the ports of London, Liverpool, and Hull, during the last six years is as follows:—

1830	1831	1832	1833	1834	1835
<i>cwts.</i>	<i>cwts.</i>	<i>cwts.</i>	<i>cwts.</i>	<i>cwts.</i>	<i>cwts.</i>
49096	148554	45308	38452	39792	51672

producing an annual average of 62,000 *cwts.*, or as many pounds sterling to the revenue, and taken out of the pocket of the farmer, who is the only consumer, with the chance of the failure in yielding a profitable return for his seed, which as he is more northerly situated becomes the more precarious. Again, as regards Tares, which form so valuable a resource for feed, we are obliged to import more than half the quantity of seed sown in this country, and the heavy duty of 10s per qr checks considerably the cultivation of the article.—We have annexed the importations of foreign Tares compared with those received from England, Scotland, and Ireland at the port of London, observing that at Hull the proportions in favour of the foreign article is much greater—

	1830	1831	1832	1833	1834	1835
	<i>grs.</i>	<i>grs.</i>	<i>grs.</i>	<i>grs.</i>	<i>grs.</i>	<i>grs.</i>
<i>British</i>	2725	2641	2947	3492	2179	5240
<i>Foreign</i>	5326	1641	6309	3188	5873	8272

The Tares grown in Germany and Denmark are all spring quality; the Winter Tare, though often sown from seed received from England, and the cultivation attempted in the finest soils in Holstein, which is the *garden* of Denmark, has gradually failed in the produce, owing to the severity of the winter. The Spring Tares, however, are generally of good quality, and large and fine from particular districts, especially in the marsh of Holstein, in Brunswick, the neighbourhood of the Saale, &c. We may conclude by observing, that Mr. Mackenzie shrewdly remarked, in asking the Chancellor of the Exchequer to repeal the tax on foreign seeds, he felt confident of the support of the President of the Board of Trade, as the hon. member had already laboured so praiseworthy in relieving all *raw material* from severe and excessive import duties.

DISEASES OF LAMBS.

These young animals are subject to a variety of diseases, either from insufficient keep, too much milk, or cold weather, allowing them to suck other ewes, or giving them cow's milk warm from the animal, which is apt to coagulate and form a hard substance in the maw, by which many good lambs are carried off.

**DIARRHŒA OR SCOURING.**—This is very destructive amongst lambs in some parts, from 24 hours to about a week old, and many die in six hours after they are taken. It for the most part comes on when they are about 24 hours old, and lasts about two days, in which time it mostly kills five out of six, if proper medicines are not applied at the commencement. This disease begins with severe griping pains, frequent purging, and the lambs very much blown up with wind in the stomach and intestines; and if the disease goes on for some time without relief, the diarrhœa becomes more stationary, the purging accompanied with a copious dejection of mucus of the intestines, with griping pains, and the young animal daily pines away. It is proper for the mother to have a gentle purge or two of the following form:—

Take,—Epsom Salts, two ounces.  
Elixir of Vitriol, one tea spoon full.  
Water, half a pint.

Give this to the mother and change her pasture. Then prepare the following and give to the lamb:—

Take,—Compound Cinnamon Powder, two scruples.  
Prepared Chalk, one scruple.  
Carbonate of Soda, one scruple.

To be given in a little gruel. This is of sufficient strength for a lamb from 24 hours to a week old, and it may be repeated every four hours till the symptoms are abated; or the following:—

Take,—Cinnamon, two ounces.  
Opium, one drachm.  
Ginger, one ounce.

Boil in three pints of ale for 15 minutes, and add,

Carbonate of Soda, two drachms.

Let this be strained off, and, when cold, two table-spoons full may be given two or three times a day. A lamb six weeks old may have three table-spoons full.

**COSTIVENESS.**—This complaint is mostly accompanied with fever; the lamb appears dull and heavy, and eats very little.

Take,—Epsom Salts, half an ounce.

Dissolved in a little water, with a tea-spoon full or two of castor oil.

If the lamb is weak and does not take sufficient support, it must have the gruel given to it as directed in page 16 two or three times a day.

**STAGGERS.**—The most thriving of the lambs are affected with this complaint, and it often proves fatal, especially when about three or four months old. Sometimes they are seized with a giddiness, fall down and cannot get up again without help. Sometimes they appear convulsed, and very much distressed. Lambs have been opened, that have been killed while in this way, when the blood vessels about the brain have appeared a little tinged and distended with blood, more so than in health. In this complaint, it is proper to bleed and give the following purge:—

Take,—Epsom Salts, one ounce.  
Elixir of Vitriol, half a drachm.  
Hot Water, two ounces.

To be given when cool. After the operation of this medicine, give the following ball, and keep the lamb under shelter:—

Take,—Calomel, four grains.  
Gentian, half a drachm.  
Syrup enough to make a ball.

**MGRIMS.**—This disease proceeds by breeding repeatedly from the same kind or family of sheep. When first attacked with this complaint, they run in a sort of canter about the pastures with their tails cocked, and if the hand be put upon the loin or back, they instantly sink down, which shows that the disorder is in the back. When sheep appear to be once affected with this disorder, it is dangerous to breed with them, as great loss is sometimes the consequence.

**THE RICKETS.**—This disease is something like the last, and nothing can be done except changing the breed of sheep. When they become rickety, it is the best plan to kill them.

**STIFF JOINTS.**—Sometimes lambs are affected with a stiffness in the joints about the middle of summer. It is caused by the impoverished state of the ewes, or change of temperature, in consequence of which they are stunted at the time they are disposed to grow; by which means their joints swell and become painful and stiff, but they generally recover.

COMPARATIVE MANURES.

The last report of the East Lothian Agricultural Society notices a comparative trial of different kinds of manure by Mr. John Brodie, Aimsfield-mains. Mr. B. had part of a field which had previously carried turnips, sown with wheat, Spring 1835, and manured as follows:—

1st, 10 cart loads of street manure, per Scots acre, at 5s 6d.....	£2 15 0
2d, ½ ton rape dust, at 110s.....	2 15 0
3d, 8 cart loads of farm-yard dung, at 7s .....	2 16 0

The produce was as under:—

1st, 6 quarters of wheat, weighing 60½lbs. per bushel and 345 stones (tron weight) of straw.	
2d, 6 ditto, 5½ bushels, weighing 69½lbs. per ditto, and 285 stones ditto.	
3d, 5 ditto, 7½ ditto, weighing 60½lbs. per ditto, and 266 stones ditto.	

Thus proving rape dust superior to street manure and farm-yard dung for raising wheat—a matter of great importance to farmers, especially to those in remote situations—a cart loaded with rape dust going so much farther than one with street manure. Here it may also be stated that Mr. B. had a comparative trial of different kinds of manure given to the turnips which preceded the wheat crop. The respective manures were applied in the following proportions per Scots acre:—

1st, 20 cart loads of street dung, at 5s 6d....	£5 10 0
2d, ½ ton rape dust at 110s.....	2 15 0
3 qrs bruised bones, at 19s....	2 17 0
	—5 12 0
3d, 16 cart loads of farm-yard dung, at 7s .....	5 12 0

Mr. B. remarks that “the whole turnips braided beautifully, and from the first, till the time of lifting, it was impossible to decide which would be the weightiest crop. I therefore determined, on the last week of November, to take up alternate rows of the whole, and weigh each separately after the roots and tops were taken off, and the result was found to be as follows:—

1st, ½ Scots acre manured with street dung .....	Cwt. 1b
produced of common globe turnip .....	301 92
2d, ditto, with rape and bone dust .....	304 99
3d, ditto, with farm-yard dung.....	312 30

## LETTER TO LORD JOHN RUSSELL ON THE TITHE QUESTION.

MY LORD,—I believe that both the government and the parliament are desirous of effecting a just arrangement between the tithe holders and tithe payers; but it appears to me that neither the subject of complaint nor the principles on which it ought to be removed, nor the difficulties that intervene, have been sufficiently considered or rightly understood. I shall attempt to set them forth briefly and distinctly, thinking that upon a subject of such importance the sentiments of any person who has long and dispassionately considered it, will not be unacceptable.

It cannot be controverted, that where one party complains of a grievance, it can have no claim to have a greater advantage conferred on it, to the detriment of the other party, than the removal of that grievance. What is the grievance arising from tithes to the owner of land? Not the existence of such a charge, for that is of such extreme antiquity, that not a single family in the kingdom can show that they possessed land before its existence. The land has been universally purchased subject to that charge, and the price given for it has been so much the less than would have been given for it otherwise. The purchaser of impropriated tithes has as sound a title as the purchaser of the land: the clergy have an indefeasible life interest, the more to be respected, because they are debarred from other professions if stripped of what they now enjoy. The fee simple of the church tithes is in the State, subject to the life interest of the incumbent; except in cases of private advowsons, where there is a concurrent title to the fee, which the State could not resume without indemnifying the patron for his interest. To remove, therefore, or diminish by a compulsory act, the charge upon land, would be to make a present to the landowner at the expense of the titheowner. Yet the landowner, has no just cause of complaint against its existence; and the occupier, where land is let, must know (if he is not deficient in intellect), that if that charge were removed, his rent would be increased to an equal amount. The just complaint is solely this, that if the occupier should be disposed to make an unusual outlay of capital in very deep drainage, or rearing a more expensive breed of live stock, or purchasing additional manures, he is taxed upon the produce of that extra expenditure, and that such a disposition to expensive agriculture did not exist in earlier times, and operates against improvements which would be beneficial to the country. It is the duty of the legislature to seek how to remove that evil with as little injury as possible to the titheowner, whether he be a lay-impropriator or a member of the clergy. It is, however, to be observed, firstly, that no retrospective deduction can be made on account of improvements; secondly, that if the tithe-payer is to be relieved from the tithe of the produce of an extra application of capital, on the other hand the tithe-holder ought to be defended from the defalcation consequent on unhusbandlike neglect and impoverishment of the land; and that the payment of tithe must be limited, if by compulsory arrangement, to the tenth of that which the land would produce, if properly treated in a plain husbandlike manner; that is, cleaning the land, ditches, and furrows, and laying the produce of the hay, straw, and green crops on the land. It is evident that if the occupier be allowed to apply

extraordinary means, without paying for increase of produce, he ought not to be allowed to pay less than the average, if he diminish the produce by waste and neglect.

This being the only just ground of complaint, and just basis for its removal, let us see what difficulties stand in the way of an arrangement.

Any skilful surveyor can say what ought to be the produce of any given soil (quality and situation considered) if farmed in due course, applying the hay, straw, and green crops, and keeping the land and watercourses clean, without having recourse to extraordinary expenses; and it is clear that, if the tithe be fixed permanently to that amount, the owners and occupiers of land can have no just cause of complaint, and that to give them more advantageous terms would be to enrich them by taking from others who have as just a title to their respective properties; and although parties, if left to arrangements amongst themselves, may make concessions, the legislature cannot, without injustice, compel an arrangement on any other basis. If the adjustment of the bargain be left to voluntary agreement, the same causes that have operated to reduce the annual payments in particular situations, will operate to reduce the final composition there also: but if a compulsory arrangement in unjust terms be held out, the party who would derive the unjust advantage will, of course, not accept of any other.

All that is necessary for effecting this is to enable the lay impropriator and the incumbent (with the consent of the patron and ordinary, to prevent fraud) to make a voluntary permanent arrangement with the landowner, fixing the annual value to be paid: and, where they cannot agree, to allow them to employ a sworn valuator, upon the principle above stated, the expense of the valuation being thrown upon the party demanding it, or rather on the State, as the improvement of the land (which is sought) is of national importance. But that arrangement and valuation must make a distinction for the future as well as the present between land when ploughed and when in grass—viz, that the tithe shall be so much when it is ploughed, and so much when laid down in permanent grass; and it must specify each field, or at least tract of land of like quality separately, or great cause of complaint will arise hereafter, if the land should be sold off and partitioned under an equal charge, though of unequal quality. That valuation being agreed upon between the parties, or determined by an impartial and sworn arbitrator, and the amount made a permanent rent-charge on the land, the owner and occupier will be relieved from all the real grievance of tithes. Any further complaint would be only an unjust clamour and a desire of appropriating another man's possessions. It would be just, however, where land is now deteriorated by neglect and waste to allow a deduction for three or four years while it is recovering, before it pays the average charge on land of such quality.

Let us now consider the injustice of, and the obstacles to, any other mode of proceeding.

In some parts of the kingdom the clergy have been in the habit of taking less than the value; in others, of receiving a fair remuneration: and it will be found that where they have received least, the tithe is most unpopular, because its unpopularity has been the cause of their taking less; and that, where they are fairly paid, there is little if any complaint. For instance, in a part of the kingdom where the agricultural population

are better satisfied than in any part of England, the tithes are generally let upon their calculated value. If a plan be adopted of forcing those who live in a part of the kingdom where the full value or thereabouts has been usually paid, to take less, the most cruel subversion of all the comforts of those persons must ensue, by stripping them of a portion of the income on which they had calculated for life; and a gift will be made of that which is taken from them to persons who have not been complaining, and have no reason to expect such a boon. On the other hand, the compulsory increase of the income of the clergy, wherever they may have been in the habit of taking very little, will occasion greater dissatisfaction to the grumblers, who will think they could have made a better voluntary arrangement. Here, therefore, would be a grievous curtailment of the income of many persons, to the total subversion of their domestic habits, without giving general satisfaction or any evident advantage to the nation. What justice is there in ruling that because at one extremity of the kingdom local circumstances may have induced the tithe owners to take less than their due, those who live at the other extremity, where such circumstances have not been in operation, shall be stripped of the income they have enjoyed without interruption or complaint? Such a proceeding strikes at the security of all property. It might with equal justice be decreed that because in one part of the kingdom landlords may have been contented with such a rate of rent, they shall not in another take a higher; that because land sells here for 24 years purchase, it shall not sell there for 33. And what is the fact? Does the land where low tithes are taken sell for more years purchase? Decidedly not; in such counties it sells for 24, and in Yorkshire, where the demand of full tithe is usually expected, it sells for 33, and even 36 years purchase.

If you lay the charge equally on a whole parish, or even a farm, which may contain many variations of soil, great cause of future complaint would arise on the dismemberment of the farms, and the charge must be unjust at first as regards a parish.

If you do not distinguish between the future charge on grass and arable land, great injustice will be done; because those whose land happens to be in grass will be charged little, and may immediately plough it up; those who have now arable land will be charged much, and will not be relieved if they find it necessary to lay it down hereafter; and hence, considerable injury would arise to the holder of soil which is from its nature expensive to till.

Large tracts of lands are under a modus for hay, and titheable when ploughed; other large tracts, which belonged to the privileged monasteries, are free when occupied by the owner, and titheable when let. By no arrangement can the tithe of these lands be settled, but by their paying when ploughed, or when let, as above proposed; and it is utterly impossible that the fee simple of the right of tithe on such lands should be valued, so as to sell it, and discharge them entirely; though the sum which they shall pay annually, whenever chargeable, may be easily fixed.

If an average of any number of late years be taken as the test of the value of the tithe, a bonus is given to the man whose land has been neglected and impoverished, and a heavier charge imposed on that which has been fertilized and well man-

aged, doing injustice to the landowner, which would be obviated by valuing the charge at the tenth of the average produce of the soil, when duly treated, without extraordinary expense, allowing a deduction during a few years, for the recovery of any land now impoverished.

Any attempt to regulate tithe by rent must be unjust—1st, because tithe bears no relation to rent; the produce and tithe of two fields being often the same, though the rent of one is high on account of the labour of tilling it being small, and of the other low, on account of the labour being great—2dly, because rent in some degree depends on the disposition of the landlord. A man seeking popularity for electioneering views may find it for his interest to lower his rents, but he has no right to drag down his neighbour's tithe also to promote his views.

No redemption of the rent charge by the landholder can be effected with justice; nor is it desirable. With respect to modus land, and land free in the occupation of the owner, it is impracticable; with no land can it be effected without an evident advantage to the present holder of grass land, to the disadvantage of him who holds arable. To the clergy it would be very hard; because if the capital be placed in the funds, they will have worse security; if laid out in land, which would be worse for them than the funds, they will be burdened with the cares of a property which they may be unable to let, and not have capital to cultivate, which may have been impoverished by the previous incumbent, and which is burdened with repairs. If at all to be redeemed, there is but one fair mode of proceeding; that the purchaser should pay that amount of Three per Cent. Consols which will on the day of the purchase yield the same income as the rent charge—the money to remain in the funds, till the incumbent patron and ordinary agree on some more eligible investment. The rent charge, or present right of tithe, is worth more years' purchase than land, because it is not burdened with repairs of buildings, and the rate at which land sells in its immediate vicinity could not be a fair price; but when land notoriously sells in one part of the kingdom at 24 years' purchase, and in another at 33 and 34, how can it be just that it should be redeemed at a fixed number of years' purchase throughout the kingdom? Take the case of a person having a tithe income of 400*l* a-year in a quarter of the kingdom where about the full value is usually paid; if reduced to 75 per cent. there remains to him but 300*l* a year. If that is redeemed at 25 years' purchase he will receive 7,500*l*. What is to be done with it? If placed in the Three per Cents, at 91, it will yield him 213*l* a year, in the place of his 400*l*. If laid out in land at the market price, in Yorkshire, which is 33 years' purchase, it will yield 227*l* a year, with a deduction of 10*l* per cent., at least, for repair of buildings, and, in truth, not much more than 200*l*; and, further, if the clergy be compelled to invest the money in land, the market will rise against such large investments. At all events the income of such a person will be cut down to about one-half what it is at present, whether he be a clergyman or a lay improprator. Take the further case of such a man having also an estate in a clay country, where, from the low price of corn and the greater expense of tillage, he is preparing to lay down a great part of it in grass; he will be forced to pay hereafter an undue burden on account of the land having been lately ploughed. Suppose him to have other farms, where the land is more

favourable, and good tenants, who have bought rape dust and malt dust to lay on abundantly; he will be charged there in perpetuity on account of the good crops lately raised by his tenants; and on all sides his income will be curtailed, both as a landowner and a titheowner.

Take the opposite case of a man having 400*l* a year tithe property, in a quarter where only half the real value is obtained, and land sells for 24 years' purchase. His tithe is to be raised 25 per cent. and becomes 500*l* a year; redeemed at 25 years' purchase, and laid out in land in his vicinity at 24 years' purchase, he remains with a rental of above 500*l* a year, subject to deductions for repairs. Suppose the same man to have an estate of grass land greatly impoverished by bad tenants and neglect, he will redeem the tithe thereof for a small fraction of what its value would have been if ploughed and properly treated, and may immediately plough it up and apply manure to it; and the income of such a person will be increased in the opposite scale, though there was nothing in the circumstances of his case that entitled him to any advantage at the expense of others.

Is it desirable to disturb the existing state of things to bring about a result so unjust? and is it not more desirable to adopt the plan above proposed, by which no flagrant injustice will be done, and yet the only real cause of complaint will be effectually removed—namely, the check on improvement and extraordinary application of capital?

There remains to consider, if the value be fixed as above proposed, how it should be paid. If you were certain of starting from the medium point, and that the market would fluctuate about equally up and down, a corn rent would be just; but the price of wheat is proved by experience to be a false criterion of the value of tithe, because in the last three years the price has been low, in consequence of the abundance of the crops; and the real value of the whole crop, and, consequently, of the tithe, has not been materially less on account of the low price. On the other hand, a great rise in the price, in consequence of a bad crop, would make a corn rent too high; and unless there be an equal fluctuation, one party or the other would suffer accordingly. It would, therefore, be probably best for both parties to fix half the value in money and half in kind; but no one kind of grain is a safe criterion. Wheat may be low; oats, barley, beans, and beef high: therefore the more articles are priced the fairer the payment will be. For instance, to represent a payment of 9*s* 4*d*, say (it matters not whether the prices here supposed are correct or not):—

Cash	s. d.
One-eighth of a week's agistment of a full sized	
beast, at 4 <i>s</i> .....	0 6
One pound of beef .....	0 5
A quarter of a pound of wool .....	0 6
A quarter of a stone of hay .....	0 6
One-eighth of a bushel of wheat at 5 <i>s</i> .....	0 7½
One-eighth barley at 4 <i>s</i> .....	0 6
One-eighth beans at 4 <i>s</i> .....	0 6
One quarter oats at 2 <i>s</i> 6 <i>d</i> .....	0 7½
One quarter a labourer's daily wages at 2 <i>s</i> 0 6	
	9 4

or such of the above items as it may be found convenient to include. The quantity of each article which the tithe of an acre or tract of land shall represent having been permanently settled, it will be only necessary to set every seven or fourteen

years the value of the articles, taking the grain at the average price of the county return for the last period of seven or fourteen years, and the price of the prime samples of the other articles, if included, which will be more easily ascertained than the average, may be set by a sworn arbitration in each parish, to the best of his judgment, and he might be named by the tithe payers and rector, if they can agree; and if they cannot, by the Secretary of State.

The only remaining difficulty would arise out of small tithes and vicarial tithes. Where there is a Vicar, the small tithes of all persons having land should be included in the consideration of the payment to be fixed, and the rector would willingly abandon the small tithes of cottagers without land. Where there is a Vicar, the arrangement should equally be made in gross with the rector and vicar; and if they cannot agree as to the amount to be secured out of the whole to the vicar, the sworn arbitrator must be called in to adjust a fixed payment for him.

The only other point that suggests itself is the necessity of saving existing leases. Where the tithe-owner has leased the tithes to the landowner for his life, or for a long term, the legislature cannot without injustice annul such agreements, in order to compel the parties to make a new agreement on a different basis; and, therefore, in such cases, though the permanent arrangement may be made immediately, it cannot be brought into operation before the termination of such leases (except by the consent of both parties) with any semblance of justice.

I earnestly entreat the government and the legislature to weigh maturely these considerations, and not by a hasty measure to produce grievances greater than what they are desirous of removing.

A LANDOWNER AND TITHEOWNER.

P.S. The case of hops should have been separately considered; as far as this cultivation depends on great application of expense, it calls for some relief; but if other parts of the farm are robbed to fructify the hopgarden, which is usually the case, it is a diversion of the manure from its proper course, which furnishes no ground of complaint. There seems to be no mode of dealing with the cultivation of the hops but the fixing a certain additional sum per acre for all land on which they shall be grown. B.

ISLINGTON MARKET.—It appears from an advertisement in the *Norwich Mercury*, that nearly 500 farmers of the county of Norfolk, whose names are given, headed by the Duke of Norfolk, Lord Lynedoch, Mr. Coke, General Fitzroy, Sir J. Astley, M.P., Sir W. Folkes, M.P., and E. Wodehouse, Esq., M.P., have determined to support the Islington Market, that journal says that it is but due to Mr. John Sayer of Sealthorpe, to whose continued exertions the proprietor of Islington market was previously so much indebted, to state that he has been indefatigable in obtaining the large list of supporters to which we have alluded. The tolls which will be levied, and which cannot according to the Act be increased, are, for beasts 2*d* each; for sheep 1*s* 2*d* per score, including pens; the whole of which charges are paid by the salesman out of his commission;—that the lairage is 3*d* per head on beasts, and 1*s* per score on sheep, per diem. On any day *not being a market day* they may occupy the lairs;—but in order to render every accommodation to Graziers sending stock to the Islington cattle market, Mr. Perkins has determined to charge only one night's lairage on cattle coming into his lairs on the Saturday, though they remain in the lairs till after the market is over on the Monday.

## THE TITHE BILL.

[We cannot subscribe to all the doctrines laid down in this letter, but coming from an individual who has attained so high an eminence in his profession as Mr. Preston has, it is entitled to great consideration, and besides does really contain some valuable information—EDITOR FARMER'S MAGAZINE.]

SIR,—Allow an individual whom the public have in more than one instance honoured with their approbation, to call your attention to the measure of tithe commutation now depending in the House of Commons of the United Kingdom.

On examining the provisions of the bill it is collected, that the burthen of the tithes will, in many districts, be doubled, and in other districts trebled. Even the clause for voluntary commutation is open to great objections to all those districts (like Norfolk and Suffolk, and the western counties) in which rent is almost universally the measure for estimating the value of tithes to be paid to the tithe-owner, especially the clergy.

This clause assumes that the full value of the produce is to be the foundation of the value of tithe; and the value, of course, includes in its estimate the increased and improved value by the outlay of capital, the employment of labour, the purchase of manure, however costly, and all other items which attach on the cultivation of the soil, and even on the poor-rate, and on seed; and it includes the value of produce, as in the price of beer and other articles of consumption it is augmented by taxation. In the result the cultivated lands of the lowest rate of rental value, whether the value depends on locality, nature of the soil, distance from manure or from market, will bear the highest rate of contribution towards tithes; for an amount of increased number of rents must be obtained by the farmer to enable him to carry on his cultivation and pay his outgoings; and this calculation will absorb all or a large proportion of rental value.

There is a gradation of rental varying between two rents and 10 rents. Produce equal to two rents, or even one-and-a-half with interest of capital, tithe, and poor-rates, would answer for good grass lands; three rents may be allowed, and an ample compensation for arable lands of the highest grade, say 4*l* per acre; four rents may suffice for medium lands. The produce must range at the rate of five rents, at least, for land under 13*s* 4*d* per acre. For lands under that rate, the produce must be from seven to 10 times the amount of rent.

In Norfolk, Suffolk, Surrey, and the west of England, it will be found that the owners have their tithes increased to a degree bordering on ruin.

If the enactment ended, as it ought in justice to do, with a power to make voluntary commutations, the legislature might be justified in passing the bill into a law; but the compulsory clause violates all the rules by which parliament has usually been governed in enacting laws affecting property, and making important changes in its value.

It is quite clear that, with a compulsory clause, you cannot expect a commutation on any other terms, at least after a short experience of the working operation of the act, than those prescribed by section 1; for if the incumbent would consent to commutation on more just terms, he could not bind the patron or ordinary, or, as a consequence, his own successor, without the concurrence of his

patron and ordinary. The latter, in justice to the Church Establishment, and the former, in justice to himself, his family, and frequently his creditors, would not give his consent, except on the advantageous terms prescribed by the legislature; and then the commutation must be founded on the value of produce, without the least regard to the amount of rental value; and the amount of rent must in all cases depend on circumstances, and will not admit of any uniform standard.

Did the clergy, as a body, ever receive or expect to receive for their tithes a portion of the rental value, approaching even to one-third part of the amount? and would the value of the tithes of this kingdom have been increased as they have been within the last sixty years, had such a claim for tithes *to tithes* been generally enforced? True it is, the tithe-owner has, by established law, a right to one-tenth part of the gross produce; but, though such be the right, it has been well understood that its enforcement would never have been tolerated. And have not the tithe-owners uniformly benefited by the increase which has taken place in the last 60 years in the productive powers of the soil, from artificial improvements and an improved system of husbandry? Has not every increase of rental value given to the tithe-owner a corresponding increase in the value of the tithes? Have not improvements uniformly raised the value of tithes while the owner or cultivator has not derived more than a reasonable rate of interest on his capital, withdrawing the capital itself only by slow progressive means through a long term of years?

The clamour which has been raised, often unfairly, against tithes, has been urged on the ground of the injustice that the tithe-owner should receive a large portion of the produce of the farmers, including income from improvements arising from capital in money, and the labour, skill, and industry of the owners and occupiers of the soil.

The principle of the depending bill is to arrest the progress of the evil by excluding all such participation on the future increase.

If it be expedient to avert future evil, is it not equal justice not to fix and perpetuate the right, even in districts in which it has not already been exercised, of taking this undue and unjust advantage of useful and praiseworthy application of one-half (and in former times it was four-fifths) of the best employed capital of the kingdom; a capital with its progressive increase skill and science is employing in cultivation of the soil and in diffusing all the comforts of domestic life to the hardy labourer and his family?

Not only is the extreme right to tithes to be tolerated, but it is virtually and in effect, from the increased facility of obtaining the knowledge of the actual value, and the security of obtaining that amount, enjoyed, and in effect, though not in terms, it is morally enforced. Correctly, then, is this bill styled, "The Tithe-owner's Bill!" Instead of being a bill of relief to the landed and agricultural interests, it is an infliction of the most severe injury to a large portion of them.

The number of resident landowners is, in nine cases out of ten, very small. In future, as existing leases shall terminate, the tithe-owner will be removed from all conflict with the occupiers of the soil, except for the purpose of demanding surplice fees, &c., and taking distresses, and making entries to enforce the payment of tithes. Thus the person now liable to tithes is to be exonerated, and the landowner, against whom or whose property no direct remedy now exists at law, or in equity, in his character of landlord, is to have the annual

value of the tithes fixed on his property, and as the first charge after the land-tax.

Thus he is charged with one-fifth of his income by one parliament, now greatly reduced by the increase of rent, and by another parliament is to be fined with a direct charge of at least six-tenths of the amount of the actual value of the produce for tithes. Was any other property ever so grievously charged, and permanently, too, with taxes? The income-tax, or, as disguised by the denomination of property-tax, does, in comparison, sink into insignificance. This proposed taxation is more grievous, from the circumstance that, by reducing the annual rental, it reduces the saleable value of the fee-simple in a serious degree; and while the fee-simple value of lands will of necessity go down, the value of rectories and the patronage of advowsons will receive an extraordinary advance—an advance arising from the certainty of the security, and its liability to a decrease only from a variable money price for corn, and the facility of collecting the income from the comparatively few individuals, instead of a numerous and frequently a distressed class of persons. The landlord is not liable, and will not be liable, unless a law should be passed obliging him to take this responsibility on himself. He frequently loses his rent; and hereafter this loss may include the amount of an increased rent for the value of the tithes. If the landlords will take the responsibility on themselves, it should on all principles of justice be an equitable compensation. The 40 per cent., to be withdrawn from the amount of the value of the tithes, leaves to the tithe-owners the net rental value of tithes, after an allowance for the average rate of the expense and risk of collection, &c.

It is said, parliament, in passing inclosure bills, is in the practice of giving the tithe-owner one-fifth of arable lands and another of smaller proportion of grass lands:—*e. g.* one-seventh of mowing lands, and one-ninth of pasture and waste lands. The answer is, an allotment of one-fifth of open waste, or uncultivated lands is not to be compared in value or eligibility with a rent-charge on lands of ample value for its security, and with certain remedy for arrears, charges, and costs. There is not any danger of loss from tenants or depreciation, or neglect of the land; from the allotment of one-fifth must also be deducted all the usual expenses which are incident to the ownership of landed property.

Under the compulsory clause, the tithe-owner may avail himself of the present moment of high cultivation and increased produce, arising partly from the necessity (and that necessity never more imperiously existed) of increased energy and the application of increased industry and capital, when it may be commanded, to render an increase of produce equivalent in some degree for prices allowed to be ruinously low. Men of activity, with money of their own at their command, or supplied by their friends or landlords, are weathering the long-continued storm in which so large a number of cultivators differently circumstanced have been swamped. Is the landlord to be now taxed in perpetuity, by a rent-charge, for this energetic conduct of the occupiers—and in many instances a conduct to which the owner has not been a party? There are other cases, and not a few in number, in which the necessities of the farmer; the nature of his tenancy, as drawing to an end; his precarious interest, as a tenancy for life, or in many districts still continuing a tenancy of lives, as copyholds for lives, leases for

lives under ecclesiastical persons, and leases for years determinable on lives, at small rents, as in the western counties; their interests have always induced them, when their interests are drawing to a close, to force the productive powers of the soil down to as low a degree as any profit may be reaped, thus greatly deteriorating the annual value of the property. It is the con acre system, in effect, so much deprecated in Ireland.

The landowner has not any means of protecting himself from the injury thus inflicted on the soil, and on the termination of the lease he must reduce the rent to the tenant, who is to enter on an impoverished farm; and this owner will be charged in perpetuity for the produce of the titheable matters thus injuriously forced from the soil. Instances of this nature are familiar to all the landed proprietors of the western counties.

There is another and still greater evil enforced by the compulsory clause. Proprietors who have been cultivating and improving the soil by a judicious rotation of crops, merely for the purposes of restoring the land to grass, as its more useful and profitable destination, are by this clause subjected to have the produce of lands valued while in cultivation, and the rate of tithe will be totally inapplicable to them when restored to grass. Thus the tithe rate will be doubled, and in many cases trebled, through all time, on the fee-simple value. The writer of these observations will suffer a loss in the fee-simple value to an extent which may, and probably will, exceed one-fourth part of the present value. A provision to suspend the compulsory clause for seven years is the only relief for cases of this description; and it is a just relief, because it is as much the right of the proprietor to apply his land to the purpose of affording the greatest possible net rent to him, as it is the right of the tithe-owner to exact tithes in kind. It is to this right of the owner of the soil, and the acknowledged comparative profit of grass over arable land, and the fitness of the soil for grass rather than corn, with the difficulty to farmers of small capital to cultivate corn crops, which demand a large supply of lime, or sand, or other manure to be brought from a distance, while the corn crops must be marketed at a great distance, that the low rate of the tithes in the western counties is, in some and a great degree, to be attributed. It is also in some, and in no small degree, to be ascribed to the kind and honourable feelings of the clergy, who, in general, are farmers for domestic purposes, as a means of maintaining a more suitable hospitality on incomes comparatively small, and who well know the difficulty with which moderate rents, with the tithes, taxes, poor-rates, and other out-goings are raised by farmers, who for the most part commence with very small capitals, and rank for industry, and, in numerous instances, for intelligence and good qualities, with the most respectable occupiers of the land with large capitals. They are farmers who were labourers or bailiffs, and who personally, and with their wives and children, male and female, and poor children bound on them by the parish, perform, with the mutual interchange of labour with their neighbours, nearly all their work without paying any wages. Will you oppress them, by taxing them with the value of the produce of their titheable articles—in particular of their potatoes—the great and staple article of their culture? To withdraw 40 bushels of potatoes as the tenth part of the farmer's and cottager's produce of this article (and the average produce is 400 bushels), would be to cause an uni-

versal outcry and declamation, not to use the harsh phrase of curses, against the tithe-owner. Dissenters from the Church would increase; and if you shifted the burthen from the occupier, and made the charge in perpetuity on the owner of the soil, and he was a Dissenter, what would be his feelings? Potatoes are frequently raised on lands of very low annual value, say 10s. per acre; the tithes would be 40 bushels of potatoes; and a single crop gives in one year's value about one-seventh part of the fee-simple value of the land. Is this a measure to be enforced by the enactment of a British legislature? Some lands have been in potatoes for many successive years. Take seven years, and the value of the entire fee-simple is absorbed. Will not this be the immediate and direct application of the law to the lands which have been appropriated to the cottage or allotment system?

In still greater degree the infliction would fasten on the lands employed in raising costly crops, *e. g.*, hop-yards, market-gardens, teazles, wood?

You may say, they shall be protected. The protection is not because the tithe-owner has not a right to tithes in kind; his right is as complete and perfect as it is to the tenth part of potatoes, or of crops of corn, when raised by extraordinary outlay of capital in lime, sand, oat-cake, bones, or other expensive manures, without which there would only be a crop of 10 or 15 bushels, instead of 24, 30, or even 40 bushels. The natural produce being 10 or 15, the tenth of this produce ought in justice to satisfy the tithe owner. Is there any justice in his demanding two or three bushels, or double or treble tithe, because the cultivator has been a highly useful and energetic member of society, instead of being a drone or a sluggard, or wrapping his talent in a napkin? Could Parliament so deal with machinery, and tax the employment of capital, would your imports and use of cotton have increased as they have done between the year 1792 and the present period? being nearly the identical period during which British husbandry has, under a system patronised and encouraged by a patriot King, and fostered by a British Legislature, even more than trebled the produce of the soil, and, in the result, the rental value of land, and the corresponding increase of the value of the tithes. A compulsory power of enforcing a valuation of property at a period when it is in a state of management in which it could not, with prudence, have been, if a measure of value founded on that state of the property could have been anticipated, is unjust in the highest degree; and though Parliament has the undoubted power, it has not a constitutional right, to change the state and value of ownership, by substituting a fixed perpetual charge on land, in the place of a variable uncertain burthen, not directly affecting the land.

This is more especially true as applied to property so circumstanced that no general rule or standard can be correct or just, as applied to lands of different qualities, differently managed, in a different mode of occupation, and of which the proper and judicious management depends on circumstances, which frequently vary, and are peculiar to each district, and often to each individual occupier.

The case of the market gardener, as applying to a single acre, exhibits the enormity of the system of tithes taken in kind.

Ten pounds of rent, with 40*l.* of capital, produce five times the amount of capital, *i. e.* 200*l.* The

farmer who cultivates potatoes for his cattle, either in aid of turnips, or as a substitute for them—and in many cases they are a useful and almost necessary substitute—will use 10 acres, worth 20s. an acre, or less, but say 10*l.* of rent. His capital employed must be 8*l.* an acre. His produce may be estimated at 200*l.*, viz. 400 bushels an acre, at 1s. per bushel; though, in truth, this is more than 50*l.* per cent. beyond the usual value to the farmer; while to the person who withdraws the tithes from the farm for sale, they are on the average of years worth that rate; so that the farmer pays on this article equally, and indeed more, out of his capital than the market gardener.

On an accurate estimate of Norfolk farms of the rent of 1*l.* per acre, the produce in value of four acres in wheat, barley, turnips, and clover, will be 20*l.*, or 5*l.* per acre. The tithes are one-fifth of rent, or 4s. in the pound. On the value of produce they will be increased to 6*l.* per acre, *i. e.* 50 per cent., after deducting the allowance of four-tenth parts, or 40*l.* out of each 100*l.* On the farms of that venerable and venerated agriculturist, Mr. Coke, the tithes will, in consequence of liberal expenditure on lands of inferior quality, be full two-third parts of the rent.

Mr. Mills' statement of 42 farms, p. 24 of "Simple Equation of Tithes," published by Hatchard in 1817, gives an average produce of 763*l.* for each average farm of 161*l.* rent, and the fluctuation of averages may be accounted for by the larger or smaller proportion of grass on each farm. This is a curious and interesting document. It was taken from a return to the Board of Agriculture.

For the honour of the clergy (and the opportunity of collecting the sentiments of many has occurred,) they never expected more than a reasonable part of the rental value of the land. Of late they were apprehensive of spoliation of the Church, or reduction of their income. It never entered into their imagination, that in three cases out of four their income should be very materially increased, still less that they should be relieved from the approach of the sturdy occupier, and their difficult and costly remedies; and have the great and high privilege—and it is a new privilege—of a right against the owners of the soil with the right of distress and preference in enforcing his income. The compulsory clause also has the vice, that it will discourage voluntary arrangements founded on former compositions. The still greater vice of the measure is, that it takes the value of actual produce, and not of annual rental, as the basis of commutation.

Let the actual increase of income be to the tithe-owner in the same rate as to the landowner, and neither party would be injured, and both parties would be, at least ought to be, satisfied.

Let rental value be the criterion, graduated by different rates on, 1st, arable lands; 2d, grass lands; 3d, mowing lands; 4th, up and down, or convertible lands (*i. e.* sometimes in crop, but generally in grass); and lastly, waste-lands; and the greater part of the difficulties would vanish.

That rental is the just criterion, no one can doubt. Its justice is proved by experience. Let a parliamentary inquiry be instituted into the mode of dealing with tithes for different periods of 20 years from the year 1700, when, judging from the land-tax, the rental value of the kingdom was only 5,000,000*l.* a-year; or only from the establishment of the sinking fund, when it did not exceed 20,000,000*l.* a-year; and it will be found

that the system of taking tithes in kind, or even a composition founded on the actual value of crops, constitutes the exception, and not the rule, by which the tithe-owner—frequently too a lessee, or a sequestrator, for the benefit of a creditor or a body of creditors—has been governed.

The bill protects the clergy, by imposing the necessity of the concurrence of the incumbent, the patron, and the ordinary, to a perpetual commutation. It places a check on the clergy by providing that the rate of commutation shall be 60 per cent. on the value of produce, in case the composition has been of lower amount. It also provides that if the composition has exceeded 75 per cent. on the value of produce, it shall be reduced to that amount. Thus, between two classes, there is, without any reason, a difference of a quarter in favour of the rapacious tithe-owner over the mild, meek, charitable Divine, who has been content even with his 3s in the pound on the fair annual rental value of the land. Denying the constitutional right of parliament, consistently with established principle, to carry this bill into a law, against the will of the landed interest, there is flagrant injustice in making this distinction. Either one class is to have more, or the other class is to have less, than is a reasonable equivalent. What rule in ethics, or in politics, can support the distinction proposed to be made? It is at least an invidious one.

This very difference would of itself create a just reproach against British legislation.

It is a proof that the framers and supporters of the bill dare not, by positive enactment, make one general and universal rule for all cases, although all cases are equally open to one rule; say, if you please, the class of 75 per cent. ought not to be reduced to a lower scale, because a higher scale has been paid to them. The same principle would apply to persons who, and whose predecessors in ownership, live in districts in which the rate of tithes has been governed by rental value, and not by value of actual produce; proprietors of this, by far the larger, class will be involved, most unexpectedly, in immense loss, and many in ruin, more especially should parliament take from them, as the bill proposes to do (by the clause under which the tithe-owner may, at an early period, require a valuation,) their acknowledged and indisputable right, by a judicious and proper, as distinguished from a vindictive, management of the property, &c., by planting, or other similar means, to relieve themselves from the ruin which, in instances to the amount of many millions, infallibly awaits them.

These observations are dictated by a sense of duty; a duty to the public, flowing at the same time from a personal interest, with a very large experience on the subject.

The case of the writer is one of very peculiar hardship. Over a large tract of country his outlay of capital has already increased his actual payment for tithes in a very high degree; and the bill if carried into a law, would tax him in a still higher degree, by an assessment founded on the value of produce or crops which never would have existed could he have foreseen that the value of produce, and not rental value, would be enforced by law, without having any right of changing a mode of husbandry which, in the result, will be highly injurious, to a mode which would be profitable, and would be consistent with the law as it had existed from the first establishment of tithes, and the views and plans formed at the time of outlay.

The pressure of the bill, when a law, will be felt more severely on small farms, and on lands occupied for convenience, than on farms of an extent to be properly termed agricultural. In proportion as the farm diminishes in extent, the capital, in particular capital in the labour of the occupier and of his family, increases.

It may be assumed that the number of farms of different classes in acreable extent, as constituted of acres by 1000, 500, 300, 200, 100, 50, 30, 20, 10, give a proportion in each class, by a multiple, in favour of the farms as they graduate in the declining scale.

The like scale of gradation is to be found among the fund proprietors and the owners of realised capital in land. For one farm of 1000 acres or upwards, there are 100 under 100 acres; and in each gradation the increase in number is in favour of the smaller farms. It is a curious fact, that the number of fund proprietors and of freeholders is nearly equal.

It is notorious that as farms diminish in extent of number of acres, the acreable capital, and consequently the rateable value of produce, increases; for example, a small farm of 10 acres employs the labour of the occupier and of several members of his family: and the employment of their labour constitutes a most important and valuable substitute for capital in money. 3*l.*, 4*l.*, or 5*l.* in the value of labour abundantly compensates for capital applied on a larger farm in hiring labour.

The produce uniformly corresponds with the application of labour and manure, which are the great sinews of agriculture. Such small farms and their owners will suffer in an eminent and peculiar degree, in consequence of the increased value of produce from such extraordinary labour &c.

Does the legislature mean to affix a punishment on the individuals who, from patriotism or kindness of feeling, or even attention to their own interest, have formed and encouraged farms of this description, so useful to the community and the state?

The proposed measure will annihilate all the rental value of these cottage farms, and of lands appropriated to the allotment system.

The origin of tithes, or their original distribution, is a subject which the writer does not wish to discuss; but unquestionably if the tithe-owners insist on their right, as secured to them by strict law, parliament, and through parliament, the public has a right to inquire into the origin and original distribution of tithes, and administer justice to all parties. The clergy must be aware that their enemies are at their post, and that many are anxious to see the Church of England in a condition with the Church of Ireland; and with the great difficulty, if not impossibility, of collecting tithes from the occupiers, even at the point of the bayonet, or with the aid of the military. Every honest man and every good clergyman will be cautious how he gives encouragement to this spirit. How truly happy would the clergy of Ireland be, could they be placed on the same footing as would be readily conceded to the clergy of England—a strong argument for commutation, without more than reasonable delay; and it is the honest opinion of the writer of these observations, that the clergy are as anxious as the laity for a just commutation of tithes on terms such as would meet most cordially the views of the writer. And in every arrangement the difficulties in which the

landed proprietors of England are placed by the advantages, in respect of tithes, existing in Scotland, and of tithes as enacted, and likely to be further enacted, for Ireland, must be weighed, each country being now, by steam power, possessed of equal advantages with the English farmer in his own domestic market; and, in justice, the final arrangement of tithes for England and Ireland ought to be concurrent.

To conclude, the sum of these observations is—  
1st. A commutation of tithes on just principles is most desirable for all parties, and will be useful to the state, as promoting peace and harmony between the clergy and their parishioners.

2nd. A direct charge on land, with summary remedies, may be conceded as a fair equivalent for commutation, and with a variation governed by the price of corn.

3rd. Voluntary arrangement, and not compulsion, ought to be the principle of commutation.

4th. The terms of commutation must in general be governed by a proportion of rentable value, and not by 6-10th parts or 3-4th parts of the full value of the produce of the soil; since an estimate by such produce is unusual, and in the far larger proportion of the country would be unsatisfactory, and frequently ruinous and destructive.

RICHARD PRESTON.

FROM THE LAST EDINBURGH REVIEW.—“We showed in article 6 of No. 120, that in the opinion of men of the highest respectability and intimately acquainted with the state of agriculture, that the raw produce of England might be well nigh *doubled* without greater proportion of expence, and whoever has observed the Lothians, and other well farmed districts, and compared them with extensive tracts in the south west of England and Wales, will be satisfied this is not exaggerated. It is indeed remarkable how very backward some parts of this island are compared with others. In many, four or five horses and two men are still employed to do that which is far better done in others by two horses and one man, and in many parts drill husbandry can hardly be said to be introduced. This shows that we are possessed of vast capacities not yet brought into activity, and that the career of improvement may be continued for an almost indefinite period.”

A suggestion by eminent practical men, submitted to the consideration of Members of Parliament.

“From a general knowledge of England and Wales I have not the slightest doubt that their produce might be *DOUBLED* by the Scotch system of agriculture, which is here in course of trial on at least a million of acres, and although it would lower the price both of grain and butchers' meat, farmers would *GAIN* more by quantity than they could lose by the fall of price.”

(Signed) WM. BLACKER.

Armagh, February 15th, 1836.

Author of the prize essay on the management of landed property in Ireland, and Steward to the Earl of Gosford, Colonel Close, &c. whose tenants he enabled to pay off their arrears of rent.—(See the 27th number of the Scotch Quarterly Journal of Agriculture.)

And official inquiry confirmed the great advance made in agriculture owing to the ENLIGHTENED AND SYSTEMATIC exertions of Mr. Blacker, under the FOSTERING CARE of his employers.

Signed by order of the Poor Law Commissioners.

HAMBLETON DOWDELL, Secretary.

Dublin, September 1st, 1835.

## TITHE COMMUTATION.

The following resolutions were adopted at a meeting of the general committee of the Central Agricultural Society, held on the 18th of March, at the Crown and Anchor Tavern, Strand, London,  
RICHARD SPOONER, Esq., in the chair:—

1. That tithes are an uncertain and contingent profit, depending upon the capital and industry, and even upon the will of the occupier, in as much as he may keep the land in a highly productive state, or may so use it as to make it produce no matters liable to tithes, or may leave it wholly waste and uncultivated, and that tithes are not a charge or *lien* upon the land, but a mere *personal* demand upon the occupier.

2. That nevertheless the principle of the bill, which is to establish a perpetual commutation, founded upon the average value of the tithes payable for seven years past, very erroneously and unwarrantably assumes, that the owners are forever bound to make the land yield, for the benefit of the tithe-holder, the same quantity of titheable produce which it has yielded to the occupier for the last seven years, and converts a temporary and contingent profit, resulting from the capital and skill of the cultivation of the land, into a perpetual charge upon the land itself.

3. That although the conversion of a tax upon the capital of the occupier into a tax upon the land itself, and the consequent transfer of the burden of tithes from the occupier to the owner, seem necessarily to imply, that a reasonable proportion of the net annual value of the land to be let, would be the fair and just principle for a commutation of tithes; yet the bill, nevertheless, charges upon the landowner, for ever, the value of the tenth of the gross produce of the land for seven years past.

4. That this committee is of opinion, that any change of the nature of a title to tithes by fixing them as rent-charge upon the land itself, without any consideration for the incalculable advantage to be derived by the tithe-holder from the exchange of an uncertain and precarious income, depending on *personal* security, for a certain income, founded on the best and most eligible of all *real* securities, would be a violation of the rights of private property in land, unexampled in the history of legislation.

5. That the imposition of a perpetual rent-charge, to be estimated by the former production of the land, will be attended with the most ruinous consequences to the landowners, and especially in those numerous cases in which, owing to the depressed state of agriculture, highly cultivated lands have been, and must shortly be, thrown out of cultivation, or deteriorated in culture and value; but the bill makes no provision for the change of culture in any lands, except the very remarkable and unaccountable proviso in favour of hop-grounds, which may cease to be cultivated as hop-grounds; although gardens, orchards, and all other cultivated lands, are equally entitled to the benefit of a similar proviso.

6. That it appears to this committee, that the per centage deductions professed to be allowed by the bill in *cases of compositions*, subject to the power given to the tithe-holder to demand a valuation of the tithes in kind, without any deduction for the expenses of collection, or otherwise, are nominal and illusory; the produce of such lands having been in most instances, very greatly increased, and in many cases wholly *created* by capital expended upon the faith of an actual exemption from tithes, by means of such compositions.

7. That this committee is of opinion, that it is contrary to the principle of equal justice to give the landlord's remedy by distress and entry to the tithe-holder, and to leave to the landlord the tithe-holders' mere personal remedy against the lessee or tenant of the land; and that the power of distress and entry, so given to the tithe-holders, will materially interfere with the landlord's remedy for recovery of rent, and his right of property and sole dominion over the land; and that such conversion of land-owners into tithe-holders, will be peculiarly oppressive to those religious communities and persons, who, as in the case of Quakers, are prevented by religious and conscientious scruples from becoming the holders of tithes.

8. That the bill, contrary to all legislative precedents, contains no provision for the protection of exemptions from tithes; from which it may be reasonably inferred, that it is intended to destroy, or subject to a severe and partial inquisition, all moduses and discharges from tithes throughout the kingdom.

9. That the following, amongst other provisions of the bill, appears to this committee to be highly objectionable, viz., the appointment of tithe commissioners and valuers, in the choosing of whom the land-owners have no voice, and who may be possessed of no local knowledge, the power given to the tithe-holder to force a commutation upon the land-owner; the clause which enables the owner of three-fourths of the land, (who is himself frequently the holder of the tithes,) to make an agreement to bind the remaining land-owners; and the half-yearly payment of a rent-charge for tithes (which are only payable annually), without any deduction on account of such half-yearly payment.

10. That the committee, after the fullest consideration, is decidedly of opinion, that a compulsory commutation of tithes, based on any other principles than are contained in the foregoing resolutions, will be most injurious to the owners and occupiers of land.

11. That very great encroachments have been made in modern times upon the rights of tithe-payers, by overturning moduses and exceptions from tithes which had been enjoyed for many generations.

12. That a just and equitable revision of the law of tithes ought to precede or accompany any legislative enactment for the commutation of tithes.

13. That the bill lately brought into Parliament by the noble lord, the Secretary of State for the Home Department, for the commutation of tithes, is vicious in principle, inadequate in its provisions for the object which it professes to contemplate, and would, if carried into a law, be productive of serious injury to the best interest of the country.

14. That the above resolutions be printed and circulated amongst the members of this Society, and the Local Agricultural Associations which have subscribed to the funds of this Society.

**A DOG CHURNING MILK.**—There has been in operation for some time past on the farm of Auchyle, parish of Port, Perthshire, occupied by Mr. Peter Ferguson, an ordinary sized staff or plunge churn making the butter from 16 or 18 cows—the propelling power of which is a colley dog. The machinery necessary for the process is exceedingly simple and cheap, and as a proof of the feasibility of the plan, which must prove a considerable saving to the dairy farmers, several of Mr. Ferguson's neighbours are about to enlist into their service the same kind of animal power.

## TITHE COMMUTATION BILL.

MR. EDITOR.—I trouble you with the following observations, because I should be sorry, on private as well as public grounds, that the tithe commutation bill should be rejected, through its containing the very decidedly objectionable principle so well remarked on by you this morning.

I never could conceive why the framers of the measure departed so widely from the principle of the tithing system, as to make tithes a fixed charge on land. By the principle of the tithing system I mean, that the tithe-owner thereby takes the chance of receiving nothing, if nothing is produced, as well as of receiving more if more is produced.

Now I conceive it would be best to adhere to this principle in any new system. This would be done by making tithe a variable proportion of rent, thus altering the particular chances, but not abolishing the abstract risk of gain or loss. Under the new bill, it would be very easy to declare that the tithes, as by that bill to be ascertained, shall for ever after be the same proportions of their corresponding rents that they are now; the corresponding rents to be ascertained, either by the present actual rents, or by means similar to those to be enacted for ascertaining tithes.

The alterations hereby made in the tithe-owners' chances of gain or loss, will be best seen by attending to the following formula:—

Produce—expenditure—rent where expenditure includes profit.

Now if tithes be made to vary as rent, when produce decreases, but expenditure decreases still more, tithes will gain instead of losing as they must if tithes vary as produce. If produce increases, but expenditure does not increase so much, tithes will gain more than they would when increasing only with produce.

Here, then, is a decidedly beneficial change for the tithe-owner, and no burden or obstruction to the landowner or occupier.

Again, if produce diminishes and expenditure does not diminish so fast, tithes will lose under the new system faster than it would under the old. The chances, however, against the practical possibility in this case are immense, but it would be trespassing on your space to state them. If, however, you wish it, I will do so.

If expenditure increases without produce increasing so fast, tithes would again lose faster than at present. The chances against the happening of this case are likewise great. The principal chance against it seems to consist in this: that the same cause which leads to an increase of outlay, without a corresponding increase of produce, tends to diminish profits and to increase rents. In other words, the part of expenditure which increases is made up by that part—profit—which diminishes. In neither of these latter cases then, is there any burden upon agriculture, while the titheowner's chances of loss are likewise compensated by an improved method of collection.

I am, Sir, your obedient servant,

Monday. W. P. GASKELL.

Grass Parks are letting considerably higher this year than last—Loudoun, Lanfine, Rowallan, and Hapland, were all lately let at a considerable advance, most of them as high as 8s and 10s an acre above last year's prices.—*Kilmarnock Journal*.—(We believe the same may be stated as to this county so far as letting has yet taken place. The advance is partly attributed to the increased trade in fattening live stock for the London market, which has been hitherto a remunerating one.—*Perth Courier*.)

## OBSERVATIONS MADE BY J. II. HERPIN, D. M. P.

ON THE PRODUCTION OF A VIRULENT ULCER  
IN MAN THROUGH CONTACT WITH DIS-  
EASED SPLEENS OF SHEEP.

TRANSLATED EXPRESSLY FOR THE FARMER'S  
MAGAZINE.

*From the Annals of French Agriculture, for Jan, 1836.*

About the 16th October 1834, when the epidemic which had been ravaging our flocks seemed to lose some degree of its violence, I observed upon the back of my shepherd's left hand, a small red tumour, the summit of which was about the size of a pin's head, and black as charcoal. The man had just been engaged in opening a sheep of which the spleen appeared completely disorganized.

I questioned him respecting it, and he answered that he had torn his hand slightly against the hoops of the tub in which the corn for the fowls was kept; but he added, that it did not appear disposed to heal readily; it had been done about three days.

The idea struck me immediately that this was a genuine ulcer. However as I had not seen the ulceration from the first, as no animal on my farm had been so affected, and as the man explained the origin of it so plausibly, I desisted from my interrogations, being unwilling to cause uneasiness which might be utterly groundless; but I resolved to watch the progress of the disease most carefully. I advised him to wash the part with some vinegar and water as the animal he had been opening smelt badly.

The next morning the black spot had increased but the man did not complain much; however, on the following day, he came to me for some linen to cover it.

At this time the black speck had increased to the size of a 50 c. piece, and was surrounded by an inflamed, red, shining circle upon which appeared several vesicles, true phlyctenæ, about as large as grains of corn; from the centre of the spot issued a bloody serosity; the hand and forearm were much swelled, and the disease presented every appearance of a virulent ulcer.

I applied compresses saturated with vinegar and laudanum to the part; and advised the man to go to a skilful surgeon in the neighbourhood immediately, who would do what was requisite. The applications allaying the pain, the man thinking himself better did not proceed to the surgeon; but on the following night he was attacked with nausea and vomitings; the spot having attained the size of a crown piece; the interior was of a pale black colour; phlyctenæ as large as walnuts covered the back of the hand; the arm was swelled as high as the elbow; and the man's spirits were very low and anxious.

I sent him immediately to the surgeon, who recognizing the character of the disease, at once excised the gangrenous parts, and cauterised the wound with nitrate of mercury.

Gangrene had spread so fearfully that after the sloughing, the extensor tendons of the fingers lay bare; and for several days I was very uneasy as to the termination of the malady.

However, through good treatment, Charles recovered his strength and resumed his occupations; the wound had a healthy appearance, and was nearly closed when I left the country on Dec. 30, 1834.

This man was of a sound, robust constitution, sanguine temperament, and about thirty years of age.

## ON THE CAUSE AND REMEDY OF CURL IN POTATOES.

By MR. JOHN RANKINE, GARDENER, KILSYTH.

*(From the Report of Drummond's Agricultural Museum)*

Having cultivated the potato in garden ground for a long period of years, during which I have had the mortification of witnessing one generation after another of my very best varieties literally curled out, necessity, which generally proves the mother of invention, urged me to endeavour, by all means, to find out the cause, and, if possible, the remedy of an evil of such magnitude. The question that most naturally presented itself arose from the fact, that the potatoes of the garden are more subject to the curl than those of the field, and those of fields most under the plough than those of fields that were least under it. After examining and experimenting in a great variety of ways, I came to the conclusion that the cause of the disease, for disease it is, must be the over-working of the land. When land is too short rested or pastured, lying in lea only one, two, or at most three years, its heart becomes broken, and unable to perform its proper functions—the soil does not possess stamina or strength sufficient to nourish and bring forward the tuber, so as to fit it for producing healthy shoots when planted out next season. Light soils are more apt to go wrong in this respect than those that are heavier and retentive. Lands would require to be rested from six to eight years, in order to recover or retain their healthy and vigorous constitution. In a garden which is constantly wrought, potatoes will not preserve their healthy state above a year or two.

The remedy is, when cultivators cannot, or will not, pasture their land a sufficient length of time, they should obtain their seed potatoes from districts where soil is not so much wrought, such as muirish, high lying, retentive tracks; the encouragement there not being so great as in the lower and more fertile, to tear and exhaust the necessary quality in the soil. I have always found seed to turn out well, brought from such places where they had not been planted above once in six, or perhaps eight or ten years. Another remedy is to select from any field that had been well rested, the healthiest and most vigorous shaws, marking them while green; avoiding all those that seem at all inclined to curl, for their progeny will generally be found more confirmed in it; and when ripe let them be carefully pitted and preserved till the time of planting. In cutting these for seed take only the top set or eye, which is always the last that will curl, the eye next the root being the first that incurs the disease.

Successful practice, consequent on, and confirmatory of the views thus shortly stated, will, I trust, be deemed sufficient apology for my offering them to the notice of others. J. R.

A SECOND MILLO.—The following is an advertisement in a Hobart-town paper:—"Found on a suspicious person two remarkably fine working bullocks."—*Athenæum*.

## TO THE MARQUIS OF CHANDOS.

MY LORD,—As the great champion of the agriculturist, I address myself to you on a subject of what I conceive to be of the greatest consequence to the British farmer, and that is, that he may be fairly remunerated for his capital and industry in common with the rest of his Majesty's subjects. A great deal was said at the passing of the present Corn Bill, that it was not intended so much to benefit the revenue as to protect the cultivator of the soil. Now if that is the case, and at the same time the revenue have been benefited; that is, received considerable sums in the shape of duties upon the import of foreign grain, why not use those duties as bounties upon the exportation of corn of British growth, when the prices are so ruinously low as they have now been for a great length of time? It is my opinion that the very idea of a bounty on exportation would in some measure keep the prices buoyant, and prevent that deep distress which is now experienced. I do not know precisely what ought to be the amount of these bounties, but should suggest that, when the average of wheat is at or under 40s, a bounty of 10s might be allowed,—and for every shilling above 40s, up to 50s,—one shilling per qr additional should be added to the bounty, making 50s a bounty of 20s per qr; if with such encouragement we could in any one year be exporters of one million qrs of wheat over and above what is required for our own consumption, and which would realize to the exporter 30s per qr, the country would receive one and a half million pounds sterling for that which is entirely produced from the labour and industry of our own population. But I have no idea that one million, or even half that quantity, would ever be sent out in one year,—consequently the revenue would never be called upon for any large amount of bounties. I should suggest, also, that if any individual, not wishing to send his corn abroad, but should prefer warehousing it at home, such grain should go under lock, and be subject to the same duties, rules, and regulations, as if of foreign produce.

It may be said that the trading part of the community might find fault with any part of the revenue being employed as above; but when they recollect that parliament have granted, and are granting great privileges and conveniences in the shape of railways, &c., throughout the kingdom,—which privileges are principally for the use and benefit of trade, and in some measure to the injury of agriculture, in reducing the necessity of horses, and considerably lessening the consumption of oats, beans, hay, &c.; surely that will be a sufficient answer to such objections.

Much has been said about the currency; it is my opinion that the currency has but little to do with the price of produce. With so much capital in the country, how should it not affect the price of barley, oats, beans, wool, &c., as well as wheat? Depend upon it the demand and the supply will in all cases eventually regulate the price. I am sure there is no want of capital in the country. I remember when corn was sold in the Wakefield and Manchester markets,—and generally after giving a month's credit, was paid for in a bill at two months; now nearly the whole which you receive is in cash, for which the buyers receive a discount.

I should also recommend the introduction of poor laws into Ireland,—a small additional duty upon tallow, and also upon flax; the cultivation of the latter article is of vast importance to us,

and particularly to Ireland,—the preparation of which causes a great deal of labour. Something has been said about taking the duty off cloverseed; I object to it on the principle of its departing from a system of taxing all articles of foreign produce, whether consumed by the merchant, manufacturer, or agriculturist.—I am, my lord, your most obedient,

J. B.

March 15.

## AGRICULTURAL DISTRESS REMEDY.

The *Strathmore Journal*, in referring to this subject, has the following remarks:—

“The following distress took place last week as to the distress of the Scotch agriculturists, on the presentation of a petition from Ross-shire, by Mr. Stewart Mackenzie. We believe that the honourable member stated the best remedy for the depression of the tenantry, to consist in ‘an adjustment of the rent to the prices of produce.’ In a very few words, we have at once the ‘bane and the antidote;’ and to this reasonable arrangement, among agriculturists, landlords, and tenants, should direct their efforts. We rather think, that however accordant with commercial principles, the reduction of the duty on foreign seeds would neither be advisable nor practicable. In the first place, though the saving to the revenue would not be great, still many would suppose that some other party should be relieved in preference; and, secondly, the tax being taken off, the domestic culture of seeds might be consequently given up. Grass seeds are now cultivated to a considerable extent in this country, and we doubt not that their culture will extend, and may be not a little stimulated by the continuance of a duty on importation.”

The *Constitutional* after quoting the preceding extract, says,—

“We are not much in the habit of quoting the *Strathmore Journal* as an authority, either in accurate statement or sound reasoning—and we have therefore the greater pleasure in referring, with approbation, to the closing sentences in the above paragraph—sentences, the soundness of whose statements surprised us the more, after we had referred to the journal's file for March, 1834, &c.”

What the critic says of the theatrical stage, would seem to apply equally to the political, for when extreme parties “do agree, their unanimity is wonderful.” The singularity in this instance is not a little enhanced by the circumstance, that the unanimity is one in error, as five minutes conversation with any intelligent farmer, will at once convince them. The doctrine of protecting duties does not apply equally to clover seed as to corn; for this reason, that there is not exceeding, perhaps, a few tons of clover seed saved in Scotland annually. This is not owing to the want of protection and encouragement—for, in addition to the heavy protecting duty, the Highland Society and other local institutions, for several years, offered handsome premiums to the most successful cultivator of grass seeds; but the result of the trial served to show that the climate of this country was not favourable for the purpose, and the seed saved was not only inferior in quality, but the crop was less profitable than the usual rotation, and proved a great scourger of the soil. The well-known fact of seed grown under a favourable climate for ripening it, being always more productive than native grown, is peculiarly the case with grass seeds; and, therefore, the attempt to extend their cultivation has always met with the ill success which follows the endeavour to strive against natural difficulties. On these grounds we differ from our contemporaries, and consider that the reduction of the duty on foreign seeds would be both “advisable” and “practicable.”—*Perth Courier*.

## THE PARKS.

The observations contained in this letter are equally applicable to other parks and pleasure grounds, as to those particularly alluded to.

## THE CHIEF COMMISSIONER OF WOODS AND FORESTS.

MR. EDITOR,—Having frequently addressed you on the subject of the parks, and taking a very lively interest in these places of public resort, I venture once more to trespass on your valuable and impartial columns by requesting the insertion of a few observations, relative to these places set apart for the recreation of the people, in the earnest hope that what I am about to state may draw the attention of Lord Duncannon to this very important branch of the public property committed to his charge, and may induce him to continue and persevere in the good works of improvement, as well as embellishment, which have been commendably carried on by his predecessors. Much yet remains to be done, and I will venture unhesitatingly to say that every shilling expended in beautifying and improving the places appropriated for public recreation and amusement, so aptly termed *the lungs of the metropolis*—every shilling laid out in embellishing these delightful retreats from the noise and confusion of the crowded streets, will be an additional attraction in withdrawing the people from the gin-shops and public-houses, particularly on Sundays, and will aid, and very cogently too, in the attainment of the object Sir Andrew Agnew has been, through legislative interference, endeavouring to accomplish, by leading people to a cheerful, rational, and salutary observance of the Sabbath. After this preface I will proceed at once to my proposition, which is by the introduction of Rhododendrons, Calmias, Azaleas, and Andromedas, in very considerable numbers, to convert the three Parks and Kensington Gardens into *American pleasure grounds*. What I would suggest is to fringe the margins of *all the plantations* with these profusely-flowering shrubs, and to have a belt of them lining the gravel walk from the artificial waterfall on the Serpentine to the bridge at Kensington-gardens, opposite the Royal Humane Society's building. This will produce the rich effect of a mass of flowers interposing between the lake and the observer from the drive above either walking or riding, and from the opposite side to those in the carriages will likewise form an equally desirable feature in the landscape. The island and peninsula in St. James's-park, if covered with rhododendrons, would greatly enrich the views from the Palace windows, and would produce a most brilliant effect from every part of the park. The advantages of this class of flowering ornamental shrubs are great and numerous.

1. Their hardness and cheapness are strong recommendations. Mr. Hammond, of Bagshot, offers a number of strong plants of "rhododendron ponticum" at 33s a 100—somewhere about 16l 10s a 1,000; this price to include carriage. They are of rapid growth, and have the habit of growing and expanding *outwards* more than *upwards*, thus increasing in bulk instead of altitude, and seldom attaining a height exceeding four or five feet. They become most admirably suited for a fore-ground to all ornamental clumps of trees and young plantations.

2. The ease and facility with which all this class of plants may be transplanted and removed at any time, at any size, and at any age, and so far from

being injured by this process it is rather beneficial to them than otherwise; never requiring to be cut down to thin the plantations, or pruned, to waste, as is the case at present with the recent plantations in St. James's park.

3. The consequent increased value of the plants as they grow in size and age, and become stock, ready whenever required for making additional improvements and clumps of flowering shrubs in other parts of the Parks—any apprehension of damage by transplanting being needless.

4. The very seasonable time when this beautiful class of plants come into flower, blossoming from the middle of May, and continuing their loveliness till the end of June, the very time when London is filled, and all the world at hand to enjoy the gay display. After which the rhododendrons, being ever-greens, will be ornamental till the returning spring calls them into beauty again; and in the islands of St. James's-park they will both in winter and summer afford the very best protection for the water-fowl. Whilst when in flower the reflection on the water of such immense masses of blossoms will be of unrivalled beauty and magnificence. All these advantages combined will, I most earnestly hope and trust, induce Lord Duncannon to lend a favourable ear to this proposition. Our four Parks will thus become, and very shortly too, the most beautiful and enjoyable public grounds in Europe, and at no great expense either, for Messrs. Loddiges, of Hackney; Waterer, of Knap Hill, Surrey; and Jenkins, of Portman Nursery, have all large stocks of American plants at reasonable prices. In conclusion I will quote a passage from a recent work on ornamental planting:—

"The beauty of English park scenery is universally admitted—the constant source of fresh admiration to foreigners, and of delight to ourselves. It may, perhaps, be briefly described as the art of imitating, in small compass, the most lovely scenes of external nature. In a pursuit so fascinating, the most elegant mind may find amusement, the most active benevolence room in which to dilate, in eliciting from crude materials new forms of beauty, converting the once naked district with luxuriance, the worth of an estate (or park) is improved (and let me add,) *its enjoyable utility thrice multiplied*, health is improved, and charity the most useful dispensed. Many are the beauties in detail which may be gained by a more frequent use of foreign vegetation. In a well-ornamented park, where a judicious intermixture of foreign trees and shrubs are introduced, the interest is not confined to the picturesque effect they produce, for they remind us of the climes whence they come, and the scenes with which they are associated.—Always, Mr. Editor, your constant reader.

RUS IN URBE.

MR. EDITOR,—It was my intention some time ago to do myself the pleasure of sending you an account of the *Lolium italicum*, a species of ryegrass lately introduced from the Continent, and with which we have been making experiments at the Farm through the summer; but wishing to see how it stood the alterations of the weather through the winter, the communication was deferred until now.

It was sown on the 1st of May, and although the weather at that time was exceedingly dry, we were astonished at the rapidity of its growth. It was five inches high on the 14th, and on the 23rd

of June it had attained the height of twelve inches. It was cut on the 1st of November, and again cut in the beginning of January; producing each time heavy crops. It appears to partake more of the qualities of the natural grasses than the rye-grass, being in a great measure divested of that stickiness which characterises all the loliums. Horses, cattle, and hares prefer it to all other grass: the hares seem to have set their affections on it—disregarding alike the admonitions of trap and snare.

The *Buliten des Sciences Agricoles* says, "This plant is distinguished from the common rye-grass (*lolium perenne*) by its larger leaves, by its being of deeper green, and by the greater height to which it grows. It is usually sown in the autumn, as is the general practice in the South of Europe. If it be sown with clover or lucern it will quickly choke them, its growth being so rapid. It is softer, more juicy, of a richer foliage, and more relished by cattle than the common rye-grass." It is not yet ascertained whether it is an annual or perennial. Were we to cultivate this hybridous plant extensively, we would sow it on land under a corn crop; but not until the corn had attained a sufficient height to exclude part of the light and air—so beneficial to the growth of plants. This would, in a great measure, counteract the choking of which our Continental neighbours seem so much afraid. In my humble opinion this grass will, at no distant period, occupy a distinguished place in British husbandry.

If you think this worthy a place in your valuable paper, pray insert it.—I am, Sir, your most obedient servant,

JOHN BLACK.

*Marske Farm, March 17th, 1836.*

### IMPORTANT TO HOP MERCHANTS.

An action was tried a short time since in the Court of Common Pleas, of importance to persons ordering goods to be conveyed by sea. Messrs. Johnson and Co. hop merchants, of Aldermanbury Church-yard, the plaintiffs, sought to recover of Mr. Pattle, Grocer, of Bury, the defendant, 86l. 2s. 7d. the amount of an acceptance for ten pockets of hops, which were ordered by the defendant of the plaintiffs' traveller on the fourth of October, 1834, with directions to forward them on the following Thursday (the 9th) to the Wool Quay, on the water side, to be shipped by the next vessel for Ipswich. On the next day (the 10th) the defendant received by post an invoice of the hops, with a letter stating that they had been shipped. It appeared that a vessel "the August," sailed from that Quay on the morning of the 10th for Ipswich, and if the hops had been delivered as asserted on the 9th they would have been forwarded by that vessel, which safely arrived at Ipswich. The defendant, upon the faith of the statement made to him with the invoice, accepted the bill for the amount and returned it by post on the 10th to the plaintiffs. The defendant not having received the hops, wrote to the plaintiff on the 20th, inquiring about them, and received in answer a letter from them repeating their former assertion that they had been sent to the wharf on the 9th. It appeared, however, that they had not been sent until the following Tuesday (the 14th) when they were shipped on board "the Neptune" for Ipswich, and that vessel with all the cargo was lost at sea. The defendant, hearing of the loss, wrote to the plaintiffs either to return his acceptance or to send him ten other pockets in lieu of those which he had not received; this they refused to do, and brought this ac-

tion for the amount of the bill, contending that the loss was the defendant's. Mr. Sargeant Wilde conducted the plaintiff's case, and Mr. Kelly the defendant's. The Lord Chief Justice charged the Jury, who, after a short consultation, returned a verdict for the defendant.

HEREFORD.—*John Collard*, toll collector at one of the city gates, appeared before the magistrates under the act of the 4th Geo. 4, for having on the 4th and 7th of March instant, demanded and received from T. Tringham 1s 3d each time, as toll for three horses to which a thrashing machine was attached, instead of 4½d the usual charge.—Mr. Sill appeared for the complainant, and Mr. Humfrys attended for the toll collector.—T. Tringham was examined at great length, and proved to having paid 1s 3d in the first instance, and having his watch detained on the second, which was afterwards given up on payment of the money.—Mr. Humfrys, in a very long and eloquent address, ingeniously endeavoured to show that thrashing machines were liable to toll, and were never intended by the legislature to be exempt, as it was only by a straining of the words of the act of parliament that a thrashing machine could be considered an implement of husbandry, any more than a cider mill, or any other engine employed in agriculture. He cited a variety of authorities in support of his opinion; urging the magistrates to dismiss the case, as in the event of a conviction, there could be no appeal against their decision but to the quarter sessions; when, if the case was dismissed, persons claiming exemption of toll for thrashing machines might bring their action, and the first law authorities of the kingdom would then decide upon the case, and set the question at rest for ever. Mr. Sill, for the complainant, contended that the thrashing machine was as much an implement of husbandry as a plough or a harrow, inasmuch as it was wholly and solely for agricultural purposes. He quoted an authority to show that machine and implement were synonymous, and said that he perfectly agreed with Mr. Humfrys on the impropriety of straining the meaning of acts of parliament, and therefore, as this act of 4 Geo. 4, was framed for the peculiar benefit of the farmer, it would be indeed straining its meaning to decide that a thrashing machine—an implement now in such general use—was liable to the toll. He pressed the magistrates to convict; and said that if the defendant found himself aggrieved, he might appeal to the sessions, where the magistrates, residing as they did in an agricultural county, were quite as capable of deciding what was, or was not, an implement of husbandry, as the king's judges could be, who were living in London. The mayor said, that he and his brother magistrates were decidedly of opinion that a thrashing machine was an implement of husbandry, and was no doubt considered as such by the commissioners of the turnpike trust. He must therefore convict the defendant for enforcing the toll in this case.—Mr. Humfrys said, that whatever his own opinions were, he bowed with submission to the decision of the magistrates; but as the act of parliament was worded ambiguously, and his client had no doubt erred in consequence of considering that thrashing machines were liable, he (Mr. H.) trusted that the magistrates would mitigate the penalties.—Mr. Sill said that he was instructed by the complainant not to press for the full amount of the penalty, and also not to press the second case to a conviction.—The mayor then ordered the toll collector to pay 20s and 6s costs, which was paid.—*Hereford Times.*

## AGRICULTURAL REPORTS.

### BERKSHIRE.

Towards the end of the last month we had a great deal of rain and snow, and up to the present day the weather continues unsettled; the land, in consequence, has become so wet that the plough is stopped, except on light Down land or sandy or gravelly soils. The farmer who is silly enough now to try to get forward by cross ploughing strong or clay soils, will find to his sorrow that he has been making double work, and perhaps lose his crop into the bargain. Most of the beans and peas in this county are planted, and the land finished off exceedingly well. A considerable portion of the oats have been sown under the most favourable circumstances, but those who neglected to get in the oats on the strong land during the dry weather must now wait with patience until the weather is more suitable. Most of the barley land has been cross ploughed, and will be in a most excellent state for the reception of the seed, provided the weather is dry; but if the sowing season (now the land works so fine) should be wet, it will be a bad job, as the strong flat land would be little better than a heap of mud. Barley sowing will commence as soon as the weather will permit, as it is well known that the early-sown generally produces the finest quality, and the high tax upon malt excludes almost all other sorts from being malted, except in years when there cannot be obtained a sufficient quantity of the best quality. A pretty large breadth of the Chevalier barley will be sown this season, for on some soils, and when sown early, the quality last year was most excellent; but some farmers seem even now to be fearful of sowing any great quantity, as it certainly will not stand a wet harvest, and in some places does not yield near so well as the old sorts; we know of some few brewers who refuse to use the malt made from the same, because they say the beer made from such malt will not keep, while other brewers speak altogether so highly in its praise. The thrasher does not like the Chevalier barley at all, and complains that it both thrashes and yields far worse than any other sort. The opinion of persons respecting its merits seem to be vastly different, but still we think that most persons will try a little of it this season. We are sorry to report that the wheat is of late very much altered for the worse, and many persons begin to be seriously alarmed at the appearance of the plant, and are fearful that in some places the whole of it will die; on high hills and in exposed situations, and especially where it was sown late, and the land not in high condition, it looks nearly as bare as a fallow field, and scarcely a blade can be seen; and we hear already of many pieces being doomed to be ploughed up and sown with other grain. It appears that the frosts have so hollowed up the soil that the root has nearly, or quite, let go of the same; and the sharp cutting winds having at the same time withered the blade, the plant has been destroyed, or so materially injured, that it is fearful much of it will never recover. It was hoped that the late heavy rains would have again settled down the soil, and have enabled the plant to take a fresh hold, and in some

instances this has been the case; but much of the late sown wheat that was not pressed down firm at the time it was sown, now cuts a most deplorable figure, and the utmost anxiety and fear is entertained by the owner that he shall have a failing crop. The wheat has not for many years assumed such a blind and barren appearance in the month of March as it does at the present time, and many farmers are anxiously waiting to get the land dry enough to press it down with a heavy roller. Vetches and winter barley are both looking bad, and the continual frosty or wet nights make their appearance get worse and worse. The young grass has been also much cut up by the frost, and in some situations it has lost stock, and there will be scarcely half a crop. The trifolium in many places is completely gone, and not a blade left behind, while in some other places it seems to stand its ground pretty well. Turnip seed has become uncommonly scarce; the land being most of it sown two or three times over last season, and as there are this spring but few turnips that can be left for seed, it is fully expected that turnip seed cannot be cheap for at least another year to come. Swede seed is tolerably plentiful, but as Swedes are now become quite a favourite with the farmers, a large quantity of seed will be required. Potatoes are scarce, and good ones are selling as high as from 7s to 10s per sack. The weather of late has been very unfavourable for young lambs, and many have perished from wet and cold. The ewes in many places are very poor and short of milk, and there is little or no food for the lambs, and we seem fearful that the number bred this season will be much less than usual. There has been but few ewes die this season, and we scarcely ever hear of much loss of ewes in the lambing when they are in poor condition. The lying so much on the hot dung in the yards, because the weather has been so unfavourable, has in some places brought the scour amongst the lambs. Sheep keep is likely to be very scarce. Pigs have of late risen in price most rapidly; and young colts seem to be getting dearer. The deficiency in the crop of wheat last year has at length been discovered, and since our last report the wheat has advanced in price about 10s per qr; whether there will be any further advance will certainly depend much on the prospect of the next crop; but we shall not be at all surprised at the price getting still higher, for the following reasons:—1st. There is not the usual breadth of wheat sown this year by, it is supposed, about a fifth, the land being left for barley and oats, because these crops of late years have paid best. 2nd. Although the ricks standing about the country are numerous, yet it is certain there is not the quantity of wheat as many persons have expected, the yield out of the straw being so very bad. 3rd. The dearness and scarcity of potatoes and other vegetables cause a far greater consumption of wheat than usual, and the manufacturers being in constant employment at good wages, they have plenty of cash to purchase the same, and a great consumption seems likely to continue. 4th. The cold wet state of the land, and the backward

appearance of the plant, seem to forebode a late harvest, and a late harvest never produces a good quality, or scarcely ever a great quantity, and as the wheat is a great part of it thin on the ground, the prospect of the growing crop at the present time is far from favourable; these, and other reasons, will no doubt have some weight with the speculators, and help to change the minds of both buyers and sellers, and we shall not wonder that if even an attempt were to be made to release the foreign wheat from bond before the farmer can secure another crop, and especially if the harvest should be a backward one; but we do most sincerely hope that this will not be permitted to take place in the present distressing time, for to the poor farmer it would be a most cruel thing. We are aware there was a large stock of old wheat in hand after last harvest, but in consequence of the lowness of the price a vast deal has been given to pigs and sheep, and there is not a large quantity left to consume. It is to be hoped that the present advance in the market will not make the farmers forget their difficulties, or neglect to bring up their witnesses before the committee, so as to prove a good case, for it would be both absurd and foolish to ask for a hearing and then have nothing to say; and the Agricultural Committee, instead of proving a benefit, would be a laughing stock to the whole world. The farmers must not by any means leave a stone unturned, or the least shrink or relaxation in their exertions to prove a complete case, so that no eloquence or sophistry of their opponents can get over or set aside their statements.—March 7.

#### GLAMORGANSHIRE.

The weather has for the last month or six weeks been remarkably wet and changeable; cold rain and sleet in the low lands, and in the hilly districts, it generally came down in snow, which remained some time on the ground. Heavy showers of hail of unusual size we have also experienced, and a long succession of windy boisterous weather. Hitherto there is little prospect of any "March dust," and whatever benefits it may possess we shall not enjoy them this season. For all farming operation this weather has been most unpropitious; the land having been so much saturated with wet is unfit for ploughing, and this operation is very backward; at least two-thirds of the barley fallows are yet to be cross ploughed. The latter end of February and beginning of March being the lambing season in this county has proved this year most unfavourable, and a great many losses has taken place. Turnips being a deficient crop, the flocks generally are in low condition. The wheat continued to assume a good colour, although not thick until the middle of last month, but the repeated drenchings it has received, accompanied by cold cutting winds, has made it look bare, and the blade is withered. In wet and retentive soils, we suspect a portion of the plant is destroyed. The state of the land has prevented the crop from being yet hoed, which operation has only just been commenced. The young grass seeds are not a regular plant, and we cannot report favourably of the trifolium incarnatum. A great portion of the plants are destroyed, and those remaining are weak and withered. We suspect that September and October is rather late for sowing to secure a crop in all seasons.

Our spring fairs for live stock have produced better prices, with a good demand for cattle and sheep. Mutton is very scarce, and is worth 7d, and prime beef 6d per lb sinking the offal. Pigs have also improved in price; the quantity of pork in market has been less in the last winter by at least a third than

in the two preceding winters. Potatoes are worth 5s a sack, and good hay 3l a ton. The wheat market has improved since Christmas about 1s a bushel, and we expect will improve another 1s a bushel early in the summer, which will then be less than the cost of producing it. There may be the usual quantity on the straw at this season of the year, but it will be found that the breadth sown is greatly diminished, and should the season prove unfavourable a great deficiency may arise.

The parliamentary committees now sitting are not likely to recommend the adoption of any measures which will produce an immediate advance in the price of wheat, but we trust they will be able to suggest measures which may prevent a recurrence of the ruinous prices we have recently experienced, as well as a more equal distribution of those burdens which are now borne almost exclusively by the occupiers of land, and also that the English and Irish growers should be placed on a more equal footing in the same market.—March 17.

#### DURHAM.

The weather throughout the winter has been a series of perpetual transition from frost to thaw twice and thrice in twenty-four hours, with frequent intermediate storms of wind and rain, and seldom or never continuing the same for forty-eight hours. The effect has been severe, as may be supposed, upon the young wheat, which, from being put into the ground under inauspicious circumstances, was ill-calculated to bear hardship; when we say inauspicious, we assert that we never remember to have seen wheat podged, in so unhusbanlike a manner as last season. The great breadth of wheat is grown upon the poorest clayey soils which will grow nothing else, and this description of land is occupied principally by farmers of little capital, which capital of late years has been diminishing, and the land of course worse cultivated, and instead of the fallows getting fine ploughings and harrowings, and otherwise well cleaned, manure and lime applied, as it formerly did, three-fifths of this description of land only gets three ploughings, little harrowing, and no hand gathering, and as little manure and lime applied. What is to be expected from hand cultivated thus? The wheat sown upon such land in a wet season, when the furrow was running together after the plough, what is to be expected but deterioration, retrogradation, and bad crops? But to this there is this year added to the above a more powerful cause—an unfavourable winter and spring; never did we see wheat look so badly, there are thousands of acres on which a blade of corn cannot be discerned, and there are again, thousands of acres that are lying yet unsown, and which ought to have been sown in the autumn, but which now cannot possibly be sown.

Wheat has improved a little in price of late, but is still below par.

Fat cattle, owing to the very flourishing state of our manufactories in Lancashire and the West Riding, is in great demand, and at good prices, say beef from 5s 6d to 6s 6d per stone, and mutton from 6d to 7d per lb, sinking offal.

Wool is also in urgent demand at various prices.—March 18.

#### PERTHSHIRE.

Throughout the month of February the weather continued to exhibit frequent variations of frost, fresh, snow, sleet, rain, and high and boisterous winds. Towards the end of the month, the soil on the lower districts had become tolerably dry, and some spring wheat was got in on a dry bed; a few beans, too, were sown under favourable circum-

stances, but an early spring seed-time was prevented by a heavy fall of snow in the higher districts, and of rain in the southern and lower parts of the county on the first day of March, and from that time rain and sleet have been so frequent, as to have completely saturated the soil, which will for some time to come retard the progress of sowing spring seeds. Wheat was for the most part late in sowing last autumn, and the young and tender plants have suffered considerably by the alternating frosts and rains, since our last. The general appearance is at present by no means flattering. Clover plants stand out better. Turnips have been longer in running to flower stem than usual, they are now nearly off the ground. In the corn market prices are rather improving. Wheat has much room to rise, and in that article a considerable rise is anticipated. The season for the barley market is nearly over, and there is little on hand. Oats are much in request and are advancing in price. Potatoes bring higher prices than usual, but there are not many on hand. Fat cattle are rather scarce, and prices begin to look up. Milch cows are not yet much inquired after. Good first-rate horses improve in price, inferior descriptions are plenty, and low prices are offered.—March 7.

### GENERAL AGRICULTURAL REPORT FOR MARCH.

The weather, which we consider to be the most powerful ruler of agricultural operations and productions, and, for these reasons, generally make it the principal or leading theme of our report, was, from the commencement till 18th of the month, rather turbulent and sloppy, as well as detrimental, in many exposed situations, to the thatch of out-buildings, hay and corn stacks, and some few dwelling houses, consequently was not very favourable to ploughing, sowing, or any other kind of out-door farm labour; nor was it during that period more vegetative, if so much so, as that of February. As, however, the fine dry, and comparatively mild weather of that month enabled farmers to proceed with ploughing and sowing of oats, and other Lent grain, to a much greater extent than usual, field labour is at this time by no means out of its place; though, as was observed a few days ago, by a somewhat eccentric Sussex farmer, with whom we have had fully a forty years' acquaintance, that "March had been quite as windy and sloppy, and that I myself I, member of parliament for Birmingham, and they silly men who call themselves members of the centre" (we suppose central) "committee, have been talking as much nonsense about farming as need be!"

But, as further relates to vegetation, since the 18th, the subsequent mild night air, and almost summer-like sunny days have given to the growing wheat and all other growing crops; to early budding and blooming shrubs, fruit and forest trees, and in brief, the whole vegetable face of nature, a most lively, spring-like, animated, and otherwise inviting complexion. It has been a general remark with the farmers we have seen in the course of the present week, that they do not recollect to have witnessed so sudden and pleasing a change in the complexion of the rural scenery by which they are surrounded, and which they have in the course of their last week's travels passed, for some years. The poor land wheat crops are, however, represented as exhibiting a sickly appearance; but the flocks, herds, and every other description of live farm stock, as generally healthy, and though, in some instances, rather low in condition, doing, in

the whole, tolerably well, without the depastured part of it having laid very heavy hay stack contributions; yet, there are still almost general complaints of fat sheep and beasts not being so fat, consequently not weighing so heavy, or carrying so much internal fat as in the corresponding season of some past years. The lambing season of the Southdown flocks, which is, in most of them, from old to new Lady-tide, is said to have partially commenced, by flock-masters, who wish to become experimentalists about the middle of the month, and to have so far been productive of fine strong lambs.

As to the primary cause of the existing agricultural misery, there is no intelligent farmer fifty years old, at this time living, who does not know it was caused by the establishment and numerous increase of country banks. As early as the year 1797, these agricultural and commercial pestilences began to rapidly accommodate; and by the commencement of the present century had begun to purchase, or enable others to purchase, farms, or to greatly enlarge those they were already occupying by hiring those of small farmers over, as it is termed, their occupant's head. The enormous advance on the tithes has greatly contributed to agricultural distress, and for which no committee, or other legislative means, except as we intimated in our last month's report, an entire abolition, or very wholesome commutation, to which the bishops seem disposed unwillingly to submit, and mutual good feeling between landlord and tenant, can give relief. As, however, there seems to be a considerable number of landlords and tenants who seemed disposed to an equitable, amicable, or live-and-let-live system, we, with a view of endeavouring to promote their united interests, extract the following passages for their perusal, from the Rev. A. Dickson's Agriculture of the Ancients, who, speaking of Columellas' instructions to the Roman landlords, advises them "to retain upon their lands the same industrious farmers that have been bred upon them, declaring, upon the authority of L. Volusus, that that estate is most advantageous that is cultivated by them; men, with their education," he adds "naturally imbibe attachments; they acquire a love to the place where they were born and brought up, and they continue to honour a family which, from their infancy, they have been taught to admire. Tenants, therefore," he proceeds, "that have been brought up on the lands which they farm, must have an attachment to them, and a respect for the landlord. On these accounts," continues the Rev. Author, "they are certainly preferable to strangers; for, with their attachments, having no thoughts of being removed, they do justice both to the land and landlord; whereas, strangers, having no attachments, and expecting a removal, endeavour to make the most of both, and this they often have in their power, in spite of all restrictions. But, if rents are raised," he further adds, "till farmers are obliged to renounce all the enjoyments of life, it is certain that bad consequences must follow; the farmers become dispirited, agriculture declines, and the rent and value of lands fall."

Farmers signify that it appears to them, from the vacillating manner of Lord John Russell, that his Lordship scarcely knows what to be at; though we conceive that, if he pay proper attention to the precepts of Columella, contained in the foregoing extracts, and gives their equitable weight, in his political balance, he has exceedingly little to do.

Here follows our Smithfield retrospect, in reference to supplies, prices, &c., from the 26th of Feb. to the 21st of March inclusive. On the first Friday of the month, much inquiry was excited, by a two-

years old Herefordshire Bull, denominated Young Constitution, bred by Wm. Hewer, Esq., of North Leach, Gloucestershire; sketched, by Mr. Davis, of Church Street, Great Chelsea; and sent by Messrs. Gurrier and Giblett, salesmen of Smithfield, to a friend of theirs, in Aberdeenshire. The symmetry of the bull was remarkably fine, and his countenance as placid, mild, and tranquil, as that of the most mild complexioned, and otherwise beautiful, lamb! The circumstance of his going to Scotland, has given rise, in Smithfield, to the suppositions that crosses between him, and both the Fife and Aberdeenshire Scots, are contemplated.

PRICES.

	Feb. 26.		March 21.	
	s. d.	s. d.	s. d.	s. d.
Inferior Beef	2 4	to 4 8	2 4	to 2 6
Ditto Mutton	2 8	to 3 0	3 2	to 3 6
Middling Beef	2 10	to 3 2	2 10	to 3 6
Ditto Mutton	3 6	to 3 10	4 2	to 4 8
Prime Beef	4 2	to 4 8	4 4	to 4 6
Ditto Mutton	4 6	to 5 0	5 2	to 5 8
Lamb	5 4	to 6 4	5 6	to 6 6
Veal	4 2	to 5 2	4 4	to 5 4
Pork	3 6	to 4 8	3 6	to 4 8

During the above-mentioned period, about 1080 of the beasts came from our northern districts, via., Lincolnshire, Leicestershire, Northamptonshire, &c, up the Great North, or St. Alban's road; about 1070 from our other northern districts; about 5750 from Norfolk, Suffolk, Essex, and Cambridgeshire, but principally from the former county; about 800 from the western and midland districts; about 690 from Scotland, by steam vessels; about 530 from Kent, Sussex, and Surrey; and the remainder from the stall-feeders, cow-keepers, &c., in the vicinity of London.

A full moiety of the above beasts—as is usual from the commencement of February to the coming into season of the grass fattened beasts—were chiefly Scots; the remainder, in about equal numbers of short-horns, Devons, Herefords, and Welsh runts, with, in the course of the month, about 300 Sussex beasts, 150 Townsend cows, and a few Irish beasts—the latter becoming scarce, and much out of favour.

The sheep and lambs, as we intimated in our last month's report, have come in irregular droves from all sides of London, but, if Norfolk be excepted, very few of them from our distant grazing districts. The sheep have chiefly consisted of New Leicesters, South Downs, Kents, Kentish half-breds, and polled Norfolk; with a few Old Leicesters, and Lincolns; horned Dorsets and Somersets; horned and polled Scotch and Welsh sheep, &c. The lambs have hitherto consisted of about equal numbers of South-Downs, New Leicesters, and Dorsets. The calves and porkers are chiefly from Middlesex, Essex and Surrey.

There has been, in the course of the month, a great deal of slaughtered meat, by sea, from Scot-

land, and several of our northern and western districts.

A statement and comparison of supplies and prices of fat stock, exhibited and sold in Smithfield market, on Monday, March the 23d 1835, and Monday, March 21st 1836.

At per 8lbs sinking the Offals.

	March, 23, 1835.		March, 21, 1836.

Beasts	2,488	2,857
Sheep and lambs	22,490	15,380
Calves	81	220
Pigs	510	412

It will be seen, by the foregoing statement, that mutton was from 1s to 1s 8d; beef, 4d to 6d; veal, 4d to 6d; lamb, 2d to 4d, and pork, 6d to 8d per 8lbs dearer, on the 21st of March 1836, than on the 23d of that month in 1835.

The following are the numbers of cattle exhibited, in Smithfield, in the course of the month, ending on the 21st instant.

Beasts.	Sheep.	Lambs.	Calves.	Pigs.
12,040	75,170	2,850	1,805	3,177

Supply of preceding month.	12,511	96,210	300	1,795	2,275
----------------------------	--------	--------	-----	-------	-------

From which it appears, the supply of the present month embraced 471 beasts, and 21,040 sheep less; 2,550 lambs, 10 calves, and 902 pigs more than that of last month.

As further relates to the value of farm produce, both in the metropolitan and provincial markets, the prices of each kind of meat, of most kinds of corn, wool, hay, straw, poultry, and dairy produce, have exceeded their preceding month's currency; but have been occasionally somewhat vacillating; whilst those of hops—though, at this time, a little drooping—have been, in the whole, with milch cows, store pigs, and horses, about stationary.

SPRING CLOTHING.—The advent of the month of April reminds us of the necessity of throwing aside our Winter habiliments, and donning, as they say in some places, lighter species of clothing. To those who are about to adopt that step, we strongly recommend a visit to Messrs. Doudney's "City Clothing Establishment," Lombard-street, whose immense stock enables them to render articles of the very first quality upon terms highly advantageous to the purchaser. (See our Advertising Sheet.)

WOODHOUSE'S ESSENCE OF GINGER.—The eminent patronage which this essence experiences, is in itself a recommendation far outweighing anything which we can say in its favor. We beg, however, to add our testimony in further proof of its invaluable qualities in all cases of indigestion, flatulency, or disordered state of the stomach. The price with a full description of the mode of use, &c. will be found in our advertising pages.

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**DERBY CATTLE FAIR.**—There was a larger shew of cattle of different descriptions than has appeared for several years; very little was done however, except in those of prime quality; those sold, fetched a fair price, but not an extravagant one. Few good horses were exhibited; an excellent waggon colt sold for a great price.

**DERBY CHEESE FAIR.**—The supply of cheese was not so large as usual; prices ranged from 60s to 63s per cwt. A few superior dairies realized, for their latter make, three and four shillings more money. Prices rather declined at the latter end of the day, although nearly all was sold.

At **BISHOP'S CASTLE**, there was not the usual supply of bullocks, and they sold at high prices; fat cows 5½d to 6½d per lb.

At **ROSS** there was a small show of fat cattle, and the number of stores was also smaller than usual—the former sold from 6d to 6½d per lb; and the latter were in demand, and went at rather advanced prices. Fat sheep were in great request, and commanded from 7d to 7½d and 8d per lb.

At **LEOMINSTER** the supply of cattle was very good, both as to quality and numbers, and the sale brisk at about the same prices as at Ross. Sheep, pigs, and horses were in demand, and sold well.

At **GRANTHAM FAIR** there was a good supply of beasts of almost every description, and which appeared to sell very freely. The supply of sheep was moderate, and the sale brisk. The horse fair was, as usual, very small. Pigs were in demand, and fetched good prices.

**HORNCASTLE STOCK MART.**—Stock of all descriptions sold readily at an advance in price. More Sheep were penned this year than on any former Mart, and nearly every pen exchanged hands. There was also a considerable increase in the number of horned cattle, which were eagerly purchased at high prices. The show of horses was small and not much business done. Pigs sold well. This Mart, which has now been established six years, is the first Spring Stock Mart, and bids fair for being the largest in the county.

**NEWARK CARING FAIR.**—There was a better show of valuable horses than we have been accustomed to witness, particularly cart horses, which fetched high prices; meat beasts were from 7s to 8s per stone, stores fetched a good price; there was but a small quantity of sheep, but hogs of a superior kind was sold as high as 43s each; in fact, stock of all kinds seems to be advancing in price.

At **NORTHAMPTON FAIR** there was a good show of store beasts, the greater part of which were disposed of at an advance of 2l in 15l compared with the prices at this fair last year. A very indifferent show of fat beasts, which went off at about the prices given at our last fair. There were a few good milking beasts, which were sold at good prices. Good mutton, in the wool, fetched from 5s to 5s 4d per stone. There were few really good cart horses, but a great number of harness horses, in which there seemed a pretty brisk trade.

**COWBRIDGE FAIR** was considered by many respectable farmers a good one. Fat cattle sold 20 per cent. higher than they did this time last year. Wool being on the advance, keeps up the price of sheep, which were sold at this fair at 7d per lb., and oxen at 5d and 6d per lb. The cattle exhibited were fewer than usual.

At **WELLINGTON FAIR** there was a fine show of fat oxen which sold readily at 9s 6d to 10s per score. Lean stock were full 10 per cent dearer than it has been sold at the neighbouring fairs; fat sheep fetched 7d per lb in the wool; it was what the farmers term a selling fair.

**RETTFORD FAIR.**—The show of horned cattle was not large, but realized good prices—there were plenty

of buyers, and every person might have sold if they had felt so disposed. Fat stock were much inquired after, and realized 7s to 7s 6d, and in some instances 7s 9d per stone. Good drapes sold for from 11l to 14l per head, and lean stock from 8l to 13l each. Incalvers were not so well sold. The show of horses was not numerous, but both tolerably good ones and those of an indifferent kind were sold well. The quantity of sheep penned was small. Hogs fetched 50s to 55s per head, averaging in weight from 18lb to 13lb per qr.; ewes, from 38s to 44s each; fat ones fetched full 7d per lb. The show of pigs was meagre; store pigs, even small ones, were from 25s to 35s each, and sucklings were from 13s to 16s a piece. The cheese fair was but thinly supplied, and nearly the whole was quickly disposed of; old milk 46s to 57s; new 58s to 65s per cwt.

### MONTHLY REPORT OF THE WOOLLEN TRADE.

February is known in the Woollen Trade as a dull month; for once, however, it has proved the reverse, on the principle, we presume, that the exception establishes the rule. We think it would be difficult to name the corresponding month in any year, backwards to 1820, which approached to it, in the amount of business done in low woollens. In the halls and warehouses alike, goods of all colours, under 12s per yard, have been readily and even eagerly bought; and the stock of such goods is now, perhaps, smaller than at any time during the last eight or ten years. Of the destination of the goods sold in the finished state we can only speak with hesitation; since the rules by which we can form an opinion are, on the one hand—the known general character of the trade transacted by those houses, which have exhibited the greatest activity during the past month; and, on the other hand, the proportionate amount of purchases made by the buyers, who have visited the town from various markets at home and abroad. Perhaps we shall not be very wide of the truth, if we say that the larger proportion has been bought by London houses, much of which may be intended for the foreign trade, but the great bulk, doubtless, for the home market. No inconsiderable quantity of goods has been shipped to the United States; and, we believe, looking to the character of the shippers, as *bona fide* sales; or, if on consignment, not that particular mode of consignment which renders all prudent calculation of the relative proportion of supply and demand, almost impossible; and which deprives the consignee and owner of all control over the selling price; we allude to the ruinous system of consignment on advances. To other foreign markets less than the usual amount of goods has been sent.

In the fine qualities of woollen cloths, the trade of February has exhibited less activity. In this respect, the past month assimilates to the two or three immediately preceding; in all of which fine cloths were dull and very heavy of sale, and, we are decidedly convinced, unusually so. We are somewhat at a loss to account for this fact. It is true these qualities are principally needed in the spring months; and that it is yet too early for the wholesale houses to lay in stocks; but, admitting this, we cannot but think that the very evident shyness of the buyers with reference to fine woollens, indicates one or both of two things—either that there has been a smaller demand than usual during the last four months for such qualities, or that the stocks in the manufacturers' and merchants' hands are believed to be so considerable, that no great variation of price, or scarcity of particular kinds, need be apprehended, even should the spring demand be a full one. Certain

it is, whether the one or the other be the true hypothesis, or both in part true, there has been no anxiety to purchase fine woollens, at all approximating to that manifested in the inquiry for the lower kinds.

Such being the state of the woollen trade during February, an advance on the lower qualities of wool was unavoidable. The precise amount of that advance is very differently estimated; suffice it, that it is quite enough to render the position of the manufacturer and the merchant both difficult and hazardous. In our estimation indeed, there has not been a crisis in the trade, since the conclusion of the autumn of 1833, (and there have been many very puzzling conjunctures in that brief period) of more perplexing character or more difficult solution, nor one which involved more important consequences, than we apprehend will arise from the evolution of this. We shall brave the imputation of presumption, in offering our view of the facts of the case, and in suggesting one or two plain rules of conduct, for the calm consideration of the trade.

First, as to the facts of the case—its diagnosis, as our medical friends would say. In few words they are these:—all descriptions of low woollen cloths, whether in the balk or finished state, are scarce. Similar qualities in preparation cannot be laid in at the same price, as those now selling. Wool, of a quality suitable to manufacture such cloths, is deficient in quantity to meet the demand for the remaining months of the wool year. Second, as to the conduct to be pursued. It is clear that the price of wool must advance, and there are two principal parties interested in that advance—the holders of wool, and the consumers; understanding by the latter designation, specially in this instance, the manufacturer and the merchant. We offer no advice to the former—they will get what they can; to the latter it is a grave question how much they may give without producing reaction and stagnation. It is a rule now universally understood and admitted, that the price of a particular article is regulated by the degree of the demand for it. It is equally well understood that there is a point in the price beyond which a rise checks consumption, and leads to a sure and frequently rapid retrogression. The history of the wool and woollen trade since 1833, strikingly illustrates these two positions. The price of the raw material in 1834, as compared with the average of 1827 to 1830, may be roundly stated at 45 per cent. higher; and when after a ruinous struggle it fell at the conclusion of 1834, it still maintained, and has done since, an advance of not less than 30 per cent. At the latter advance, wool more than remunerates the grower; it is therefore evident that price may be sustained considerably above the point of remuneration, by an intense demand. The demand is *now intense*, and is becoming more so. The price will rise in consequence. Can it be sustained at the advance? or will it recede as

in 1834? These two questions resolve themselves into a very plain one;—will the advance check consumption? This question cannot be answered by a mere reference to former exigencies of a similar kind. It does not follow, that because wool fell in 1834, it will do so in June next, if in the mean time it should rise to the highest limit of that year. The demand may be greater now than during 1834—it may be growing in June next; the supply may at present be under some special circumstances of limitation. It is not our intention to obtrude a detailed statement of our views, either as to one or the other of these two great points of the case, nor yet (admitting that we have formed one) a definite answer to our own queries. Why then put them? Our reasons are simple, and we think sufficient. To put the case fully before those interested—to direct and limit inquiry specially to those facts of the case which have the same relation to a question of price, that the force of gravitation and the resistance of friction have to a question of practical mechanics. We have another reason for putting our queries. We wish to impress very strongly on the minds of the manufacturers, a corollary from the principle that the relative proportions of supply and demand regulate price, viz. *that as a rise of price is equal to a contraction of the demand, the production of goods ought to diminish in the ratio of the advance of price—if the rate of profit is to be kept up.* We shall not illustrate this corollary at length; to us it appears sufficiently clear and simple—but we will apply it. Wool is rising in price, and it will rise still higher before the clip. Goods must rise with it; but the rise of goods will meet with no inconsiderable resistance, and in all probability will fall short of the rise of the cost. If wool rises in price at the German fairs, as compared with 1835, the stocks of goods then on hand will produce a profit; if not, they will entail a loss on the holders. A rise of wool at the clip is so much a question of probability, a mere problem in the doctrine of chances—that it will be extremely unsafe to speculate on it; it is therefore incumbent on the manufacturers to diminish the production of woollens as the price of the raw material advances. By so doing they will preserve that equality of proportion betwixt the demand and the supply which ensures a profit; and will avoid any undue excess of stock on which to lose, should wool only realise at the clip the prices of last year. There are certain latitudes in which skilful seamen careful and scrupulously sail under close reefs; our good friends the manufacturers may be assured they are sailing in such a latitude; and the sooner they take in their spare canvass and make all snug, the better. They may else be taken aback, or carry the masts overboard, ere they have time to hand the sails, or “to pipe all hands on deck.”

Leeds, March 1.

## REVIEW OF THE CORN TRADE DURING THE MONTH OF MARCH.

The present and consequent effects of the weather have during the month of March occupied much of the interest and attention of the farmer. The cold weather previously experienced, had checked the growth of winter-sown corn, and the aspect of the wheats was far from flattering, the plant looking thin and stunted, and in many instances deprived of that rich and healthy green, the certain index of vigorous growth; rain having likewise set in, little progress was made in sowing for the first fortnight, and prospects generally were much less animating than had been accustomed to be witnessed for the four or five last seasons; a sudden change, however, was experienced, and which appeared to have an almost magic influence on vegetation, and a considerable breadth of Lent corn has been deposited in the

earth; the land for the most part being in excellent condition to receive the seed, and facilitate its early germination. The advanced prices of wheat have been fully maintained, and barley has also improved in value: thus far the present condition of the agriculturist affords a favourable view; but as regards their ultimate condition *radically speaking*, their *political* friends have not been yet enabled much to brighten their prospects. The currency remains unaltered, the barrier, amongst certain empirics, against all improvement, and even the late enhancement in the quotations, is attributed by these *worthies* to a trifling increased circulation on the part of some of the joint-stock banks. The examination of witnesses is proceeding before the committees of the Houses of Lords and Commons, and no doubt a mass

of evidence is being collected, which will be of more interest as a subject of reference and information, than conducive to any practical and beneficial result. The commutation of tithes still remains under the consideration of parliament; the principal clauses of the bill have excited a general feeling of dissatisfaction on the part of the landed proprietors, and several deputations have had conferences with Lord John Russell, representing the injustice of the measure. The objections, which are well founded, may be briefly stated to arise principally from that fact, and not based on any cavilling or factious opposition.

Tithe, as at present constituted, depends on the seasons, and on the capital and industry of the cultivator, and adapts itself in a measure to current circumstances; it is now proposed to commute this to a perpetual rent-charge on the estate, estimated on an average of the last seven years' gross produce of the soil, but deducting 25 per cent from the customary demand of the tithe-owner. The injustice of this proposition may be readily exemplified in the case of 1000 acres of land, of the same character and properties, cultivated in equal proportions by two individuals. One farmer possesses capital, practical knowledge, and personal industry, and brings forth the powers of the land in yielding a fertile produce; the other lays down his land in pasturage, or has little capital, and is negligent of his interest, and though he keeps the ground arable yet his crops are scanty and inferior, and do not realize within half or two-fifths of those of his more diligent neighbour, whose 500 acres are to be burthened for ever with a tax, originating entirely from his own money and labour, and double in amount to the charge levied on the other moiety of the ground;—“*this is too bad.*” The tithe ought justly to fluctuate with the annual value of corn; or at all events to be charged on the gross rent of the land, as it is almost impossible to ascertain the intrinsic value of the soil, which next to corn tithes is the most equitable mode of adjusting this complicated measure: the clauses regarding hop plantations, garden grounds, &c., are liable likewise to much objection;—in fact the clauses of this bill appear to have been framed without a due regard, or with a very superficial knowledge of their operation in detail, and reflect little credit on the parties engaged in drawing up the bill, who, either from actual, or wilful ignorance, would have sacrificed the agricultural, in favour of the ecclesiastical interests. The deduction of 25 per cent. from the usual demand of tithes is purely nominal, and will not affect the clergy, who have been accustomed to this outlay, and even more, in the expenses attendant on the collection of their tithes, and therefore the present bill would secure to them in perpetuity the full extent, and in some instances an increase of their previous income; a measure, one would have imagined, not contemplated by the present ministry; but the truth of which may be illustrated by the fact that not a single petition has been presented on the part of the church against the measure: strong presumptive evidence that there is no just cause of complaint, on the part of the receivers of tithes, however it may militate against the payers.

The supplies of wheat at the port of London during the past month have exceeded those of February by a few hundred quarters, but as speculation in favour of the article again revived towards the close of March, the advanced currencies previously noticed have been further enhanced 1s to 2s per qr. The inclemency of the weather and retarded state of vegetation, has had the effect of exciting an increased

speculative feeling, which at the beginning of the month had become languid. During the first ten days prices receded 2s to 3s per qr, the millers having become the only purchasers, and speculators being unwilling to follow up the advanced quotations; but about the middle of the month the receipt of orders from Ireland, Liverpool, the north and west of England, as well as Scotland, had the effect of encouraging holders to demand higher terms, and which in many instances were acceded to, as the granaried parcels were withdrawn from the market, and the supplies proved inadequate to meet the demand, the general currencies in consequence, towards the close of the month, were rendered 1s to 2s per qr higher than at the similar period of February. The prices also at many of the shipping ports on the eastern coast, maintained fully their top quotations, owing to the transmission of orders from some of the districts for which purchases were being made in the London market, and which communicated a firmness to the prevailing prices in Mark Lane, not likely at present to be shaken, unless a succession of large arrivals should come to land; the advance in the price of wheat from the lowest point of the past year, has however, been considerable; the minimum quotations during 1835 were, the weeks ending the 7th, 14th, and 21st of September, when the top currencies noted were 37s to 38s for Essex, Kent, and Suffolk red wheat, and 42s to 44s for white, and last week for prime red wheat from the same counties, 46s to 48s was obtained, and for white, 52s, 54s, to 56s, and even 57s for extra fine qualities; exhibiting an improvement of 10s per qr on red wheat, and 10s to 12s on white.

At the close of February and commencement of the past month, several orders were transmitted abroad, principally to Danzig, with the view, it is to be imagined, of holding the wheat in granary on the spot, the charges being so much lower, and either realizing a profit by the resale in loco, by those speculators who were early in the market, or as the stocks of the better qualities of bonded wheat are much reduced in England, to be enabled to replace them, on the approach of any demand for the home consumption, as the foreign prices, ruling extremely low, are liable to be materially influenced by the continued advances of our markets, which to foreigners, who have not the advantage of intimate local information, may hold forth the probability of reaction taking place to a greater extent than is at present likely to be experienced. Throughout the month the article has continued to attract attention; at first the inquiries were entirely actuated by the intention of shipment either to the United States of America or New South Wales; but of late some speculative feeling is being directed towards the finer qualities of Danzig, and selected parcels of Lower Baltic red wheats, with the view of retaining them. Prices have, in consequence, advanced 2s to 3s per qr; fine high-mixed Danzig being held at 32s to 35s; Baltic red at 28s; and for inferior sorts 24s to 26s being paid. The exports during the month have been about 2,700 qrs to Sydney, 1,000 qrs to Van Diemen's Land, 400 qrs to Halifax, 1,000 qrs to St. John's, New Brunswick, 2,900 qrs to Quebec, 1,210 qrs to Baltimore, 850 qrs to New York, and 500 qrs to the Mauritius.

The receipts of flour have been 2,695 sacks less than during February. The trade during the first fortnight of March ruled dull, and the top quotations of Town-made qualities were almost nominal; as many of the bakers having been in stock, the demand from the millers was consequently more limited, more particularly as they were reluctant to

comply with the advanced quotations; but, on the other hand, ship qualities were not likely to experience much depression in value, as the prices in London and the neighbouring eastern markets have been lower this season than in the northern and western parts of the country, and as the consumption is carried on in such an extended ratio, owing to the activity prevailing in the manufacturing districts, an accumulation of stock in the millers' hands was not likely to occur; besides Town millers, in some instances, have found it cheaper to purchase ship flour, than manufacture the article themselves. Bonded flour has been in constant demand, but the limited arrivals from abroad and short stocks on hand preventing any extent of business from being transacted, prices have remained firm, and the principal exports, exclusive of some hundred cwts to the West Indies, have comprised about 700 cwts to Van Diemen's Land, 2,000 cwts to Pernambuco, and 800 cwts to the Mauritius.

The advance in the price of wheat throughout England has materially affected the averages, and the duty on wheat has, in consequence, declined 4s per qr, being now 4s 8d. The duties also have receded 1s 6d per qr on Barley, a similar amount on oats and beans, and 4s 6d on rye, peas remaining stationary.

The supplies of barley have been limited, and nearly 10,000 qrs less than the arrivals during February. The demand on the part of distillers, as well as for grinding qualities has been free, and prices have advanced fully 2s per qr. Irish samples participating in the improvement. Malting descriptions have moved more slowly off hand, and though the rates must be noted 1s to 2s higher, yet the trade on the part of Malsters has evinced little animation; fine Chevalier for seed has been in request, and obtained as high as 40s per qr. A considerable diminution has been made in the stock of bonded barley, which at the beginning of March amounted only to 9,801 qrs, since then 1,700 qrs have been entered for export to Oporto, 700 qrs to Lisbon, 500 qrs to Quebec, 210 qrs to New York, and 2,500 qrs to Philadelphia; the general prices paid have been, 13s 6d to 15s per qr. as in quality.

The malt trade in the early part of the month was extremely heavy, and even the best descriptions were with difficulty disposed of, unless at a reduction in price, but the improvement in barley communicated a similar result to malt, and the best samples are fully 1s per qr dearer.

The importations of oats at the close of February, were nearly 30,000 qrs less than during January; in the course of March the receipts have been upwards of 7,000 qrs less than February; and comparing the arrivals of the present season since harvest, with those in 1834-35, there appears a diminution this year altogether of more than 200,000 qrs. The trade has been generally languid, and though the show of samples has continued limited, yet prices have receded, English qualities being fully 6d per qr. lower, and Irish and Scotch, 6d to 1s; and the rates even at this decline have been with difficulty supported, which is in some degree caused by several of the larger consumers having entered into contracts for future delivery, and their wants being covered, they are kept entirely off the market. When, however, the arrivals do increase, it is to be anticipated that they will rather cause an influx of purchasers than influence a further depression in the currencies, as all the buyers who have now so long held back must be bare of stock. In Ireland, though the stocks are unusually large for the season of the year, and in

some instances three-fifths more than held at a similar period of 1835, the Irish markets are scantily supplied, and prices have in consequence further advanced, the accommodation afforded to the smaller farmer by the Agricultural Banks, enabling the farmers still to withhold their grain from market, until they can, it may be supposed, form some estimation as to the probable return of the new crops. Several free-on-board sales have been effected. Oats on the north-west Coast, weighing 41lbs., have obtained 11s 3d to 11s 6d per barrel; at Limerick, 12s; Waterford, 11s 6d to 12s; Wexford, fine, 12s to 12s 4d; Derry, 11s 6d to 12s; in Galway 9s 7d has been paid for unprepared qualities, equal to 10s 6d prepared, without commission. Several small parcels of bonded oats have been exported to the West Indies, besides about 1,000 qrs to Sydney, 1,200 qrs to New York, 500 qrs to Baltimore, and 1,600 qrs to Boston; stale Russian have been sold as low as 9s, but Danish, Swedish, &c., in good condition, have obtained 11s to 12s, and Friesland 12s to 14s, fine brew being worth 15s.

The sale of beans has been rather heavy, and prices have receded about 1s per qr, but the article became firm at this decline towards the close of the month.

The demand for white peas has much increased, in consequence of the article being taken for the feeding of lambs, and prices of the best descriptions have advanced 3s to 4s per qr, and the stocks extremely limited. Grey and maple have also improved 1s per qr.

During the month of March the following quantities of grain and flour have arrived in the port of London:—

	Wheat. qrs.	Barley. qrs.	Malt. qrs.	Oats. qrs.

In France the prices of wheat remain extremely firm, particularly of the finer descriptions, as the millers are complaining of the quality and weight of many of the stacked wheats, a circumstance, which is attributed to the want of straw at the commencement of the harvest to thatch the ricks, by which means the grain became exposed to the rains which set in the early part of September; prices also of rye and oats are steady. Wheat continues to meet demand for shipment to the southern ports, where the currencies, comparatively, are ranging high; at Marseille, wheats from Normandy are realising 4s to 4s 3s; lower Loire qualities 4s 6s to 4s 8s; at Lyon 3s 8s 2d to 4s 1s 7d; at Toulouse, the best descriptions obtain 4s 3s 10d to 4s 7s; at Bordeaux, 4s 5d to 4s 6s, and at Paris the range of quotations is from 2s 8d to 3s 6s; and though the unfavourable reports respecting the crops, appear to have been

premature, the rains having proved beneficial in softening the ground, and in invigorating, and giving new life to the plants, yet should it ultimately turn out, that they had sustained any material injury from the severity of the cold, a considerable rise in the markets must ensue, as the exhaustion of the stocks in some departments requiring extensive supplies from others, is having the effect of more than equalizing the surplus quantities in more favoured districts, and causing generally the supply to become limited, requisite to meet the current demand. The wet is impeding the sowing of summer grain, and the next harvest is therefore likely to be protracted. The rape plant is reported to have suffered serious injury from the alternate thaws and frosts, and in some places the plant has in consequence totally failed. Linseed has also been injured from similar causes. At Marseille bonded wheats were more inquired after, and higher prices realized, it being rumoured that the foreign wheat in store was about to be freighted in French vessels to the more northern departments, where the duties, owing to the high range of averages, were much lower, say three francs, 37 centimes per hectolitre, and would be there entered for the consumption, as the duties in France, though operated upon by the averages as in England, vary in their amount, according to the range of certain specified departments, the kingdom being divided into four classes, and the duties of each class being regulated by a different maximum price.

In the Italian and Mediterranean markets little variation had been experienced in the demand or currencies: at Naples reports were circulated that the appearance of the crops of wheat in Puglia were unfavourable, and Barletta wheat on delivery was held at 22s. 4d per qr. The Neapolitan government had also remonstrated with France on the late legislative enactment, prohibiting the manufacture of bonded Barletta wheat into flour for export to the colonies. At Leghorn the business had been rather extensive in wheat, for the consumptive demand; white Tuscan qualities being noted at 45s 2d, and red at 39s 6d; Odessa 28s 3d to 32s. Roman beans 26s 6d; New Egyptian 20s 7d per qr. At Trieste the demand for grain being confined to the local wants, prices had sustained little variation, Italian, Banato, and Odessa wheat being quoted at 25s 7d to 30s 10d.

In the Black Sea prices of wheat have improved; and at Odessa, wheat was held at 20s 4d to 24s 3d, for the finest samples of hard; but for delivery in May and June, when the supplies from the interior would be coming to hand, the article could be obtained at 18s 6d with all the money advanced.

From New South Wales the advices at the commencement of the month continued unfavourable, from the causes specified in our last review, and prices still advanced, quotations being noted at 14s to 16s per bushel, and extra fine as high as 20s, and flour 42s per 100lbs: these tempting prices induced speculators in this country to persevere in their shipments, not bearing in mind that the consumptive demand of Sydney and neighbourhood was comparatively limited, and that the shipments already effected from this country would in all probability force the prices to a much lower range, exclusive of the wheat and flour which would be shipped from the East Indies and other ports, the voyage from whence was considerably shorter than from England. At the close of the month advices have been received dated the 14th November, which, as we anticipated, note a material decline in the currencies, occasioned by rains, supplies, and holders

bringing forward part of their stocks. Wheat was not realizing more than 6s to 9s per bushel, and very superior in small quantities, 9s 6d, but oats were still ranging high, say 5s 6d to 6s per bushel. In Van Diemen's Land wheat was held at 8s to 9s per bushel; flour, 27s to 30s per 100lbs; oats, 4s 3d to 4s 6d per bushel.

In Canada little alteration has occurred in either price or demand of wheat and flour; the former article was firm at 5s to 5s 6d per minot for lower Canada red; inferior 3s 2d; superfine flour, 32s 6d; fine 30s per barrel.

The grain and flour market in the United States of America, has experienced a further improvement in price; at New York, the best brands of Western Canal were held at 35s 6d per barrel, being fully 1s 6d per barrel dearer than our last report. Several arrivals of wheat had arrived from England, and a few from Holland, and by the last advices, dated the 2d of March, there were about 35,000 bushels of European wheat afloat; but the severity of the weather had been so intense, that the usual communication with the mills in the vicinity was interrupted, and no sales had been reported; the last quotation given was that of Western wheat at 45s 10d to 47s 8d. About 4,000 bushels of barley had been received from London, which remained unsold. Rye on delivery was selling at 36s 8d. Ryemeal scarce at 24s 9d per barrel. At Philadelphia some supplies of European wheat had been received and obtained remunerating prices. Samples of native growth were in very short supply, and had obtained 55s. At Baltimore wheat was firm, and the top quotation 53s 2d. Howard Street flour 30s 11d. Cloverseed generally dull, and declining in value at all the leading markets.

The quotations of Linseed in the Russian markets remain unaltered, and as the prices of Kubanka and Courland Wheat range too high to attract any speculative attention in England, the grain trade at present in this part of the world possesses little interest; Kubanka quality is noted at 31s 4d to 32s 8d, and Courland at 28s per qr. At Riga, Linseed had been in request, and best crushing qualities realized 42s 4d, but the demand had abated; middling descriptions had obtained 39s 11d to 40s 1d. At St. Petersburg, Morschansky samples deliverable in July and August, had brought 42s 9d, and a few parcels on hand in granary as high 47s 4d; good machined seed was offering at 40s 5d, and some had been purchased at 40s 1d. At Danzig the improvement in the English Wheat trade had communicated some degree of animation and spirit to the market, and holders were demanding 32s, 33s, 34s, and even 35s per qr. for the top qualities, which are comparatively very scarce. Purchasers, however, have refrained from acceding to these terms, even for limited parcels, fearful by these means to establish a high range of currency; the highest price paid was 31s to 32s for a few hundred quarters of fine, though 27s to 29s has been given for good and high mixed samples.

In Mecklenburg, prices of Wheat have advanced, and best samples not to be obtained under 23s to 24s per qr. at Rostock, owing to the demand for shipment principally to England, Jersey, &c. In Holstein nearly the same rates were being obtained, owing to the improved currencies in England and shipments to the United States. At Copenhagen, holders of wheat were firm at 22s 6d. The trade at Hamburg for the finer qualities of Upper Elbe wheat was steady, purchases being made for the consumption, for grinding and for export to America, Portugal, &c.; but the inferior qualities were difficult of

disposal. Marks, Magdeburg, and Saale wheats sold at 23s 3d to 25s. Beans dull, and in peas little doing. Rapeseed was held at 31l 10s to 32l per last.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on both sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

### TITHE COMMUTATION BILL.

(From the Morning Chronicle.)

Although we remain sensible of the necessity of effecting a permanent commutation of tithes, we have with reluctance arrived at the conclusion that the compulsory clauses of Lord John Russell's bill cannot be brought into operation in their present shape, without great injustice to the owners and occupiers of land, and great mischief, direct and indirect, to the community.

Under the bill, tithes are to be commuted for a perpetual rent-charge, secured by powers of distress and entry and perception of profits (of which a word by-and-by,) and the principle of the compulsory clauses is, that the amount of the rent-charge which is to be paid henceforth and for ever on each particular farm or field, is to be determined by the net value of the land—not even by its capability, if it may be so termed, of yielding gross produce—not even by the actual gross produce during any long period of time; but by the amount of the gross produce which, during the short period of seven years, in pasture or in tillage cultivation, under good husbandry or bad husbandry, great expenditure or little expenditure, and all the accidents of cultivation or cropping the land to be charged may have happened to yield; and the tithe-owner may compel a rent to be so fixed on any land he may choose.

If a landlord, therefore, during the last seven years, happens to have been cursed with a good tenant (for a curse the bill makes him,) or if, being himself an occupier, he has been afflicted with industry and capital, or, still more, with the mania of improvement, his gross produce will have been high in proportion to the gross produce of his neighbour's farm. He may not, it is true, have received profit in proportion to his expenditure or to his gross returns; but this accident, to which many ingenious cultivators are liable, will not excuse him. The parson is to be invited to pounce on him, and our improver and his heirs are to be punished in perpetuity for the offence of having grown two ears of corn where one grew before. He is to be made subject to a perpetual rent-charge, higher than his indolent neighbour's, nicely adjusted in proportion to the superior productiveness of his farming.

A penal rent, an increased or new rent to be payable on account of specified acts of waste or bad husbandry, are familiar to those who are acquainted with leases. Lawyers are generally considerate enough to limit the term of this penalty by the continuance of the offence, and even the charge of tithes now continues only so long as the productiveness of

the capital expended remains unexhausted. But the mercy of the legislature is to allow the parson to charge with a penal rent in perpetuity any landlord who by himself or his tenant is caught in the fact of productive cultivation.

The working of the principle in its effect on the industrious, as compared with the negligent cultivator, is objectionable and repulsive enough, and would alone, when the measure began to be felt, excite great and just complaint. But the more general and all pervading objection to the principle is the heavy perpetual charge which it fixes on that land which happens, during the last seven years, to have been under the plough, as compared with that which, during the same time, has been in pasture. We have before us an estimate of the value of the gross produce (one year with another) of a farm in one of the eastern counties, about one-third being meadow and pasture, and two-thirds under tillage, in what is called the four shift husbandry. As we know that the estimate was formed by an experienced man, and without any reference to such a catastrophe as the compulsory clauses would bring upon tillage farms, we prefer it as an illustration of the working of the bill to any supposed cases.

Estimate of the produce of a farm of 155½ acres in:—

25 acres in wheat, at 7 combs (3½ qrs.)			
per acre, at 25s .....	£245	0	0
24 do. barley, 10 combs per acre, at			
16s .....	194	0	0
25 do. turnips, &c .....	175	0	0*
25 do. clover .....	100	0	0

Gross produce of 99 acres arable £714 0 0

44½ meadow and pasture .....	89	0	0
12 rough pasture .....	18	0	0

155½

Gross produce of 56½ acres of meadow and pasture.....£107 0 0

It will be seen that the value of the gross produce of the arable land is about 714s per acre, the value of the gross produce of the meadow and pasture is about 117s per acre, though the land under the plough and that not under the plough are, as nearly as may be, of the same quality, and would yield about the

\* We confess this appears too high. But any reasonable deduction from this item will not materially affect the conclusion, and in many arable districts the bean crops substituted for turnips are very productive.

same rent. The gross tithe, after making a reduction of 25 per cent. according to clause 29 of the bill, would be represented by a perpetual rent-charge of 10s 9d per acre on the arable, and about 2s 9d per acre on the pasture (subject to a variation common to both rents according to the average prices of corn.) The difference between the charge on the different lands of the farm is, of course, of no consequence; but when we consider that different classes of landowners in England are represented by the 99 acres which are to be charged in perpetuity at 10s 9d, and the 50½ acres which are to be charged at 2s 9d, how intolerable will the injustice appear? Although the owner of the 99 acres may now pay a tithe equal to the amount of the threatened rent-charge, yet, when it suits his altered circumstances, or the altered circumstances of the country, that his land be laid into grass, he escapes the heavy burden. But when he has once become subject to a perpetual rent-charge, this escape is not open to him. He may, indeed, as before, lay his land under grass, but he will be subject to a rent three or four times as high as that charged on grass land of similar quality.

His misfortunes will not end here. Those who have had farms under pasture (the owners of the 50½ acres,) not having any longer the fear of tithe in kind before their eyes, will be enabled, by breaking up their lands, to come into competition with the owners of the land already under tillage. The latter will be crushed not only by their own burden, but by their not crowding the market of their more lightly burdened neighbours.

We have not sought for or stated an extreme case. In many places tracts of down land or poor pasture have been broken up, which it is now generally considered that it would have been good policy never to have disturbed, and which, wherever it is possible ought again to be returned to their former state. In these cases the tithe taken in kind is often not less than the rent, and the rent-charge fixed on such lands caught under cultivation, will make the parson the landlord.

Let us suppose a rent-charge of 7s or even 5s an acre fixed on the poor land on the top of the chalk hills, which at great expense is continued under cultivation, and which in many parishes even within thirty miles of London scarcely yields a rent. What possibility would there be under a continued reduction of the price of grain of continuing them under tillage? They must perforce be allowed to fall into a state of nature. But the rent-charge remains in unabated vigour, and with it the *trinidad necessitas* of the Bill, the powers of distress, entry, and perception of profits.

The first remedy which the tithe owner will resort to is distress; and as everything moveable will soon be exhausted, the power of entry will be brought into immediate operation, and the tithe owner is to take "the rents and profits to his own use until he shall be fully paid and satisfied the said rent-charge and all arrears thereof due at the time of such entry or during the time of his being in possession or in receipt of the rents." It is quite certain that under this provision large tracts of such poor land as we have mentioned must fall into the actual possession of the parson; who, as he has no temptation to improve it, must continue in possession so long as the patience of the country will allow. The Bill, indeed, in its mercy exempts the person of the landlord from any charge. But even this will be, in many cases, scarcely a benefit; for as few landlords are exempt from some other charge, when the land has been taken by the tithe-owner, the person of the landlord will be impounded by the mortgagee, until he shall walk

out under the Insolvent Act "as free as nature first made man," a striking example of the perfection of agricultural relief.

There is one other case (if it be worth while to enter into particular illustrations of the general effect of the measure) of very striking hardship. In many parishes, in the pauperised counties, there has been a forced cultivation during the last seven years under *labour rates*—an increased quantity of labour being employed, not for profit, or in expectation of profit, but for the temporary purpose of keeping a surplus population out of mischief, and (wisely or unwisely) under the sanction of an Act of Parliament. The employment of surplus labour of course increased the gross though it diminished the *net* returns. On this increase the Bill will attack; and the landowner will for ever pay an increased tithe-rent to the parson, on account of efforts (stimulated by the Legislature) to lighten the burdens of pauperism.

The injustice of the principle is acknowledged by the Bill itself, in the case of hops—for it appears to have become evident to the framers of the Bill, that it would be monstrous to allow a hop tithe-rent to be levied on lands after they had been returned to the plough or to pasture. But the difference between the operation of the Bill on hop land (had it not been specially provided for) and arable land, is in degree only; nor is the difference even in degree between the least expensive hop lands and the most expensive kinds of tillage so great as might be at first sight imagined. Between the hop grounds and many market gardens there is practically no difference even in degree, though even market gardens are not excepted in the Bill. On the case of these gardens we do not, however, dwell: for we feel convinced that the dullest sense of justice must be roused by the mere statement of the gardeners around London of the hardship of their case, and that they must be excepted in the same manner as the hop planters.

We must say a word of the effect on what is called "agricultural distress;" in which we do not include the case of the landlords we have described, who, being relieved of their estates, will be effectually discharged from all cares connected with agriculture.

The forced commutation effected in the manner proposed, odious to the landlord, will be followed by a louder and juster cry of agricultural distress than we have yet heard.

We have often dwelt on the fact, and it now begins to be acknowledged, that a great part of the distress of the anciently cultivated parts of England arises from the increased competition, through increased facilities of communication, of the more remote and more lightly burdened districts of the kingdom. The heavily burdened districts of the east and south of England will, after having been saddled with a new and perpetual charge, be exposed to the new class of competitors whom we have described—the owners of pasture lands of the remote counties, who will turn themselves to the supply of grain for the London market. The change of the course of tillage or industry, even when occasioned by the natural progress of society, and drawing with it an improvement in the quantity and quality of produce, is attended, like other changes, with much local inconvenience and suffering; but changes arising from the artificial inequalities of burdens, produce the inconvenience and suffering without the ample compensation of a public benefit.

We have exceeded our space. But what, too, must be the effect of the proposed system on the hopes of any relief from the Corn Laws? The pro-

spect held out to the landlord on a free admission of foreign corn, is a conversion of the land to pasture. But how can the legislature hold out to him this prospect of relief to the owner of arable land, when he is charged with a perpetual rent only tolerable so long as the present extent of tillage land suffers no diminution?

We entreat, therefore, the Ministers to pause before they press forward such a Bill, under which the only hope left for the owner and occupier would be, that the tithewoman would in his kindness forbear to use the powers which the Legislature should be absurd enough to grant.

## THE STATE OF AGRICULTURE.

(From the *Life Herald*)

We have much pleasure in referring our readers to a report of the proceedings of the half-yearly meeting of the Kirkcaldy Agricultural Association. The speeches which were delivered, it will be seen, are very far from being of the ordinary jejune description, and contain a great deal of good sense, founded on just and tolerably comprehensive views of the present position and future prospects of the profession of agriculture in this country. It is an old saying, that the knowledge of a disease is half the cure; and we have not the smallest doubt but that, when once the great body of our agriculturists shall have come to see clearly the nature of the evils which unfortunately beset their path, a very considerable progress, indeed, will have been made towards their removal. It seems abundantly evident that there are but three ways by which farmers can possibly escape from their present difficulties; either they must augment their produce through the medium of a more skilful mode of husbandry—obtain better prices for it when brought to market, or force their landlords to entertain less extravagant notions on the subject of rent. It behooves the farmer, then, not only to consider well what there is a reasonable prospect of effecting in each of these ways for his immediate advantage, but what are the great principles under the all-controlling power of circumstances which determine these points, in order that, as much as possible he may be possessed of data to regulate him in entering upon future engagements. As to the benefits derivable from improved culture, it is scarcely necessary to do more than simply allude to them. They have proved of great moment, and, no doubt, will continue to do so; they constitute a species of advantage appreciated and reckoned upon by every body. There is this peculiarity, however, attendant upon the gains arising to agriculturists from the introduction of superior plans of cultivation, that by augmenting the produce of the country, they directly tend to lower its market value; and, in this, we have an example of that community of welfare which not unfrequently, under the wisely arranged operation of natural causes, binds together the interests of the various classes of society. It is thus that with every improvement that takes place, whether in agriculture, machinery, or any thing else, the gain is not limited to the immediate agent, but ultimately flows onwards in order to augment the happiness of the community at large. The second channel by which at first sight it may be considered possible for agriculturists to escape from their present embarrassments, has reference to a general rise, independent of temporary or fluctuating causes in the market price of farm produce. But how is this to be obtained? By no other means certainly than through an increase of commercial prosperity. Any such wild project as another action on the circulating medium of the country, we

should think, must now be generally abandoned as at least impracticable; and, if so, it is clear that there is no other possible method by which prices of any sort can be raised and upheld, than either by diminishing the production of the article or by augmenting its consumption. Any attempt to diminish the amount of agricultural produce, however, by stepping backwards to an inferior mode of cultivation, would, generally speaking, be but making bad worse, and is a mode of procedure that would only be resorted to under the pressure of the most adverse circumstances. Barring bad harvests and deficient crops then, it is to an extension of our manufactures and commerce, which the agriculturalist must look as the real source from which an improved state of the market is to take its rise. With a thriving trade the power of consumption of agricultural produce on the part of society rapidly extends itself; and, under such circumstances, however quick may be the rate of agricultural improvement, there is much less risk that the increase of population will fall behind, than unduly stretch itself beyond, the proportionate stage of advancement. Here, we again see the identity of interest which obtains between commerce and agriculture. If agriculture, is the back bone of our national prosperity, it is commerce, which supplies the hands and the feet, the muscles and the nerves, which impart to it motion and vitality. Admitting this identity of interest then, between agriculture and commerce—which shows that there is in reality no such thing as sectional interests in the country—that under a proper system of government there is not a separate interest for agriculture and a separate interest for commerce, as the Tories would have us believe, but that the whole becomes merged into one general interest—the national interest,—the question immediately arises, what is the course of policy most promotive of this common interest? Now, this question has been settled long ago. Since the days of Adam Smith, only one answer with any show of reason has been given to it, and that is, that all trammels and fetters imposed by government upon trade are essentially pernicious. But trammels and fetters, notwithstanding, have constituted a most prominent feature of our national policy, and even yet the wheels of commerce continue bound down at the instance of agricultural cupidity. We trust that the farmers of *Life* will at length permit themselves to look dispassionately upon this great question in its true light. What interest has the farmer in retarding the well-being of the nation, by lending his aid in upholding such a monstrous cheat upon the general interests of the community as the iniquitous Corn-laws? Is it imagined that restraints upon commerce will lessen the competition for farms? The fact is, every other means except an increase of commercial prosperity which can be thought of for such a purpose must necessarily prove abortive. Farms cannot be multiplied like living beings; and, unless those branches of industry which admit of almost unlimited expansion are allowed the freest development, so as to provide the means of profitable employment for the rising generation there cannot be the smallest doubt, whatever may be said on the subject of landlords fixing their rents and choosing their tenants, that rack-rents will be the rule, and that leases upon Mr. Ainslie's principle of "thriving and growing rich" will continue the rare—the very rare exception. We now come, in the last place, to the topic of rent. However desirable grain-rents may be, and their adoption ought by all means to be encouraged, still they will be found to fall greatly short of the removal of the evil, which nothing but a great increase of national prosperity, in order to the draw-

ing off from agriculture the surplus competitors for farms, can effectually remove. But there is no partial remedy more immediately at hand than the abolition of the Corn-laws, or, at least, the imposition of a fixed in place of the present complicated system of fluctuating duties, which can be of service to the farmer? Yes, there is one law which operates most ruinously against the agricultural profession in favour of the personal interests of the landlord, and which ought immediately to be abolished—we mean the law of hypothec. It is through the unjust preference which the landlord possesses over other creditors in consequence of it, that he is mainly enabled to screw up the tenant to the last farthing. Deprive him of this instrument of power, and the profits of capital employed in agriculture will soon rise to the level of the general rate of profit of the country.

### THE DOVER RAILROAD.

(From the Maidstone Gazette.)

Let us first examine its probable effects on Maidstone, locally. If any munificent person were to appropriate a large yearly sum for ever, to defraying half the expense of carriage of all the goods that passed between London and Maidstone, he would be viewed as the greatest benefactor that this or any other county had ever known, and very probably a marble monument would be raised to his honour in some conspicuous part of Maidstone. We believe that the advantages, that are now offered by this railroad, are at least adequate to such a boon, and we hope that before our readers have risen from the perusal of these remarks, they will concur in that opinion. It is not necessary for us to say more about the south-eastern railroad, on the advantages of which an able letter will be found elsewhere, than that it will be ruinous to the prosperity of Maidstone. Nobody can blame the inhabitants of the Weald, who have as great a right to improve their position as the people of Maidstone,—but we hope to be able to prove that the inhabitants of the Weald will be almost as much benefited through Maidstone, by the Gravesend line, as by their own, and that too without injuring Maidstone. It is not improbable that Maidstone will become the hop-mart of the kingdom, where from the facility of getting hops to London at a short notice, the whole produce of the county will be warehoused, instead of being kept in the high-rented warehouses of Southwark. In that case it would become the residence of many hop-merchants, who would have the advantages of purchasing at the first hand, of founding their speculations on the progress of the growth, and of enjoying a delightful country residence, almost within reach of their offices in Southwark. Nobody will contend that an increase of respectable residents will not be beneficial to Maidstone. They may have some of their shop-goods from London, but it is very improbable that they will employ London butchers, bakers, carpenters, &c. The visitors who leave London for a day's recreation, and now resort to Greenwich, would infinitely prefer a gypsy party to the Boxley Hills, and the name of our old friend Kit's Coty would be as familiar in the mouths of young cockneys, as "run-tree-hill" and the "hob-serivatory." Let us now inquire into its effects on the farmers along the line. The case of the farmers has been so ably discussed by the correspondent of a Gravesend paper, that we make no scruple to extract it.

"It is a curious fact, that in almost every instance farmers are peculiarly alive to supposed injuries which

railways may inflict on them, whilst few are proportionably acute in discovering the benefits that must infallibly arise from them. For instance, close to London the market gardeners and dairy men exclaim that the railway will bring milk and vegetables from a distance of twenty miles as early as he can send them five. This is no doubt the fact; but the farmer twenty miles off, instead of looking to the advantage he would thereby attain, immediately cries out, that he supplies London with butter, and calves, and lambs, and that the railway will bring them up sixty or seventy miles as easily as he could send them twenty. Then at sixty or seventy miles from London, the farmer perhaps will tell you that he is a breeder of horses, or supplies stage-coach masters with oats and beans, and that as the railway will put down the stage coaches, he shall find no market for his produce. Now the truth is, that though each and every of these persons may be to a certain extent right, in the particular apprehension which he entertains, still there is no one injury which the railway inflicts, for which it does not provide more than an equivalent. They who have most cause to complain are the occupiers of land immediately round London, because at present they enjoy from their position a lucrative monopoly. The land which is let as dairy land round London is known to fetch a most enormous rent, and the business of a suburban cow-keeper is also well known to be more profitable than that of a country farmer. If, therefore, the railway places the farmers fifteen to thirty miles from London, in a condition to compete successfully in the supply of milk with the cow-keeper in the immediate neighbourhood of London, can it be doubted that the value of his land will be increased, and his own condition bettered by turning cow-keeper instead of suckling calves, and rearing lambs? That the railway will place him in that position must be admitted, because twenty miles will be traversed by it as quickly as five by a cart on the common roads, and moreover the motion of a railway carriage is so easy that the milk and cream will not suffer from jolting which might injure it in so long a journey."

The writer might have added that the oats and beans may be applied to the fattening of bullocks, instead of the feeding of horses. The advantage of being able to procure gypsum, bone-dust, and other species of manure, (particularly salt from Bristol and Droitwich, which will probably in a few years supersede every other manure,) and of being able to send agricultural produce, beasts, sheep, &c., to market, from some parts of the country which are now almost inaccessible in winter,—will be incalculable and will of course proportionably raise the value of the land, and benefit the cultivator.

### SOAP AND TALLOW DUTIES.

Extract from the Debate upon Mr. Handley's Motion on the 15th of March.

Mr. HANDLEY then moved a resolution to the effect that it was expedient to repeal the excise duty on soap and to augment the custom duties on foreign tallow. He said he could not act upon the suggestion of the right hon. gentleman, and the reason why he could not was, because the disposal of so large a portion of revenue would not meet with the approbation of those whom he represented. The parties in whose behalf he now appeared, were unfortunately too often excluded from the financial operations of the Chancellor of the Exchequer, from whatever side of the House he might come. (*A laugh.*) His Majesty in his gracious speech from the throne, called on the House to direct a special inquiry into whatever measures might alleviate the distress of the agricultural districts. The existence of

great agricultural distress was well known, and its character was not mitigated up to last year. He believed that the manufacturers and operatives had come to the opinion that prices might be too low when accompanied by the distress of the agricultural classes. From 1810 to 1820 the average price of tallow was 73s per cwt; from 1820 to 1830 it had fallen to 42s. Independent of having to contend with a low duty on tallow, and a large foreign supply, the soap-manufacturer, who was perhaps their best customer, had to contend against a system of excise which nothing but necessity would justify. What would be thought of that system which debarred manufacturers from availing themselves of the improvements which chemical research and discovery presented to them? The soap-manufacturers had long been restricted from making use of such discoveries: they were even now subject to the same restrictions as were imposed in the reign of Queen Anne. And what was the result? There was smuggling to a great extent. Owing to there being no duty in Ireland, the smuggling from that country was considerable; the home manufacturer was unable to compete with the foreign producer; and there was no export trade. He should now refer to the report of the Excise Commissioners as to this subject; but before he opened that Pandora box, he would mention that the first recommendation of the commissioners was, that the duty should be extended to Ireland, and the regulations be the same in both countries. He congratulated the hon. and learned gentleman for Dublin that even-handed justice was about, at length, to be dealt out to the sister kingdom. (*Laughter and Opposition cheers.*) He trusted that he should have the hon. and learned gentleman's support. Either the hon. and learned gentleman must vote for his motion, this night, or he must submit to see his fair land trodden by a formidable phalanx of soap-duty-collecting excisemen. (*A laugh.*) He supposed he was upon this occasion to be opposed by the right hon. the President of the Board of Trade, whom he observed taking notes; but it was to be remembered that that right hon. gentleman had proposed taking the duty off printed calicoes and putting it on cotton. In opposition to what he had heard proposed, he was conscious that it might no doubt be said, that it would be found a great inconvenience to Russia if they imposed a greater duty upon tallow than what there was at this moment upon the article: that in fact Russia would not like to see a greater duty imposed. Now he would say that, so far as Russia was concerned, we took three times the amount of value from Russia that she took from us. (*Hear, hear.*) Russia imposed a duty of 12½ per cent. upon all our goods, and excluded altogether our refined sugars. (*Hear, hear, hear.*) It seemed from the discussion of the other evening that nothing was to be done with regard to the spirit licences, and that evening they found the right hon. the Chancellor of the Exchequer had bespoken a large portion of the revenue. He very much doubted that so large a portion was allocated in a manner quite congenial to the feelings of the moral population of the country. (*Hear, and cheers from the Opposition.*) Unquestionably what had been proposed that evening, did not appear to him to be of much benefit to those solely interested in the land, nor to bear out the recommendations which had been made upon this subject by their gracious Sovereign; nor could he see how it was calculated to meet any recommendation of the agricultural committee, when, at a later period of the present session, it should suggest for the agriculturists any particular mode of relief. (*Hear.*) They would have other disadvantages still to contend against—their position would be still worse, unless there was from that House a strong recommendation to the right hon. the Chancellor of the Exchequer to take this subject into consideration. The tax now, with costs of collection, was 600,000*l.* By imposing upon Russian tallow a duty of 10*l.* a ton, they would be able to raise 320,000*l.* leaving 280,000*l.* to come out of the surplus. He was aware that what he proposed was calculated to raise the price of candles. That was the difficulty in this case, and the only one, he believed, against which he had to contend. A penny a pound had been taken off candles recently, and the amount of the duty that

would now be imposed would not be the half of that; but seeing that candles and soap were consumed by the same persons, and the diminution in soap being four times as great as the amount that would be imposed upon candles, the public must therefore be greatly benefited by the bargain. He should now conclude by moving, in the terms of his motion, "That it is expedient to repeal the excise duty on soap, and to augment the customs' duties on foreign tallow." After the motion had been read from the chair, the hon. member changed it for one to the effect, that the House should resolve itself into a committee upon customs and excise, for the purpose of considering the propriety of lowering the duty on soap, and augmenting the customs' duty on foreign tallow.—Mr. HALFORD seconded the motion, and in doing so declared that the clear and lucid manner in which the hon. gentleman had submitted his motion to the House, rendered it unnecessary for him to say more than a very few words in supporting it. The proposal of the hon. gentleman, in his opinion, was calculated to benefit the agricultural interests, and not only their interests, but, in his opinion, that of every other class of the community. He knew very well that they would hear of the impolicy of imposing a tax upon the raw material. He took such an argument as rather serving to show that, under the present circumstances, if they were to admit foreign articles of common necessity to the home producer, there was also a scale of duties which afforded no protection to the British producers, and robbed them of that fair remuneration to which they were entitled. It was his opinion that free trade and political economy did not apply to such a subject as this. He had no doubt that the small increase of duty which was now sought for on the foreign article would increase the value of land about 30s per acre—there would be an advance in the price to that amount. He would say for himself that he was bound up with the manufacturing interest, and was the representative of a manufacturing as well as an agricultural district. It was clear that any injury done to the manufacturers would immediately be recoiled upon the land. In the district that he represented this was felt to be the case. Leicestershire was a county in which the manufacturers exceeded the agriculturists—there 139,303*l.* 6s was levied in one year for poor and county rates, and in that contribution paid by mills and factories liable to the assessments was but 783*l.* The cost of a candle, which gave light in the cottage of a Leicestershire weaver, was to be deducted from his scanty earnings. Such an individual would feel the increased cost; but the proposal of his hon. friend comprised a reduction in an article which was equally necessary. That proposal he rejoiced in as of great importance, and he was prepared to give it his unqualified support. On the financial part of the subject he had very little to say, but if he were competent to do so, he should ask them whether they would choose between cheap newspapers and cheap soap?—which was most conducive to the comfort of the labouring part of the community? (*Hear, and cheers from the Opposition.*)—Mr. POULLETT THOMSON stated, that it was not upon the relative merits of his hon. friend's proposition, as compared with the repeal of the tax upon newspapers, that he should wish to argue this question (*hear, and cheers from the Opposition*); but he was prepared to argue this question upon the simple proposition of his hon. friend, and to say, that if the revenue were in a condition to spare the amount which his hon. friend proposed to claim, this was not the mode in which he should be inclined to appropriate it; because he believed that the proposition of his hon. friend would not be conducive either to the general advantage of the country, or to the particular advantage of a class whose interests he advocated; and because, above all, he was satisfied that it was entirely opposed to the whole course of legislation which had been followed up for years by successive governments, beginning with the government in 1820 under Lord Liverpool; by the government of the Duke of Wellington; by the government of Lord Grey; by the government of the right hon. gentleman opposite, and by the government at present existing. (*Hear, hear.*) He did not believe that the proposition

of his hon. friend had been correctly stated as to its bearings by him. His hon. friend, so far as he understood him, proposed to transfer the duty to this extent; he wished to get rid of the excise duty, and he proposed to make up for the loss of this duty, by the imposition of a fresh tax; that was a duty of 10*l* per ton. His hon. friend stated as the result, a loss of 250,000*l* to the revenue; and as he understood his hon. friend, the gain to the consumer would be 300,000*l*. Now, if the House would indulge him for a few minutes, he would, from his calculations, undertake to show that the consumer would not be benefited, that the landed proprietor would not be benefited, and that the country generally would lose a great deal. (*Hear, hear.*) The consumption of tallow in this country was 155,000 tons; of these 55,000 tons were foreign tallow which were imported, and there were 100,000 tons home produce. Take then the revenue on the plan of his hon. friend, supposing his plan to be carried into effect, and that 55,000 tons was the quantity at present imported; suppose that so much should continue to be imported (and he was prepared to show afterwards that such would not be the case), but supposing the same quantity should still come into the home market the duty upon that would be 550,000*l*. From that they should deduct the amount of the duty at present imposed, 171,000*l*, and there remained then the sum of 379,000*l*, as to probable revenue. His hon. friend has proposed the repeal of the soap duty, which he said was about 600,000*l*. That was the duty in 1834; but the net amount of the duty, deducting the drawback, was 736,000*l*. His hon. friend had added a charge for collection; but they all knew from experience that where the excise existed for certain purposes, the reduction of officers would be nothing like the large amount or equal to the difference which his hon. friend had stated. (*Hear.*) Deducting then 379,000*l* from 736,000*l*, the loss to the revenue would be 355,000*l* according to his hon. friend's plan. But according to that statement he supposed that there would be no falling off in the import of the article; but he was not right in assuming that; on the contrary, the natural result would be of imposing where there was 3*l* a ton duty, an additional 7*l* a ton, adding to the price of the article 20 per cent. There was every reason for calculating, when that was done, that there would be a falling off of 15,000 or 20,000 tons. That would reduce the revenue still further—it would increase the loss of the revenue, as stated by his hon. friend, 250,000*l*; but by him 350,000*l*. This was to be regarded as a question of revenue—and as a loss to the revenue of such a sum they had to look to it. But he now came to another part of the argument of his hon. friend, namely, the gain to the consumer, which had been stated at 300,000*l*. His hon. friend had admitted, indeed, that some disadvantage would perhaps arise from the increased price of candles. That increased sum was to be paid by the consumer; and there was also an increased sum to be paid by those using machinery. But really his hon. friend had passed by this part of the subject, as if it were of very little importance. That such a course should be taken by his hon. friend greatly astonished him. (*Hear, hear.*) There were 200,000 tons of home tallow, and of foreign 55,000 tons. How then did they come into consumption? According to facts and calculations which could be made, it appeared that the amount of tallow consumed in soap was 25,000 tons. He could give his hon. friend the calculations, and he would find that the total amount of soap charged was 67,000 tons. It was calculated that there was about 11 cwt. of tallow to a ton of soap. There were, then, 96,000 tons of tallow for the consumption of soap. What was the quantity used in machinery? Possibly 15,0 tons; and thus they had one hundred and thirty thousand tons of tallow on which his hon. friend proposed an additional tax, and 25,000 tons from which he proposed to take off the duty. (*Hear, hear.*) He had made this calculation, and he supposed that the 130,000 tons, on which his hon. friend proposed to increase the duty by the amount of 6*l* 16*s* (the present duty being 3*l* 4*s* added to it, would make it 10*l* the ton), that would amount to 884,000*l*. He added, of course to this sum, the 25,000 tons used on soap, the amount on which

would be 170,000*l*, that would make a total of 1,024,000*l* according to his estimate; therefore, if they took 736,000*l* from the 1,024,000*l*, they would have the remaining sum lost. There would be this loss instead of the gain to the consumer. (*Hear, hear.*) The only mode proposed for securing the revenue was by raising the amount of duty 6*l* 16*s* a ton, that was supposing the amount imported as at present should continue; it was the only mode by which they could secure the revenue. But when the duty was raised so much a ton, and the impost was found to fail, they would be obliged to go as high as 20*l* a ton to have any chance of saving the revenue from loss. His hon. friend had said, that according to their own principles he could show that they had acted in a manner similar to what he now proposed, and gave as an instance the article of wax. His hon. friend, with his acuteness, should have seen the difference between the two subjects. It has been said "there is a river at Macedon and a river in Monmouth," and there was no more analogy between the two questions, than between those two points. There was but a small quantity of foreign wax imported; and when the excise duty upon candles was wholly repealed, it was not considered advisable to continue all the labour, trouble, and vexation of inspecting the import of such articles for a duty which was trifling in amount. He came now to the article of cottons. The duty was calculated at 2,600,000*l* sterling; but there was received from it at the Exchequer but 500,000*l*, all the rest went in drawbacks; and under all these considerations they came to this—whether for 500,000*l* they would undergo all the annoyance and trouble imposed, as well as placing impediments in the way of trade, and that for collecting the excise duty on an article calculated to bring to the Exchequer 2,000,000*l*, but of which the real amount was only 500,000*l*. What was their duty then? It was some indication what was likely to be the consequences, that to induce the House to agree to the motion, it was expressly and distinctly stated that it could be but temporary. (*Hear.*) The tax upon cotton was admitted to be a bad one. Two years afterwards it was found to be so bad, that his noble friend and himself had the satisfaction of coming down to that House and declaring that they would get rid of the obnoxious tax—and they now felt the full advantage of its certain repeal. (*Hear.*) But what benefit for the agriculturists did his hon. friend propose in the imposition of a duty of 10*l* upon foreign tallow for a year or two, to raise expectations which could not be realised? Those hopes would be disappointed, and those who were now urging on the present question would call loudly for the repeal of a tax so very obnoxious as a tax upon a raw material important and useful to a large number of the manufacturers of this country. (*Hear, hear, hear.*) He must observe, on the whole view of the case, that a more extraordinary proposal he had never heard of than that of his hon. friend, which would in effect be to raise the duty on exported soap to 10*l*, whilst it was well known that it could not now be exported at a duty of 3*l*. (*Hear, hear.*) In conclusion, he would intreat the House not to be induced, under the pretence, an honest pretence, he believed, of transferring the burden of one tax to another commodity, to break in upon the system which had been matured and acted upon with such good effect for a long series of years. As to the duty on soap, he would remind the House that that had already been reduced by one-half from what it was, a circumstance which, he thought, gave it the less claim to immediate consideration with a view to further reduction; as for his own part, he was inclined to believe the amount might be better applied to the relief of the agriculturist than by a remission of this particular tax. (*Hear, hear.*) It was on these grounds that he was prepared to resist the proposal of his hon. friend, a course in which he trusted he should be supported by the House.—Mr. HANDLEY replied, he only asked the House to do that for the agricultural interest which the right hon. gentleman the Chancellor of the Exchequer had that evening announced he intended to do with respect to the stamp duties on newspapers.—The House then divided, when there appeared—For the resolution, 125, against it, 195; majority for Ministers, 70.

## TURF INTELLIGENCE.

The avocations of the sportsman may be said to constitute a circle of the most interesting amusement; as, no sooner does he cease to pursue the fox, than the operations of the race course are placed before his eyes; and, therefore, with a view to assist his prospective calculation, as far, at least, as reference is concerned, he will find appended to this article the nominations for the principal stakes throughout the kingdom.

We had supposed it was intended by Mr. Theobald that Rockingham should not again appear on the course; but, it seems, he is named for the Ascot cup, in which also Touchstone makes his appearance; so that, although the formal challenge of the latter was not accepted, which we thought it ought to have been by Rockingham, these horses, both winners of the Doncaster St. Leger, and both consequently possessing superior pretensions, will be brought against each other as fairly as possible. They will "*lie by*" for the contest, and an extraordinary race may be expected.

At the period when the Marquis of Westminster promulgated his challenge for Touchstone, we stated it as our opinion that no racer was able to meet him, at least with a prospect of success, except Rockingham; supposing at the time that Plenipo would never appear again on the theatre of competition, being also aware that Queen of Trumps could not accept the challenge in question on account of its conditions. It is true, Touchstone has been beaten by General Chasse; but there is much reason to believe the success of the latter was owing to the former not being in the best possible condition. We always considered Touchstone as superior to General Chasse, both in speed and powers of endurance, to say nothing of the unruly disinclination to start occasionally manifested by the latter. However, on the other hand, it should be recollected, that the fore legs of a greedy feeder are very liable to "*go*," and, on this account, implicit reliance cannot be placed upon Touchstone. The powers of Touchstone are much inferior to those of Plenipo and Queen of Trumps, particularly the former. Whatever mystery may envelope the turf operations of Plenipo, it has always been our decided conviction, that Mr. Batson never lent his countenance to the swindling transaction at Doncaster; and, as to the Ascot cup affair, it amounts to this, Mr. Batson did not choose to let his horse start for it, and gave notice of his altered intention on the morning of the previous day on which the event was to be decided. Such a circumstance might affect the Book-Man in regard to double events, and p. p. bets, but that circumstance could not be considered an indispensable calculation with the owner of Plenipo. Further, this gentleman declined answering some impertinent questions put to him by an inflated literary

coxcomb, whose mawkish nonsense appears in a dingily-spurious cotemporary; he also rendered himself inaccessible to the weasel-like squeaking of the *soi-disant* "Sporting Reporter;" and, hence may be traced the sources of vituperative abuse with which it has been attempted to bespatter him through the medium of the press. At all events, whatever construction may be put on the racing career of Plenipo, no doubt can be entertained that he is the best horse which has appeared for the last fifty years; we are, indeed, of opinion that he is superior to all his predecessors. He has left the turf (or, at least, so we suppose, from not observing his name in any list which has fallen under our cognizance,) with a sound constitution, altogether free, we believe, from blemish; and therefore, when his form, his mode of going, and his performances, are duly considered, he must appear invaluable as a stallion.

Steeple racing has, of late, been the order of the day, from one end of the kingdom to the other. Up to the present time, there appeared something defective and unsatisfactory in this species of amusement, because the pedestrian spectators could only catch a partial or transitory glimpse of the emulative contest: they might watch the start, or observe the coming in; they might station themselves so as to witness the central exertions for the prize; yet neither the one nor the other gave that sort of satisfaction which is experienced from witnessing a contest on the race course. However, the difficulty has at length been surmounted; and, amongst the obligations for which the racing world is indebted to Liverpool, is what may be called the improvement, if not completion, of the steeple race. At the steeple races, which came off at Liverpool, on the 29th of February, it was so contrived, that the horses should start opposite the grand stand on the race course, and after describing an ill-defined serpentine-sort of a circle (if such an expression be allowable) return to the race course, the last half mile of which (perfectly straight) forming the run in, upon which hurdles were placed, in order to render the business as characteristic and as complete as possible; the horses never being out of sight during the whole race.

Viscount Molyneux was the umpire of the Liverpool steeple races, the grand stand was filled with rank and fashion, the arrangements altogether were admirable; yet, as if to show the fallibility of all human institutions, the first race was tainted with suspicion,—well-founded suspicion of sinister interference and unfair play. Sir T. Stanley's Laurie Todd became the favourite the moment he was named for the stake; and, as no pains were spared in training him for the purpose, as the day of trial approached, he was freely booked to win. He was known to possess

superior speed from his performances on the race course, from which, however, he was withdrawn, owing to his restive disposition. He had been hunted for several seasons with the fox hounds of his owner, generally ridden by Joe Howard, the first whipper-in: his vicious disposition had therefore been in a great degree neutralized, he had become a tolerable fencer, while, on the score of speed, he was able to distance all his competitors—with ease. Such was the state of the case, when the horses came to the post.

All went on very well for some time—till, in fact, the horses approached the race course on their return, when Laurie Todd appeared in front, looking like a winner. The business had been so contrived that the horses should pass through a gate place, situated near Blue Anchor Bridge, both on going out and returning; and for that purpose the gate had been chained securely back or open. Cockahoop was known to be an extraordinary jumper, and it was thought by a person, who stood to win on him, that the gate, if shut, would prove an insurmountable obstacle to Laurie Todd, whom he alone dreaded; he had placed himself for the purpose, and on the approach of the horses, knocked out the staple which held back the gate with a stone, and closed it—as he thought unobserved. As Laurie Todd had passed through the gate place on running out, he made for it naturally enough on his return. Laurie Todd had lost an eye, and so resolutely did he rush for the gate place that his rider could scarcely twist him from it; in fact, owing to this unlooked-for and awkward circumstance, the horse made a sort of swerve at the adjoining fence, came down, unhorsed his rider, and before Mr. Powell had time to remount, Cockahoop run against him, by which he was slightly hurt, and by which the success of Laurie Todd was rendered impossible. Cockahoop was thus much impeded in his progress, and Captain Beecher enable to win on The Duke, without difficulty. The sinister meddler is well known, and the finger of scorn must for ever point to the dealer in *coculus indicus*, *mandragora*, and other drowsy syrups!

The Queen of Trumps has accepted for the trade cup in Liverpool Craven Meeting, and is to carry 8st 11lb—enough, in all conscience, for a four-year-old to labour under for two miles and a half, the latter part of which is very distressing, being a straight half mile, with a gradual ascent; a very short period of dry weather renders the Liverpool course as hard as a Macadamised road; and therefore, under all the circumstances of the case, we cannot divest ourselves of fears for the safety of the Cambrian Queen's suspicious fore feet; she possesses uncommon power as well as extraordinary speed (the one resulting principally from the other) and we should be inclined to book her to win, even against General Chasse upon his favourite course, *could she be insured from "breaking down"*—of which, however, looking at her

family, particularly at her sire (*Velocipede*) as well as at her age, we cannot help entertaining doubts. She has sustained no severe public race, because she could so very easily outstrip all her competitors, which is greatly in her favour; but then she carried weight for age; now, however, that she has been handicapped, and an extra weight allotted her, we cannot help regarding her as an uncertain animal to back. General Chasse (five years old) has no ordinary weight to carry, 9st 4lb, which must surely bring him below several inferior horses which appear as his opponents; for instance, Sir J. Gerard's *Billinge* (a five-year old), if he be not "as slow as a top," ought to run well home with 7st 10lbs. Or, what should prevent Jupiter from winning, seeing that he carries 16lbs less than the General, and 9lb less than Queen of Trumps?

For the Trade Cup in the Liverpool July Meeting Queen of Trumps does not appear; in which, however, General Chasse shews himself, with the same weight as in the Craven Meeting; he is met, amongst the rest, by Red Rover, the present favourite for the Chester Cup, carrying 8lb less (8st 10lb) which ought to make him a formidable rival. The General and Red Rover are each five years old, 5lb are equal to a distance, or 240 yards, and therefore if Red Rover can support his present pretensions, he cannot fail to beat the General. Time will show. Where the powers of the competitors are weighed as finely as gold, as in handicaps, for instance, predictions upon the event become very uncertain.

Hitherto we have been speaking of events of the first consideration in the provinces, but which excite little interest amongst the metropolitan turfites (if at least we except the Ascot Cup) whose semi-hebdomadal disquisitions at Hyde Park Corner are principally directed to the prospective contemplation, at the present moment, of the Riddlesworth, the Portland Handicap, the Derby, and the Oaks; on the two former of which considerable business has been transacted; while the Derby presents a formidable array of figures upon paper, which amounts to little as far as money transactions are concerned; in the language of the school, no "blow has been struck," though the fine weather (which commenced on the 18th ult.) by dissipating, in some degree, the hitherto impervious cloud which enveloped the mystery of the training stable, will unquestionably infuse into the betting circle an energetic vigour, of which, throughout the winter, it has been utterly destitute. The Oaks has been characterised by a state of vapid inanition throughout the last month, or at least from its commencement up to the period when these manuscript remarks were placed in the hands of that most valuable member of society, that instructive luminary of the mental world, the compositor.

A HERFORD OX,  
THE PROPERTY OF T. SENYOR, ESQ. AYLESBURY;  
Exhibited at the Smithfield Show, 1855  
Engraved & Published by J. B. G. & Co. 41, Fleet Street, London.

# THE FARMER'S MAGAZINE.

MAY, 1836.

[VOL. IV.

## THE PLATE.

The subject of the Plate is a Four Years and Two Months old Ox, of the pure Hereford breed ; bred by the REV. J. SMYTHES, of Lynch Court, near Leominster, Herefordshire, and fed by J. T. SENIOR, Esq., of Aylesbury, Bucks. This animal was exhibited at the last Smithfield Show, when a premium of Twenty Sovereigns was awarded to the Feeder and a Silver Medal to the Breeder. This Ox was much admired, and considered a perfect specimen of the true Hereford stock.

## ORIGINAL LETTERS.

No. XXIII.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

"It is incalculable what is gained by substituting division of labour for division of land."—HARRIET MARTINEAU.

SIR,—An extract lately given in the "Times" from Mr. Gleig's new work, the "Chronicles of Waltham," has induced me to revert to a subject on which I addressed a letter to you about two years ago, viz., the remedy of small farms as the favourite panacea of some writers for agricultural distress. On the occasion to which I have referred some of your correspondents, in alluding to my letter, expressed an entirely different opinion on this principle and very fairly attempted to show that my views on the subject were fallacious. It was not from the want of respect to the opinions of other men, neither was it from any conviction wrought on my mind from the letters of your subscribers, that induced me to decline to answer their objections to my arguments. The truth is, that when I have committed an opinion to your pages, I conceive you and your readers to be the legitimate judges of its correctness, and, consequently, unless I am misconstrued or misunderstood, I feel all I have to do is to remain quiet on the subject.

I know but little of the fashionable reading of the day, and therefore I am not likely to form any very correct estimate of the influence of this new production of Mr. Gleig's on society. I know he is an author of some repute, and it also appears to me, from the extract I have mentioned, that he has adopted a plan for conveying his opinions very likely to secure him the attention of a numerous class of readers, who, although they may view political economy as an interesting science as a whole, still may be possessed of very little taste for the consideration of the subject in a matter of fact form of detail.

Now, Mr. Gleig's plan is to leap over this latter difficulty by giving the interest of a novel in advocating his opinions of Political Economy. It may be prejudice, perhaps, but I confess I do not like this flippant manner of attempting to instil an abstruse and difficult, but, at the same time, a most useful and necessary science. Whenever I meet with a harmonious or romantic writer of statistics it always reminds me of the Fable of the Ass attempting the frolics of the lap dog, or of a grave Chancery Barrister divested of his "Wig of Wisdom" having a game of trap-ball with some half-dozen boarding school heroes, happy in their Midsummer holidays. Fortunately for me I can avail myself of the universal proverb, "that the exception forms the rule," and so except the pamphlets of Miss Martineau from the above observations—just as *some persons* choose to except Scott's novels from the objections usually attached to fiction and romance.

That small farms under certain circumstances and certain situations may be adopted with advantage does not appear to me to admit of any question ; but the very fact of the extensive incorporation of small farms into large farms under the peculiar circumstances of this country during the last 50 years, appears to me to be of itself a conclusive testimony of the policy of the proceeding. The wants and necessities of man teach him wisdom, sagacity, and prudence: this was a mercy especially granted by our Maker when he passed the curse of sin on our first parents, and this blessing has gradually developed itself from the beginning according to the events of each succeeding generation. How wonderfully this wise dispensation appears to have operated in this kingdom during the last half century you have clearly illustrated in an article published in your March number, and taken from the Edinburgh Review, on the "State of Agriculture." Here we have the tremendous fact recalled to our minds that from the year 1790 to 1830, a period of only 40 years,

the population of this country increased from between eight and nine millions of souls to nearly fourteen millions of souls, and that the quantity of the produce of the land has increased in an equal degree to the increase of the population. Now, in the face of these strong and authenticated facts persons are to be found, and Mr. Gleig appears to be among the number who are ready to assert, that during this progressive and astonishing increase of the means of sustaining human life, we have been pursuing a course directly opposed, and indeed fatal to the interests of the people in the means adopted to produce this necessary increase of food. This is truly a difficult doctrine to bring one's mind to.

The soundest basis on which a theory can be supported is by reference to the past as experience for the future; but here we have an outcry against extensive farming, although it is undoubtedly shown that the increase of the produce of the soil has kept due pace with the increased extent of farms throughout the country. The author of the "Chronicles of Waltham," in order, I suppose, to give an interest to his reasoning, would have his readers believe that the throwing together of small farms—in order to make large ones—was effected by the most heartless and unjust conduct on the part of landed proprietors towards small occupiers, by ejecting them from their farms and homesteads, to make room for the larger farmers or yeomen; in fact, Mr. Gleig represents the conduct of the English landlords in this respect to have been somewhat as ruthless and inconsiderate towards their humble tenants, during the period of agricultural prosperity, as the Irish landlords of modern days are supposed to be unfeeling towards their dependants. It is from a false impression on this matter which causes Mr. Gleig to fall into a long string of errors. It was not the landlords that drove off the small farmers at that period, but it was the advancing system of agriculture; the extensive employment of capital in the improvement and cultivation of the land, which it was quite incompetent for the small farmers to undertake, and which rendered it impossible for them to compete with their richer neighbours in the market for land. Human nature, as far as I can understand, was formed of about the same materials in the year 1800 that we find it to be in 1836, and the consequence was, that landlords had the very natural predilection to high rents and responsible tenants in preference to low rents exacted from pauper occupiers. This was the real cause of the union of this class of persons, a cause severe in its effects towards those on whom it bore heavily, but fraught with consequences to the community too vast in its nature to attempt a delineation, and too vast in its effect in increasing the produce of the land to leave a doubt in the opinion of any reasonable set of men who possess a moderate share of knowledge of rural affairs; but that the mind of man, under the blessing of Providence, in this difficulty, adopted the only remedy within its reach, in order to obtain a sufficient increased production of food to support the wonderful increased population of the country. The present depressed state of the landed interest does not offer, that I am aware of, any feature of a *suicidal nature*, but, on the contrary, I think it must be a general impression, that if enterprise, skill, and capital could at all times and under all difficulties ensure success to its possessors, the landed interest at this time would not be hastening to destruction. No, this depression is not brought about by the changing of small farms into large farms, neither does it owe its existence to any profuse manner of living or habits of life peculiar to those depending on the land, but it

is to be attributed entirely to those unfortunate measures of Parliament commonly known as Pitt's Bank Restriction Act of 1797—Peel's Bill of 1819—and that odious, wicked, and demoralizing impost the Malt Tax. The Bank Restriction was the Parent Demon, and Peel's Bill the Offspring. Let me now take you for a few minutes to the first chapter of the first book of Smith's *Wealth of Nations*, and we shall find that "Division of Labour" is the subject this great man is dealing with; and here we are told, "the impossibility of making so complete and entire a separation of all the different branches employed in agriculture is, perhaps, the reason why the improvement of the productive powers of labour in this art do not always keep pace with the improvements in manufactures. The most opulent nations indeed generally excel all their neighbours in agriculture, as well as in manufactures; but they are commonly more distinguished by their superiority in the latter than in the former." Adam Smith wrote his profound work about the year 1773, at which period the population of England was not less than eight millions. The extensive system of farming was not then generally adopted. Now, at that time had this acute philosopher been told that within the next succeeding fifty or sixty years there was to be an increase of five or six millions of people, would it not have been immediately obvious to his comprehensive mind that the necessity thus brought about for an increased production of food would have the effect of improving the art of agriculture in an astonishing degree?

Now, with such of us as have had the benefit of subsequent experience there *can be* but one opinion on this subject. The improvement of British agriculture during the last half century has been truly astounding; and now let us inquire how the great principle of the "*Division of Labour*" has been assisting to this end. Adam Smith tells us, that with the exception of the separate occupation of a shepherd it was not competent to the farmer of his day to avail himself of the great benefit of the division of labour of which so effective an example was afforded him by artisans and manufacturers. This observation strictly applied to the existing circumstances of the time at which he wrote. The Hill or Flock Farms of that period were almost exclusively appropriated to the keeping of sheep. But little was then known of a succession of green and corn crops, and consequently but a small part of the arable land was kept in tilth, the far greater portion being in old grass lays for sheep feed. For such a system of farming it required but a trifling extent either of manual or horse labour, and so it was necessary, as Adam Smith describes, for the agricultural labourer to be Jack of all Trades, carter, hedger, thrasher, &c., &c., just as the season of the year required. The fertile corn lands and rich lowland pastures were at this time divided into small occupations; the expense attendant on cultivating this description of soil had the effect of rendering it impossible for the capital of the farmer of those days to command any thing like an extensive holding. With such a cramped state of things it was found possible to support eight millions of persons from the produce of the earth; but, when these eight millions had added one-third more to their numbers, and far more than a proportion of one-third to their individual wants, in the comforts and necessities of life, the facility and means of production available by the "*Division of Labour*" soon began to unfold its secrets to the cultivators of the soil. The Hill or Flock Farms which had heretofore been used almost exclusively for the keeping of sheep now

began to assume a very different system of management. By a judicious outlay of capital and by a happy combination of the growth of corn, with the feeding of stock, not only was there a great increase of the produce of the white crops from this description of land, but the means of keeping many more sheep was found to be the result of these improved arable resources; and now it was no longer difficult, as Adam Smith describes it to have been in 1775, to adopt a division of labour in the economy of the management of a farm. On the same Hill farm, where the needy occupier of 1775 employed perhaps only a shepherd and one or two other men, did the whole of the work of the farm with a team of four horses, and whose flock of sheep did not exceed two or three hundred ewes, was now to be found under the management of a man of capital employing a shepherd, an under-shepherd, two or three carters, an ox-man, hedgers, thrashers, and a host of helpers in the different pursuits of the modern method of farming. Now, the occasion for horse labour had increased from four to ten or twelve, independent of an ox team, and the flock of sheep of the last century, miserable both as to character and number, was found to be astonishingly improved in the former, and equally increased in the latter of these deficiencies. In the lowlands and rich arable vales too it now became obvious that by the division of labour superseding the division of land, the means of a great increase of produce as well as a great increased demand for labour was immediately the consequence. It was now discovered, on land which had been esteemed *too good* to apply to the keeping of stock, that by a judicious provision of esculent food, not only was a considerable profit derived from this resource, but that at the same time this system of farming had the effect of increasing the produce of the corn crops. Thus, under these circumstances, the character and habits of the tenantry of this country underwent a complete change. The rental of the land was naturally enough increased by the improved system of agriculture, or in other words by the newly-discovered capabilities of the productiveness of land; but, as these resources were only within the reach of the capitalist, he alone could afford to give the increased rental value, and the man whose only capital was labour felt it more to his advantage and comfort to exchange his labour for the money of a master than to embark it in the uncertain speculation of producing a small crop for the market, and where he must have contended, with manifest disadvantage in company with the larger occupier; he found, that labour separated from capital was divested of half its advantages; the yeoman felt, that capital embarked in labour was its most profitable employment. The theorist advocate for small farms may here ask, with all these acknowledged advantages, why then these complaints of agricultural distress? and what is far more obvious to the understanding than complaint—why the repeated ruin to large farmers that we see every day, and how arises the constant advertisements for sale of rural mansions and estates? how, with all the improvements you have described as effected by the division of labour of land, comes it to pass that these difficulties are really in existence?

These questions would be, I think, best answered by asking another question, and it is this, if small small farming would have avoided all these evils, why is it at the present moment that the small occupiers (for there are many yet to be found) are even in greater difficulties than the extensive occupiers? That the small farmer adds in a greater degree to the difficulties of the community at large there can, I think, be no doubt, for it is proverbial a far more ex-

tensive proportion of labour is employed by the large than by the small holder of land, and *with a surplus population* the employment of labour forms no very trifling feature in the commonwealth.

If then both suffer, it must be from some *common cause*, and not from any peculiar arrangement of letting the land in large or small occupations. The prevailing custom in this respect in any particular soil or locality, or under peculiar circumstances, will be a self-acting test of the wisdom of the method; and I think we may safely assure ourselves of the fact, that when we find some inconsiderable portion of the community attempting to advance a doctrine, built only on the foundation of a visionary theory, in opposition to the results of practice, that we must not look with much hope of relief to such a quarter. In my last letter I wrote, labour gives a *rest* to the senses, and not labour gives a *rest* to the senses.—I am, Sir, your obedient and very humble servant,  
Sussex, April, 1836. AGRICULTOR.

## No. XXIV.

## TO THE EDITOR OF "THE FARMER'S MAGAZINE."

SIR,—That the general cry of distress which has been raised by the agriculturists must have a just foundation, cannot reasonably be doubted. Indeed, whoever considers the low prices of corn, more especially of wheat, which is lower than it has been for a generation, can hardly be of any other opinion. It is therefore, somewhat surprising that a contrary notion has been lately advanced in a popular journal, the *Morning Chronicle*.

In that paper of the 12th January, the prices of wheat at Mark Lane were quoted at from 32s to 43s per qr, being on the average 37s 6d, equal to 4s 8d per imperial bushel nearly. Yet in the same paper the very next day, appeared an article headed "Flourishing State of Agriculture." This is indeed a "flourish" which could hardly have been expected. It did not however originate with the *Morning Chronicle*, but was copied from an Edinburgh paper, the *Weekly Chronicle*. The writer of the article accounts for the cheapness of corn by saying it is simply owing to abundance (which indeed is true), and the abundance to the recent improvements in agriculture *here* (that is in Scotland, particularly the Lothians), and in *Ireland*; amongst which improvements he enumerates draining, and the use of rape-cake as a manure. These however, are rather improvements of the land than in modes of agriculture, especially the former, and require an outlay of capital. No doubt draining, where necessary, and the purchase of manure, will make land yield greater crops,—that is no new discovery; the question is, will they repay the expense at the present prices of corn? We are not to take this for granted—and the fact of increased production is no conclusive proof of it. This writer mentions other improvements which have of late been introduced, as the Chevalier barley, and thrashing by steam; and then in conclusion he indulges in a sneer at the lazy Lawrences of the South, who walk about with their hands in their pockets, and then complain of want; but, says he, it is from the South that the cry of agricultural distress has chiefly proceeded; that is, from those who resolutely and firmly adhere to the imperfect and expensive customs of their forefathers, and refuse to adopt the most self-evident improvements; who still continue to employ from three to five horses at one plough, and thresh their grain with a couple of sticks cut from the nearest plantation. "It is ridiculous," he adds, "to hear

such men complain of distress." He then alludes to the improvements in manufactures, by which various manufactured articles have been rendered cheaper to the consumer, at the same time that the manufacturers are doing well; whence he would have us conclude that the case is the same with the farmers who conduct their business properly.

Now, though it may be true at present that the manufacturing interest is flourishing, it is not very long since there were great complaints, in the cotton branch more especially, that the masters were doing very ill, and the workmen starving. The case was similar in the iron trade, the lead trade, the salt trade, the coal trade, shipping concerns, and other branches of business, which were all much depressed. It was the superabundant capital of the country, no longer wanted for war loans, seeking employment in every way, which produced an over-much supply, and led to a ruinous competition, and a general fall of prices beyond what the restriction of the currency could have occasioned, though this also had a great effect. The evil indeed cured itself, partly by diminished supply, partly by a more extended trade, but much capital was sunk and lost. It may, and probably will, be the same with agriculture; in the mean time, however, there must be much present suffering and loss.

It may be observed, further, on this writer's sentiment in regard to the neglect of agricultural improvements in the South, if by that term he means England in general, that though there may be some parts to which his remarks apply, there are large districts of this country cultivated in a manner which the boasted farming of Scotland does not surpass; and he offers no sufficient proof that the present prices of corn will pay the grower anything; for, as already observed, the mere fact of increased production does not of itself prove it.

If Scotch farming be so superior that wheat can be grown in the Lothians to pay the grower at 4s 8d or 5s per bushel, let an actual farmer of respectable character come forward in his proper person and say so, and we shall be bound to believe him; but let us not take the fact from the mere assumption of an anonymous writer in an Edinburgh paper. Some years ago, the writer of this was in company with a gentleman of Berwickshire, where the same husbandry prevails, and the land is of as good a quality as in the Lothians. He was a large occupier of land, partly as owner, partly as tenant. Corn was at that time very low, though not so low as at present, and in conversation on the subject, he observed that 7s to 8s per bushel for wheat would pay him very well, but 6s would not do; and if 6s would not do then, it is inconceivable that 5s will do now.

When the shipowners, some years ago, were loud in their complaints of distress, which they attributed to Mr. Huskisson's commercial arrangements, commonly called the reciprocity treaties, he in answer shewed by official documents that there had been a very considerable increase in British registered tonnage, and that the tonnage of foreign vessels trading to this country had not increased in the same proportion. The argument was good as far as it rested on the comparative amount of British and foreign tonnage, but it did not prove the non-existence of the distress. On the contrary, the increase of the tonnage of British vessels shewed the cause of that distress, and its remedy; it shewed that it was owing to excessive competition, and more between British shipowners themselves, than between them and foreigners. So, in like manner, over-production may be considered as the cause of the existing agricultural distress; which cannot be referred in any degree, as

in the case of the shipowners, to foreign competition, for the farming interest have had the home market entirely to themselves for about four years, and yet the price of corn has got lower and lower, though no foreign corn has come in, and the competition has been confined entirely to the farmers of the United Kingdom, including Canada, the supply from which colony is not considerable.

There is a clever article on this subject in the last number of the Edinburgh Review, in which the amazing increase of the productive powers of the soil is fully made out, and satisfactorily proved; whence it clearly appears that great as the increase of population has been of late years, the increase of production, contrary to Mr. Malthus's theory, has been still greater. But the Reviewer does not draw the natural conclusion that it has been too great. He takes rather the same view of the question as the writer in the Edinburgh paper before mentioned, only he is more moderate in his censure of English farming, and does not harshly pronounce that while such and such methods prevail, it is ridiculous to talk of distress.

It may be asked, if the farmers, as is alleged, have been going backwards for years, where did they get the capital for increased outlay upon the land? Perhaps the country bankers can answer the question. At all events it must have been got from some quarter and laid out upon the land; for it does not appear that improved modes of cultivation merely without increased expense, or even a succession of favourable seasons, are sufficient to account for the amazing increase and superabundance of the products of the soil, though they may, and doubtless have, occasioned it in part.

The same causes, whatever they may be, which have occasioned the depreciation here, have been in operation on the continent of Europe, where corn, low as it is in this country, is still lower; so that even in Holland, which has always been held up as an example of the good effects of a free trade in corn, the government have lately been obliged to pass a corn law, for the protection of Dutch agriculture, similar in principle to our English corn law.

It is surely desirable at this juncture that some notice should be taken of these attempts to persuade the public that the farmers are prospering, or, if they are not, that it is their own fault; and thus to deprive them even of sympathy in misfortune. How far these observations may be successful in combating the notions upon which these attempts are entirely founded, that increased production is of itself a proof of prosperity, you will judge. If you consider them deserving of attention, you will perhaps afford them a place in your magazine, and in that case some remarks on the means of relief from the existing pressure may be the subject of a future letter. ## THE DEVON HEIFER.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—Your having, in December last, presented your readers with a Plate of Mr. Quartly's celebrated Devon Heifer, *Curiosity*, induces me to forward you some further particulars respecting that beautiful creature, especially as I am now enabled to state, that her carcase was as extraordinarily and equally fat, as the figure of the living animal was perfect to the eye of the connoisseur.

Another reason for my sending this communication

is the unfortunately incorrect and detracting representation which your artist gave of his model,—the portrait conveying, I assure you, no idea whatever of the beauty of the original. You may be incredulous of this assertion; to convince you of its truth, let me lay before you the animal's proportions, as taken by Mr. Quartly, and given me by himself,—proportions for which Renton's Grazier's Ready Reckoner contains no calculated weight, so immense was her girth in comparison with her length and height. These were her dimensions:—Length, from the head to the extremity of the rump, 6 ft. 6 in.; height, at the top of the shoulder, 4 ft. 1½ in.; girth, 7 ft. 10 in. I hope this will convince you how inadequately the animal was represented in the Farmer's Magazine. I do not write this as blame; I am aware that errors cannot entirely be excluded, even from a work so ably conducted as your valuable periodical; but the wrong impression which your print must leave, I wish removed, and that Mr. Quartly may receive at your hands the justice of a correct representation.

The Heifer was slaughtered at Southmolton, by Messrs. Cole and Dunn, for the market of Saturday, the 2nd instant, and her carcase was declared by all observers, to be the fattest they ever saw exhibited in the neighbourhood. Were I to particularize one part of it for praise, I should do injustice to the remainder. Suffice it to say, then, and let the public judge, that with a height of only 4 ft. 1½ in. and a frame, when lean, of twenty-eight score, her weight was upwards of fifty score pounds.

Trusting you will insert this in your next publication, I have the honour, Sir, to be your most obedient servant,  
A DEVONIAN.

Southmolton, 15th April, 1836.

[The sketch of the heifer was taken by an artist at Exeter, who was represented as fully competent. We never saw the animal, and therefore had no opportunity of estimating its correctness.—ED. F. MAG.]

No. XXVI.

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

Shropshire, April 13.

MR. EDITOR—I have no enmity to the Church, all I desire is as much good as can be obtained from it at a less public cost. It appears that the net average income of the Bishops is 5,930*l.*, but the Archbishop of Canterbury has an income of 32,000*l.*, according to the statement of Dr. Lushington, and the Bishop of London an income of 15,000*l.*, according to his own admission. In France, an Archbishop has only 1,041*l.* per annum, and a Bishop 625*l.* A Cardinal at Rome, next in dignity to the Pope, has between four and 500*l.* per annum, these latter sums are enough for Christian pastors. The great Founder of our religion said, “The birds of the air have nests, and the foxes have holes, but the Son of Man has not where to lay his head.”

The English Bishops have not, I suspect, included in their returns the annual value of their parks and palaces. The gross revenue of the Deans and Chapters is 350,861*l.* They were deemed superfluous in the times of Henry VIII. Cromwell said, a prebendary is neither a learner nor a teacher, but a good viander, who wastes his substance in good belly cheer. The net average

income of rectories and vicarages is 385*l.* per annum. If there were as many incumbents as benefices, and each received only this stipend, there would be no complaint that the clergy were overpaid; but the waste and injustice consist in the disproportion between the number of livings and the individuals among whom they are shared.

From authentic returns it appears that the number of incumbents in England and Wales, among whom the 10,498 benefices are divided, is under 7,000, so that some fortunate persons, with good connexions, have two, three, and four livings, besides dignities in cathedrals, preacher-ships, chaplainships, and other tit-bits of preferments, too numerous to mention.

CURATES.—From the income of these we may form an estimate of the expense really necessary for the maintenance of an efficient clergy. It is notorious that the curates, and poor clergy who are unable to bear the charge of curates, form nearly the whole of the working bees. There are 5,282, it seems, who have on an average a salary of 80*l.*, amounting for the whole to 424,796*l.*, so that for about double that sum an efficient clergy, adequate to the discharge of all practical offices of the national worship, may be obtained. The fairest and most equitable mode of proceeding would be for Government to appoint proper land valuers to go over all the church lands throughout the United Kingdom of England, Ireland, and Wales, and put a fair value upon it, according to other property of the same description, taking correct accounts of all the estimates, so as they can conscientiously take their oaths upon them if required; and let every pew-proprietor make a sacrifice, by giving up his pew, and paying a certain rent annually for it, and let the pew-rents go to the general fund for the support of the clergy; then abolish all tithes; and, at the same time, take off the malt tax, reduce the county rates, and all other local payments which press so heavily on the farmer. I think these things would go far to relieve us. Some say these could not be done; the government could not do without the malt tax. Let them reduce their expenses; begin at home, first, by doing away with unmerited pensions and sinecures. But another says, you would only confer a benefit upon the landlord, instead of the public. I would at the same time repeal the corn laws; thus, I think, the whole nation would reap the benefit, instead of one particular class. It would be madness to attempt to repeal the corn laws, while the farmer has to labour under all his present burdens, and those who assert otherwise are mere theorists instead of practical men. I would give no Bishop more than 1,000*l.* per annum, and do away with Deans, Chapters, and Prebendaries; and allow every parish priest, according to his family, not less than 150*l.* per annum, nor more than 300*l.* salary, with a suitable house, and small quantity of glebe sufficient for a cow and horse for private use. As I have no more room, and shall be trespassing upon you too much, if you think these few hints worthy of a place in your valuable Magazine, after your correction, you will be at liberty to insert them, and oblige your's, &c.  
A CONSTANT READER.

No. XXVII.

## TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—Having in a former letter shown, as is

hoped, sufficiently, in answer to the Edinburgh Weekly Chronicle, that increased production is not in itself a proof of a flourishing state of agriculture, but rather the chief cause of the distress which is generally acknowledged to exist, we proceed to consider what prospect there is of the evil being remedied, and what can be done towards its cure.

In the first place let the present corn law be steadily maintained; as being far preferable to a modification of it by the imposition of a fixed duty, in compliance with the ideas of some persons who argue that this would be better, both for the corn growers and the public. But the agriculturists should take care not to be cajoled by any such representations; for they may depend upon it, that when the prices of corn are low, both here and on the Continent, as they are at present, foreign corn would not be kept out by any fixed duty that could be thought of. And on the other hand, if prices in consequence of any very material failure of crops, were very high, indicating scarcity, and threatening famine, the duty could not be maintained; for the people must, at all events, be fed, and when the British and Irish farmers most wanted protection, they would be deprived of it inevitably. On this subject it was well observed by an intelligent corn merchant, Mr. Joseph Sanders of Liverpool, in his examination before a former parliamentary committee, that the measure would fail at both ends; and it is only fair if in a bad season the duty must be withdrawn, to encourage importation, that in a good season, when the home produce is plentiful, and prices low, the farmer should have the home market secured to himself by high or prohibitory duties. Corn may indeed be commercially considered as an article *sui generis*. It being so precarious, and dependent on seasons, so fluctuating in price, and at the same time of the first necessity, the object of the legislature should be to secure as far as possible a sufficient supply at all times, and as much steadiness of price as the vicissitudes of the seasons will permit. This is the principle of the present law; it encourages importation when prices are high, and represses it when they are low, thus tending towards a medium.

Some have thought that a fixed duty would answer the purpose better, but how they make this out is not clearly explained, nor is it very easy to discover.

The most considerable objection against the present law seems to be its rapid effect in reducing prices, so as to render importation unsafe to the merchant; for if corn has to be brought from any great distance, as even from Danzig the greatest corn port, it may happen that before it can arrive prices will be so much reduced in the home market, and the duty so much raised, that it cannot be sold but at a loss greatly aggravated by this double operation; and though the article may be warehoused, this is but a poor dependence, for we have seen that the home market may be in fact closed against it for years, and exportation can scarcely ever take place without loss. Whether a bounty on the exportation of foreign corn so circumstanced, when the duty had suddenly risen, so as to be in a manner prohibitory, might be allowed for a certain time, in order to facilitate the exportation, is a thing which perhaps deserves to be considered. This would be a protection to the importer, without injury to the home grower, or, indeed, to the public; for when the ports opened the duties received on the importation of corn would

more than pay any bounties that would be likely to be claimed on exportation, so that there would be only a return of a portion of the duties actually in hand. Be this as it may, let the landed interest stick to the present law, and leave the question of a bounty, under the circumstances before-mentioned, to the corn merchants, and the Government.

It has indeed been argued that our corn law has not hindered prices from falling ruinously low, and therefore that it has done the farmers no good. But that does not follow. For low as prices are they would have been still lower if there had been a free importation, as is evident from the comparative prices in England and on the Continent,\* and there cannot be a doubt that if corn could now come in free, or even at a moderate duty, it would be largely imported, and meet British corn in our already over-stocked markets. There is good reason then to say to the farmers of this United Kingdom—stick to the corn law, which was devised by one of the best informed statesmen of the age, the late Mr. Huskisson. His plan was somewhat modified indeed in its details by the influence of the Duke of Wellington, but not very materially; in its principle not at all. Under this law the home grower has at present the monopoly of the home market, and it does not appear how protection can be carried further, unless by a bounty on exportation of home grown corn which, though such a thing did exist formerly, would hardly be tolerated now.

Several plans of relief have been suggested, to most of which there are objections, as inefficient or impracticable, or in some view inadvisable; though, perhaps, some of them may be found practicable, and in a degree useful. The committees of the two houses of parliament now engaged in the investigation of this subject may be able to throw some new light upon it; though, as was observed with reference to it, by a noble lord well informed as to matters of trade,† a great deal cannot be expected from their labours.

But if over-production be the source of the evil, of which there seems no doubt, one remedy is obvious—namely to plough less—to grow no more corn than can be sold at a reasonable and remunerating price. Then the corn law would be found an adequate and sufficient protection.

It may be asked how is this to be done? A practical farmer would be best able to answer the question, and a speculative writer, in his closet, can only offer a suggestion or two. But suppose that on light lands, where the Norfolk husbandry prevails, a part were suffered to remain three years in grass instead of two; and on stronger soils the ancient fallow were resorted to, instead of the modern practice of growing potatoes or turnips before wheat, a very prevalent husbandry in the populous parts of the country, by these means less corn would be grown, and there would be no greater provision for cattle than before. So that corn would rise and cattle and their products milk butter and cheese, would not fall—and the expenses

\* Comparative prices of wheat, barley, and oats in England and France from the Morning Chronicle of 21st Jan. 1836.

	England.	France.	Difference.
Wheat per quarter	£2 4s	£1 13s	11s.
Barley do.	1 12s	0 15s 9d	16s 3d.
Oats do.	1 1s	0 14s 6d	6s 6d.

† Lord Ashburton.

of cultivation would be reduced. It might be difficult, or rather impossible, to get such a multifarious body as the farmers of the United Kingdom to agree upon such a plan, but a sense of their own interest will most probably induce many to adopt some plan of this kind; and necessity may compel many more to do the same. For with a diminished capital, and injured credit, they will not be able to provide the outlay necessary to keep up the same system of cultivation, and draw as much from the land as they have done. So that if produce does not persuade, necessity will oblige them to pursue a different course; that is to have less arable and more pasture land. Thus it is that the evil will cure itself in time, though it is to be feared not without much suffering to many deserving individuals, who will not be able to struggle through their difficulties. This is what has happened over and over again in the commercial and manufacturing departments, and is in fact the natural, though but occasional result of free competition. In other branches, it is true, relief has also been found in the increase of foreign trade, which in agriculture cannot be the case—for on the Continent of Europe, we have seen, the corn markets are lower than they are here; and if they were not, there are duties and prohibitions in the way in almost every country. In the United States of America the prices are higher than with us, and corn might be sent thither with advantage if there were no duty to prevent it; but there is a duty in that country also, on the importation of foreign corn, which amounts to a prohibition. In short the clamourers for a free trade in corn should be told, if they do not know it, or do not consider it, that it is a thing which scarcely exists. As long as these high prices continue in the United States, the British West India Colonies may be supplied from the brother country, instead of drawing their supplies from those States as they have been in the habit of doing; and this seems to be the only channel of exportation to which the British farmer can look for relief; and to that probably for no long period. But great hopes may be entertained from the flourishing state of trade and manufactures, and an increasing population, that the home consumption will be extended, and if this be met by a diminished supply, a more effectual relief may be afforded than any Parliamentary enactments that can be at all contemplated, can possibly give. Already indeed there seems to be a reaction; prices are looking up, and it may be hoped that the farmer has seen the worst of it. Still whatever can be done by parliament, consistently with justice to other classes of the community, and the general benefit, ought to be done.

Throughout these observations it is taken for granted that the agriculture of the country has a fair claim to protection. Those who maintain that the trade in corn should be altogether free, take a very partial view of the question. When the manufacturing, and the commercial interests generally, are protected by duties and regulations against foreign competition, surely the agricultural, which, including Ireland, is the most important interest of all, cannot in common justice be left without any. None but men blinded by avarice and selfishness, or bigots to a system, will say so. The political economists in parliament and elsewhere, when they advocate a free trade in corn, should be met with this argument. "Let it be so when every other trade is equally free: then, and not till then." This argument has lately been taken up by the friends of the agricultural inter-

est; and they will do well to enforce it on all needful occasions. There was a petition presented some time ago to parliament from Dundee in Scotland, a principal seat of the linen manufacture, in favour of a free importation of corn. This might have been met very properly on the part of the agricultural interest by a proposition from some county member for a repeal of the duty on foreign linens. It is, indeed, unanswerable.

Feb. 24, 1836.

T. F.

Comparison of foreign grain with the English market from the *Times* of 18th January. The mean or average of the prices of wheat of the first quality at Hamburg, Amsterdam, Antwerp, and Stettin is 28s 1d the quarter, and the mean price of wheat of the first quality in London, being 44s 6d the quarter, it follows that the mean prices in London is 58½ per cent higher than at the four above-mentioned places.

### UNION AGRICULTURAL SOCIETY'S ANNUAL SHOW OF STOCK, &c. AND SALE OF SHORT-HORNS.

This Great Agricultural Exhibition took place at Coldstream, on Tuesday the 5th April; and in respect to the quality of the stock brought forward, was certainly never exceeded by any similar exhibition in the kingdom, and in point of numbers the Highland Society has alone surpassed it. The place of exhibition was a large field of old pasture, conveniently situated at a short distance from Coldstream, granted for the purpose, by Mr. Wm. Bell, as acting for Sir John Marjoribanks; and proper arrangements having been made by the Stewards, assisted by the Secretary, for the reception of the stock, the short-horned bulls and other animals of that class were, by 11 o'clock, the hour appointed for the show-yard being opened to the public, all stationed and ready for the examination of the Judges. Forty bulls had been regularly entered, and 17 more came upon the ground, making together the extraordinary number of 57 pure short-horns, for the premiums, or for sale. The show of cows, queys, and steers, was much more limited; but most of them were very fine animals. At 12 o'clock the judges commenced their arduous task. This duty was undertaken by Mr. Wilson, Cockburn, Mr. Turnbull, Crooks, and Mr. Hogarth, Akeld; and most assiduously and ably performed. The award of the premiums delivered in by them to the Secretary was as follows, viz.

#### CLASS FIRST.—BULLS.

1. For the best Bull, to Mr. Cockburn, Sisterpath, Berwickshire, for his bull Favourite, No. 4 of the list, Fifteen Pounds.
2. For the second best ditto, to Mr. Bell, Linton, Roxburghshire, for his white bull, No. 14 of the list, Ten Pounds.
3. For the best Cow of any age, to Mr. Carnegie, Edrom Newton, Berwickshire, for his cow Duchess, No. 4 of the list, Five Pounds.
4. For the second best ditto, to Mr. Thompson, Pawson, Northumberland, for his Roan Cow, No. 1 of the list, Three Pounds.
5. For the best Quey, two years old, not awarded.
6. For the best ditto, one year old, to Mr. Hall, St. Helens, Berwickshire, Three Pounds.
7. For the two best Steers, three years old, to Mr. Taitt, of Langrigg, Three Pounds.

8. For the two best ditto, two years old, to Mr. Hall, St. Helens, Three Pounds.

The Judges beg to express their utmost satisfaction with the exhibition of the Short-horned Stock, particularly of Bulls, the number of superior animals exhibited at one time being quite unprecedented in the district.

#### CLASS SECOND.—HORSES.

Premium 1st and 2d. For the two best Draught Stallions as under.

No. 1. To Mr. Cossar, Dunse, for his Black Stallion, Sampson, Twenty Pounds.

No. 2. To Mr. George Aitchison, Abbey St. Bathans, for his Bay Stallion, Traveller, Twenty Pounds.

The Judges experienced great difficulty in deciding these premiums, the show of Draught Stallions being particularly good, both as to number and quality.

3. For the best Hunting or Riding like Colt or Filly, for premium offered by D. Robertson, Esq. of Ladykirk, to Mr. Sprott of Riddell, for his two year old Colt, by Mac Orville, No. 4 of the list, Ten Guineas.

#### CLASS THIRD.—SWINE.

Prem. 1. For the best Boar, no competition.

2. For the best Sow, to Mr. Curry, Cornhill, Two Pounds.

There was also a Sweepstakes of One Sovereign each, for the best Sow, between Mr. Curry and Mr. Fulton, Hatchetize, which was gained by Mr. Curry.

#### IMPLEMENTS OF HUSBANDRY.

To Mr. Veitch, Inchbonny, for his improved Turnip Machine (to pay expenses) One Pound.

To Mr. Robert Brown, Wooler, for his Turnip Sowing Machine (also to pay expenses) One Pound.

To Mr. Nisbit of Lambden, for an improved Turnip Cutter, one Pound.

At an early hour the show ground displayed a great attendance of noblemen and gentlemen, together with most of the eminent breeders and farmers of the surrounding districts; and also a numerous and very gratifying attendance of strangers, not only from some of the English counties, but also from the Lothians, and several of the northern counties of Scotland. There were likewise several gentlemen from the United States and from Canada. Amongst the number were—Duke of Buccleuch, Marquis of Lothian, Marquis of Tweeddale, Earl of Kintore, Mr. Swinton of Swinton, Mr. Wilson of Cumledge, Mr. Morrison of Auchentoul, Mr. Burn Callander, Mr. Sprott of Riddell, Mr. Grey of West Ord, Mr. Macbraire of Broadmeadows, Mr. Renton of Mordington, Mr. Wilkie of Foulden, Mr. Dickson of Belchester, Mr. Baillie yr. of Jerviswoode, Mr. Tod of Drygrange, Mr. Geddes, Morayshire, &c. &c.

**SHORT HORNS.**—That the public may duly appreciate the character of the Society's exhibitions, it may be proper to state, that after having established, by the exertions of many years, and by giving very high premiums, a capital breed of short-horned stock, &c. its premiums have for some years past been somewhat restricted in amount, yet kept sufficiently high to induce the principal breeders on both sides of the Border to bring forward their best stock at the annual exhibitions. In addition to which the Society has used every possible means to make its "Show-yard" a market, where those desirous of establishing the breed of short-horns elsewhere, might procure in the easiest and cheapest way, excellent stock of the pure breed;—and consequently,

at least half of the stock exhibited is generally for sale; and the attendance of strangers, as purchasers, is yearly becoming more and more numerous.

The result of this last mentioned branch of the exhibition, being of considerable public importance, ought to be particularly noticed. Among the many eminent breeders, Mr. Chrisp of Doddington, Northumberland, turned out the greatest number for sale. Of twelve yearling bulls, shewn by him, eight were disposed of on the ground, at from 20*l* to 30*l* each; (occasionally in such bargains a discount is allowed) and the rest were likely to be disposed of afterwards. Among the other gentlemen who exposed bulls for sale were Mr. Oliver of Blakelaw; Mr. Thomas Chrisp, Hawkhill; Mr. Laidler, St. Cuthberts; Mr. Jopling, Castlelaw; Mr. Turnbull, Crooks; Mr. Boag, Kilham, &c. &c., and so far as could be ascertained amidst the bustle of the day, about thirty bulls of different ages were sold. Yearlings at from 18*l* and 20*l*, to 30*l*, and those of other ages at from 20*l* to 40*l*. Many of the purchasers were from the northern counties of Scotland. It is a remarkable fact, in reference to those prices, that the Society gave, less than twenty years ago, one hundred pounds for the hire of a bull, the property of Mr. Mason of Chilton, for a season.

**COWS AND QUEYS.**—Comparatively few were shown; but several of them, particularly Mr. Carnegie's, and Mr. Thomson's, Pawson, were very superior animals. Few breeders, it is understood, will part with their best cows, on almost any terms, and it is said no sales were made.

**STEERS.**—The steers were much admired. Mr. Taitt's attracted great notice; and were sold at 30*l* a head—to be forwarded by one of the Leith or Lothian steamers to the London market!

**THE STALLIONS.**—Thirty of this class were regularly entered for the exhibition; many others, however, having been delayed on the road were brought upon the ground though not entered; and altogether there were upwards of forty horses. But between one and two o'clock, when they were ordered to be brought out, it unfortunately came on to rain so heavily as to create considerable difficulty in conducting this part of the show to a satisfactory close; and many of the spectators were forced to leave the ground and get under cover. The display of so many fine animals was extremely imposing.

The competition for the premium given by David Robertson, Esq. excited much interest. There were nine competitors; and there can be little doubt of a considerable increase of competition in succeeding years.

The thorough-bred stallion Contest, and the Cleveland horse Competitor, brought out by Mr. Miller of Sunlavs Mauns, (a description of horse said to be wanted) were much noticed.

Two short-horned cows, each with a calf, shewn by Mr. Jopling, were also much admired.

Of the Implements of Husbandry, an improved Turnip Cutter, exhibited by Mr. Nisbit of Lambden, appeared to give great satisfaction; however, as it did not arrive till near the end of the show, sufficient attention could not be paid to it. But as it is likely when fully known, to come into general use, another opportunity will be taken to give a full description of it.

The business of the exhibition closed shortly after three o'clock, having evidently given entire satisfaction to all who attended it.

## AGRICULTURAL DISTRESS.

SIR,—Those who are on the stretch to find an unnatural cause for what is called AGRICULTURAL DISTRESS, would wish to persuade themselves and others that there is something monstrous and unaccountable in it; yet, they will probably soon discover that it is produced by the same cause as every other kind of commercial distress, viz., the relative proportions between the means of production and the market of consumption; or, in other words, it is regulated on the laws of supply and demand, in the same way as every other description of goods which is brought into the market of consumption.

In the case in question, I should think it will be found out that the consumption of agricultural produce was never so great as at the present moment; but it will at the same time be discovered, that, notwithstanding the great increase in consumption, the increase of production is still in a greater proportion, making the supply greater than the demand.

The common question is, that while every person has good wages and is actively employed, how comes it that the price of grain remains distressingly low? The reply is, that there is more grain in the market than there are mouths to eat it.

It has been most unfortunately the opinion of our rulers and law givers, of all parties in politics, that when corn was low and there was a superabundance of population, which meant a population for which there was no work,—that inducements were to be held out to them to go into other countries as fast as possible,—“Emigrate, Emigrate,”—was the constant cry,—let us above all things encourage Emigration. These gentlemen never considered that every person who Emigrates carries a stomach with him, and that stomachs are the consumers of food. Every person thus sent abroad was a lost consumer to England, and a consumer produced to the country to which he was sent. The effect in taking one away to be given to a rival, is equal to multiplying by two,—and those countries to which we sent our emigrants, were benefited by every individual, while we lost in the same proportion. The result of this is that America has got rid of her agricultural distress, and she is now in a most flourishing agricultural condition; she has got our stomachs to digest her superfluous corn, while our corn remains on hand uneaten. Ah! but say the emigration committee, they were mere paupers who went abroad. This, however, will not serve their purpose,—for every nine out of ten who went abroad were people of some capital—artisans, whose very industry and ingenuity were the best capital of the country,—men who were tax-payers as well as corn-eaters, and who, in fact, were the pith and sinew of our industry. So long as this system is encouraged, agricultural distress must of necessity prevail.

Let any agriculturist ask himself the question,—who are our customers? His answer will immediately be—our great manufacturing population. His next question will be,—ought we to diminish that population? Common sense answers no,—increase it. How may it be increased? By making it to flourish. How may that be effected? By giving it an untaxed raw material, and by taking off other direct taxes which bear upon industry. What are these taxes? The tax on cotton, silk, and flax; the taxes on paper, soap, tea, and other necessaries. What would be the result of the taking off such taxes? The result would be that the working population who always endeavour to sell their labour in the best market, would remain at home, as they would be enabled to live with less money; they also get better wages, as the tax on the raw material is always a

tax on wages—the manufactured article being required to be produced as cheap for re-sale as it can be produced in other countries where the raw material is not taxed. Would this have the effect of stopping emigration? Undoubtedly. How would this affect agriculture? It would keep the stomachs at home to be employed in the profitable digestion of corn. Ah! but cry out the agriculturists—that increases pauperism. The reply is that it increases wealth in a threefold ratio, and pauperism, where there is prosperity, is a mere bugbear. In fact to encourage employment by making production cheap, that is by taking the taxes off the necessaries of life, is the very best antidote to pauperism.

There are, no doubt, various other reasons for corn having fallen below the price of production. First, steam navigation, which has brought large tracts of country, which formerly lay comparatively waste, in Ireland, Scotland, and England, into competition with old estates, and these have increased in value, while the ancient lands have perhaps fallen in proportion, making a kind of equalization. Secondly,—Rail-roads have produced a similar effect. Thirdly, improvement in cultivation has increased production to a great extent, even on old lands. In many cases where draining has been used, the increase in production is not less than 30 per cent. The bone manure, the facility of obtaining manure, the increase of green crop, have all greatly added to the increase of production. Had the increase of consumption been kept to go on in a parallel line with that of production, the prices would undoubtedly have kept pace with the supply. But while impolitic duties and taxes are permitted to remain on the raw material and on the necessaries of life, the tide of emigration will continue to flow to those countries where similar articles are not taxed.

Had we had one million more people in England manufacturing for other countries, in place of their having gone into other countries to manufacture there—to teach the natives to become our opponents, we should have had one million more consumers than we have; this would have made agriculture prosperous; we should also have had one million more tax-payers, which would have enabled Ministers to take off the very taxes which have goaded the artisans from their homes.

The answer will be—why, is not the manufactures now flourishing? What would you have? My reply is that such has been the case only since one half the duty was taken off the raw material, and since a considerable proportion of the taxes have been taken off the necessaries of life.

If our legislators will work out that principle, they will find that manufactures will improve yet more. This will relieve the agricultural pauperism, which has so long prevailed, and get the whole country into action. This system of itself, and nothing but this system can, by increasing an industrious population, dispel the cloud of agricultural distress, but by following a contrary policy, agricultural distress will still prevail.

There is one fact self-evident, and therefore undeniable, on which the whole question of agricultural prosperity depends, and that fact is the extent and comfort of the labouring and manufacturing population. By increasing the comforts and means of subsistence of that class, their prosperity will be promoted,—emigration stayed and population thereby rapidly increased. I think that it will not be denied that the increase of consumption is the first remedy of low prices, and surely that being obtained in agricultural produce, distress will gradually vanish. I should, in conclusion, with all deference, submit that

the first enquiry of our legislature should be that of making investigation how far they can safely remove taxes from the first necessities of life, and from that which is a tax upon labour—viz., all duties paid upon the raw material used in our manufactories.

A CUMBERLAND WEAVER.

THE TITHE COMMUTATION BILL.

TO THE EDITOR OF THE KENTISH OBSERVER.

SIR,—In perusing your valuable paper of Thursday last, the 7th instant, my attention was drawn to an extract from the *Farmers's Magazine* on the "Tithe Commutation Bill" now before parliament. Although I dissent from some of the observations which have been made by the writer, yet the good sense, and practical knowledge, which, for the most part, distinguish that publication, entitle it to much respect, and induces me to suppose that one of the statements has arisen rather from inadvertency than from want of information, and from not having gone into the details necessary to ascertain how far it is supported either by figures or by facts.

The statement to which I allude is as follows:—"The deduction of 25 per cent. from the usual demand of tithes is *purely nominal*, and will not affect the clergy, who have been accustomed to this outlay, and *even more*, in the expenses attendant on the collection of tithes." To this point I will confine myself in the present letter, and will endeavour to shew that, so far as regards the collection of rectorial tithes, the grounds upon which this estimate are made are untenable. Although not distinctly expressed, I presume that "the collection" is intended to embrace not only the cost of collecting, but all the subsequent expenses incident to the conversion of the tithes into money, and upon that supposition I will proceed to an examination of the different items of the account.

In the letter which I addressed to the Editor of the *Morning Herald*, on the 21st of March, and which he kindly inserted in his paper of the 26th of that month, I publicly offered "to enter into a contract with the rector of Murston, and the lay impropriators of Bapchild and Tonge, (three parishes immediately contiguous to my own,) not only to collect all the rectorial tithes due to them in their respective parishes, but to pay the threshers, they might think proper to employ, the whole expense of threshing, to find a barn or barns for the reception of their produce, and to carry out that produce, when threshed, to any mart, or private customer, (the distance not to exceed 4 miles,) for the straw and horsemeat only." I now renew this offer through the medium of your valuable paper (not with any hope of its being accepted), and will endeavour to shew that the collection of the rectorial tithes of a parish, so far from being a source of loss, is one of considerable profit to the party entitled to collect them. In illustration of this part of the subject, I will first take the article of wheat, and assume that the tithes of 100 acres of wheat are to be collected: and I will further suppose (for, during a series of years, I have grown, upon an average, more than that quantity myself,) that the produce of those 100 acres will amount, *communibus annis*, to 40 shocks per acre. On the 10 acres due to the tithe proprietor there will, on this calculation, be 400 shocks of wheat; in fertile years, these 400

shocks will produce 400 bushels of wheat, or 50 quarters, which, at 50s per quarter, will amount to 125*l*, and the straw arising from them, and the horsemeat produced by the operation of threshing, added to the amount of the wheat, will constitute the aggregate value of the gross produce.

With the view of ascertaining the weight of straw contained in 10 sheaves of wheat, taken indiscriminately from the stack (and provincially termed a shock), I directed my bailiff to have that quantity threshed, and immediately weighed. The weight was 84½lbs. Four hundred shocks of wheat, therefore, will produce 33,800lbs of straw, which reduced into London loads of 36 trusses, each truss weighing 36lbs, will amount to 26 loads, and 104lbs. The price of straw in the London markets fluctuating, for the most part, from 30s to 42s per load, would average 36s. At the present time, it might be stated at 34s. I will, therefore, take this price, and apply it in the first instance, to those districts which are within reach of the London markets, or of great towns, in which the price will be nearly the same.

£. s. d.		Per Contra.	£. s. d.	
26 loads of straw				
at 34s. ....	42 0 0	Carrying 10A.		
100 baskets of		of wheat with		
horsemeat, 8d. 3 6 8		8 horses in 4		
		waggons, at		
	£45 6 8	25s per team		
Ded. expenses 27 6 0		of 4 horses		
		and 2 men... 2 10 0		
Balance in favor		4 additional la-		
of collector £18 0 8		borers, at 5s. 1 0 0		
		Threshing 50qs		
		at 4s ..... 10 0 0		
		Binding 26 loads		
		of straw, at 1s 1 6 0		
		1 team 10 days in		
		carrying straw		
		to market... 10 0 0		
		Carrying out		
		50qs at 1s... 2 10 0		
				£27 6 0

I will next take the price of straw sold in the country (distance 4 miles) at 25s per load.

£. s. d.		Per Contra.
26 loads of straw		Expenses the same, except that in carrying out the straw, from the team being able to make two journeys per day, the labor will be completed in 5 days instead of 10, and £5 must, therefore, be deducted, which will leave the account £226s.
at 25s ....	32 10 0	
Horsemeat as before .....	3 6 8	
	£35 16 8	
Ded. expenses. 22 6 0		
Balance in favor of collector... 13 10 8		

Lastly, I will consider the straw and horsemeat when consumed on the premises, and will then estimate the price of the former at only 18s per load.

£. s. d.		Expenses the same as in the second case, except that as there will be no charge for binding, nor for carrying out the straw, a deduction of £6 6s must be made, which will leave the account £16.
26 loads of straw		
at 18s. ....	23 3 0	
Horsemeat as before .....	3 6 8	
	£26 14 8	
Deduct... 16 0 0		

Balance in favor of collector... £10 14 8

I will now endeavour to shew what is the real per centage on these estimates in the three several cases :

1st Case.	£.	s.	d.	
50qrs wheat at 50s...	125	0	0	
Straw and horsemeat	45	6	8	
	170	6	8	
25 per cent would be	42	11	8	
Actual expenses...	27	6	0	or something more than 16 per cent.
2nd Case.	£.	s.	d.	
Wheat.....	125	0	0	
Straw and horsemeat	35	16	0	
	160	16	0	
25 per cent would be	40	4	2	
Actual expenses...	22	6	0	or less than 14 per ct.
3d Case.	£.	s.	d.	
Wheat.....	125	0	0	
Straw and horsemeat	26	14	8	
	151	14	8	
25 per cent would be	37	18	8	
Expenses.....	16	0	0	or less than 11 per ct.

In the 2nd and 3d cases the value of the straw and horsemeat is much less than 25 per cent. of the gross produce, and yet leaves a large profit for the collector; in the 1st case, it is rather more than 25 per cent, and leaves a much larger profit.

In making these estimates, I have put the expenses at a higher rate than it costs me to collect the tithes arising from 100 acres of wheat, and have been desirous of fixing the value of the straw and horsemeat at a lower price than upon an average of seven years they will probably produce. If there be any errors, I can only say that they are not intentional on my part, and are open to correction; but, I feel confident, that the respective balances cannot be materially reduced; that in each case there will be a considerable profit; and that the assumption, that "in no case can tithes be collected at less than 25 per cent. of the value of the gross produce," is not only not supported by facts, but is utterly destitute of foundation.

I am, &c.

W. JOHN LUSHINGTON.

Rodmersham Lodge,  
Sittingbourne, April 11.

TITHES.

TO THE EDITOR OF THE EXETER AND PLYMOUTH GAZETTE.

"The simple and easy mode of settling the Tithes Question," which was published in a Thursday's contemporary, of the 24th ultimo, appears to me to be so deserving of circulation, that I shall be obliged to you for giving it a place in your widely ranging paper of this week.

"Fix a maximum of composition to be taken in lieu of tithes, at so much in the pound, of the value of the land calculated by the gross rent, or by the valuation of two competent judges; and in case of any difference of opinion that difference to be decided by a third.

"The composition to vary according to soil, circumstances and situations, say from 2s 6d to 3s 6d, in the pound for rectorial; from 15d to 21d for vicarial; and from 2s to 2s 6d for lay impropriate tithes.—Agreements renewable every four or seven years.

AN OLD TITHIE PAYER.

THE TITHIE COMMUTATION BILL.

SIR,—No topic can be more interesting to the farmer, at the present moment, than the Tithie Commutation Bill. I beg leave therefore to offer to your readers some remarks, which may tend to bring home to the mind of every farmer the means of ascertaining what will be the future effect of the bill in his own particular case.

The essential principles of the bill are to be found in the 29th clause, and to this clause all the other provisions of the bill are subordinate or subservient; it regulates the mode by which the future rent-charge is to be computed. From the gross amount of the annual produce of a farm, on an average of the last seven years, 25 or 40 per cent. is to be deducted; 25 per cent. if the tithie hitherto payable has been equal in value to the sum that would be the result of that abatement, and 40 per cent. if the sum hitherto paid has been inferior to the sum that would be the result of the abatement of 40 per cent. (On the amount that would result from either of these abatements or any intermediate abatement, the future annual rent-charge would be established.

In order to elucidate the effect of this clause, I will here offer to your readers a homely illustration of what would be the future workings of the bill, in regard to the farms around me. I took upon myself, for a time, the powers of a commissioner under the bill, and put the following questions to a neighbouring farmer, to which he gave me the answers that I report.

Q.—What is the quantity of land on your farm?

A.—130 acres.

Q.—What is your rent?

A.—£50 per annum.

Q.—What is the amount of your composition for tithie?

A.—£11 10s.

Q.—Do you, or does your rector, pay rates on the amount of your tithie?

The farmer could not give a decided answer to this question, but I have since ascertained that the rates are paid by the farmer, which would enhance the tithie to the amount of £14.

Q.—What number of acres of wheat do you grow annually on an average?

A.—About 25 acres.

Q.—What number of acres of oats?

A.—About 25 acres.

Q.—What quantity of barley, beans, peas, tares, clover, or other produce?

A.—(After some computation)—About 37 acres.

Q.—How do you account for the remaining acres of your farm?

A.—It is chiefly unproductive as to tithie, being fallow, old lay, hedge rows, or road ways, and a small part wood land.

My next interrogatories drew from him the following estimate of the gross annual value of his produce on an average of the last seven years.

25 acres of wheat.....	£250
25           oats.....	150
37           other produce.....	150

£550

I must here observe, that the amount of produce on the farm alluded to, (which farm presents generally a fair average of the rent, tithie, and produce, of the farms in this neighbourhood), may appear large in regard to rent, but it is land of heavy and expensive tillage, and of little natural fertility; on which a large produce is obtained only by a great outlay of capital, and not two-thirds of the estimated

amount of gross produce can come into the farmer's pocket. The amount of tithe on such lands has been kept down by restricting cultivation; tithe has been moderated, that cultivation might not be abandoned, and all tithe be lost; and enlarged and improved cultivation has been the result of moderated tithe. Now the bill treacherously and unjustly assumes this improved cultivation as the basis of the future rent-charge, without any regard to the value or rent of land.

I will now suppose the commissioner giving judgment in the case adduced. Assuming, probably, somewhat of the hypocrite, he will say to the farmer or the landlord—"The clergy, anxious to promote harmony and good will in their respective neighbourhoods, are generously disposed to abate even to the extent of 40 per cent. of their just claims. The act of Parliament, in that spirit of conciliation, releases to you 40 per cent. of your produce tithe free; deducting then this 40 per cent. from £550, the amount of your gross produce, the remainder will be £330; and your settled tithe to be commuted into a rent-charge will be £33, payable half yearly." Thus the farm that has hitherto paid about £14 for tithe, would be, by the award of the commissioner, liable to an annual rent-charge of £33; variable, however, in the manner which shall be presently explained.

Clause 44 provides for the conversion of the money payment, or rent-charge, which is to be computed, in the manner I have mentioned, into a corn rent, of which the money payment would be annually variable according to the price of corn, in the following manner. The award or written contract for the commutation of tithe into a corn rent is to specify the quantity of wheat, barley, and oats, which the sum decided on by the commissioner would have purchased, on an average of the seven years previous to the contract,—had such sum been expended, one-third in the purchase of wheat, one-third in the purchase of oats, and one-third in the purchase of barley; and the sum thereafter annually payable would be such as, according to the annual statement of the comptroller of corn returns, would purchase the quantity of wheat, oats, and barley, specified in the contract. There is this palpable grievance and injustice in the proposed variation of the rent-charge. In a bad season the price of corn might be doubled; but the benefit of increased price would belong rather to the foreign merchant than to the home grower; because, in bad seasons, the farmer is generally compelled to carry his corn to an early and unfavourable market, and he would be liable, if a party to the award of the commissioners, to an increased payment, under circumstances when he could least afford it.

Clause 45 enacts that the tenant be empowered to deduct from his rent the amount of each half-yearly rent-charge, which he will be compelled to pay in preference to all other claims upon his land.

How then is the landlord to be indemnified? It is a curious circumstance that the solution of this important question is no where indicated by any marginal note on the bill, but is to be found, however, in the 17th clause. The landlord, in requital for the rent-charge, which is to be deducted from his rent, is to be placed in the situation of the original tithe owner, and is to possess all the powers of the original tithe owner for enforcing from his tenant the render of tithe in kind, or of any composition in lieu thereof. The landlord in fact is to change places with the tithe owner, and to become himself an odious tithe collector. The bill should rather be called a commutation of tithe owner, than a commutation of tithe. Hitherto, harmony and good-will have gene-

rally prevailed between the landlord and the tenant—contention and discord between the tenant and the clergy; hereafter landlord, clergy, and tenant will be embroiled in mutual strife and animosities.

There is yet one other clause in the bill that I will notice; it is the 47th clause. Should the half-yearly payment of the rent-charge, to be awarded by the bill, be forty days in arrear, even though it may not have been legally demanded, the owner of the rent-charge, lay or ecclesiastic, may enter upon the lands assigned for the payment—eject both landlord and tenant—and take the land to farm on his own account, till his demand and all his expenses be satisfied.

The bill has evidently been framed under the auspices of the clergy, and for their benefit, it would add 50 or 100 per cent. to their revenues. The law charges that would attend the awards of the commissioners would be enormous; litigation would be interminable; even dead men under the provisions of the bill are to continue parties to suits at law (see clause 36); and that the clergy may not be discouraged, they are allowed by the bill (see clause 42), to borrow money for law expenses, and charge their benefices for twenty years with the repayment. The farmer has long and earnestly desired an equitable commutation of tithe that his industry might be free; now, far better will it be for him to bear yet for a while the wrongs he suffers, than that the present bill should pass into a law.

I am, Sir, your faithful and obedient servant,  
WILLIAM MARTER.

*Shelly's farm, Knockholt.*

The best answer to those unprincipled scribes who assuming to be of *no party*, embrace every opportunity of calumniating the present Ministers by representing them as hostile to the Agricultural interest is furnished by the conduct of Mr. Poulett Thompson in the House of Commons on Thursday night last. Mr. Robinson moved

"For the appointment of a Select Committee to inquire into the regulations and restrictions under which foreign corn might be admitted to entry, for the purpose of being manufactured into flour and re-exported without prejudice to the public revenue or to the agricultural interests."

Mr. Thompson said that he had no objection to the foreign corn in the country being ground *in bond*, provided *all the produce of the corn so ground were re-exported*. This did not meet the object of Mr. Robinson, who wished that the *flour only* should be exported, and he accordingly divided the House upon the motion. We imagine there will scarcely be any one found possessed of hardihood enough to say that Mr. P. Thomson did not regard the interests of the Agriculturists in this matter. We doubt not this fact will remain unnoticed by this *disinterested* friend of the Agricultural interest, as did that part of the account of the death of Lord Sondes, which marked his magnificent liberality in allowing a year's rent to his tenantry.—*Mark Lane Express*.

We are assured on the authority of persons who profess to know the working of the New Poor Law in Suffolk, that "150 out of 280,000 per annum will be saved, and the deserving poor be far better off.—*Sussex Advertiser*."

## ISLINGTON MARKET.

FROM THE MARK LANE EXPRESS, OF MONDAY APRIL 18.

The opening of the New Market at Islington this day has, during the past week, formed a leading topic of discussion amongst those whose business has hitherto taken them to Smithfield. As there may be some of our readers who are unacquainted with the magnificence of the undertaking in which Mr. Perkins has embarked with so much public spirit, we briefly state for their information, that the New Islington Market covers 15 acres of ground, whilst the area of Smithfield is only  $4\frac{1}{2}$  acres, exclusive of a small addition which has recently been made to it. The capital already expended upon the New Market amounts to £100,000. It is capable of accommodating with ease and comfort, both to the animals themselves, and the persons attending the Market, 7,000 Beasts, 40,000 Sheep, 1,000 Pigs, and 500 calves, and is amply supplied with water from wells sunk on the premises, and worked by a windmill. It is really surprising that opposed as Mr. Perkins has been by the wealth and influence of the Corporation of the City of London he should have so far succeeded as to have carried his plan into execution almost single-handed; he has, however, received most invaluable assistance both in and out of the House of Commons from Mr. Handley, the Member for Lincolnshire, a circumstance which will afford ample evidence to the agriculturists that there is nothing in the scheme prejudicial to *their* interests. To those who have attended Smithfield on a market-day no argument is requisite to prove the necessity of the removal of the cattle market to a more extended site. The cruelty inflicted on the animals in driving and huddling them together in masses, and the fever excited, and consequent injury to the meat, from want of water, can only be appreciated by those who have been eye-witnesses of what takes place during the night preceding, and upon the market-day. It may meet the views of some parties, but it cannot be to the advantage of the grazier that his beasts should, by their lank and worried aspect be deteriorated as far as appearance goes to the extent of 30s. or 40s. per head. To those who have not had the opportunity of witnessing the state of Smithfield on a full market-day, the best evidence of the necessity of removing it to a more suitable spot, will be found in the report of a deputation from the Common Council of the City of London, appointed to confer with the Lords of the Privy Council for the Board of Trade, to the Select Committee for letting the City lands in 1809. After considerable discussion between their Lordships and the deputation respecting the enlargement of Smithfield market, their Lordships distinctly stated—

“That such enlargement would by no means afford the accommodation required, particularly in a place so much intersected with Public Streets and Ways, through which a very considerable part of the Commercial Traffic of the Metropolis necessarily passed daily with Carts, Drays, and other Carriages, which occasion a great injury to the Cattle in the present Market-Place, AND CANNOT BE PREVENTED BY ANY ENLARGEMENT THEREOF, and much less provide for such progressive increase of the Business of the Market, as might reasonably be

expected; and therefore it appeared to them THAT THE REMOVAL OF THE MARKET was necessary, to the nearest and most convenient situation at which not less than 12 Acres of uninterrupted space could be obtained.”

If such were the opinions of their lordships in 1809 how much more necessary must the removal be in 1836, when the quantity of cattle sold in Smithfield Market has so enormously increased. At that period, “12 acres of uninterrupted space” were deemed requisite; Mr. Perkins has now provided 15 acres. There are two points now urged against the proprietor of the Islington Market. First, that he has been guilty of a breach of faith, in promising not to interfere with Smithfield if he were permitted to open his Market at Islington; and Secondly, that in refusing to suffer the same individuals to act as Bankers at his Market and at Smithfield, he seeks to establish a monopoly for his own benefit. With respect to the first charge, we apprehend it is by no means generally known that the pledge alluded to was given before the *compensation clause* was introduced. That if the Bill had passed in its original state Mr. Perkins would have rigidly adhered to his promise, but that when his opponents succeeded in altering the Bill in a way which operated prejudicially to him, he considered himself, as every other man would, absolved from his promise. In regard to the second charge having reference to the Bankers it is well known that they have been the most active opponents of the New Market. A numerous body of graziers throughout the country have pledged themselves to give their support to those individuals only who will encourage the Islington Market. Would it be wise? would it be honest in Mr. Perkins to afford the least indulgence to those individuals who, although they might perform the mechanical duties devolving upon them at the Islington Market with correctness, yet would by their acts and expressions in other respects do all in their power to thwart the wishes of himself and his friends? We feel persuaded that Mr. Perkins will succeed to the utmost extent of his wishes, and the New Market will long stand a monument of his public spirit. We desire that he should be amply repaid for the capital he has embarked, and the risk he has run. But if we could discover the slightest disposition to avail himself of the voice of public opinion loudly expressed in favour of his plan, for the purpose of establishing a monopoly for his own advantage, we would be the first to point out the deception, and to resist the attempt.

Bone-dust strewed lightly over the rows where peas, beans, or any other seeds are sown, will insure a finer and more healthy plant than any other kind of manure. It should not be buried in the soil; its virtue is carried downward by the moisture from the land, which retains its productive quality for two or three seasons. In Yorkshire, the farmers have availed themselves of it to a very great extent, and find it cheaper even for wheat and barley crops, than the best compost. It is not unfrequent there to see the name of the proprietor of an estate written on his lawn with luxuriant grass, produced only by drilling fine bone dust in the track of the letters, which may be delineated with chalk or the small end of a walk-sticking.—*Correspondent of the Suffolk Chronicle.*

## ETIQUETTE OF THE FIELD.

At the request of a correspondent, we take up the pen to give our opinion upon a subject, which we nevertheless approach with diffidence; not that it requires more than ordinary preception or moderate powers of description, not that sophistry, syllogism, or abstruse logical deduction, is requisite in its illustrative elucidation; but, as it has never yet been placed before the eyes of the Sporting World through the medium of the beautiful science of writing, and consequently not received the unqualified or indisputable sanction of statutory enactment, old sportsmen as we are, we feel some degree of hesitation in assuming the office of Arbitrator *Elegantiarum* to our generous and highly-esteemed fraternity. However, as our vocabulary will, in all human probability, be incomplete, and therefore susceptible of improvement, we earnestly solicit the corrective and emendatory communications of those who have more successfully studied the subject, and are consequently better calculated to illustrate it.

Of the various branches of Field Sports, hunting, strictly so called, or following the hounds, being infinitely more important than any other, is entitled to priority of consideration. This diversion is not only conducted with spirit and elegance, but with a degree of liberality unknown to every other ramification of the chase: as a proof of which it may be said to commence with making known the fixtures, through the medium of the public prints, in order that those who are anxious to enjoy it may be apprised in due time of the places where the hounds meet, and where the field are therefore expected to assemble.

If the term *festival* cannot be correctly applied to the fixture or meeting, it must be regarded as an assemblage where the sparkling joy of eager anticipation animates every countenance; nor indeed is this pleasing excitement confined to the sportsmen, since their gallant steeds never fail to express their pleasingly impatient expectations in a manner too impressively palpable to be for one moment mistaken; whilst the sagacious well taught pack evince their lively joy by indications equally intelligible.

Hacks are exchanged for hunters; when, after the lapse of a few minutes, the word is given, and the hounds rush into cover; while the field place themselves in such a manner as, if possible, to induce the fox to break away over the most eligible part of the country. All is still and breathless expectation, except perhaps the pawing of an impatient steed, the half playful rearing of another, till the well-recognized signal is borne on the breeze, and "Hark to Ringwood! Have at him there!" thrills through the nerves, impressing a sensation which no form of words can imagine to the mind:—"Tally ho! Tally ho! There he goes!" The huntsman goes away with the leading hounds, but not a sportsman ought to stir till the hounds are

fairly away, when each should take his place, and keep it. However, it not unfrequently happens that, at this critical moment, the hurly-burly riders, and ill-mounted horsemen, render themselves conspicuous by what may be expressively enough termed crossing and jostling, in which the genuine sportsman runs the risk of having his horse or himself injured, and in which the uncouth, ill-mannered, impudent clowns to which I have just alluded, frequently get unhorsed. Apropos: some few years have rolled over heads, since we met Lord Anson's (now Earl of Lichfield) hounds in Leicestershire (at Kirby): a fox was found in a gorse cover at a short distance, which went away in gallant style in face of the whole field. The hurly-burly riders (consisting, as is generally the case, of the lower and illiterate grades of yeomanry, butchers, &c.,) could not be restrained: so that as the hounds left the cover they were thrown into confusion by the random galloping of these semi-barbarians. However, at the first fence, three of these blustering bull-headed fellows were laid sprawling, one of whom in coming to the ground, pitched so completely on his head, his bare head, that we fully expected he would rise no more: but, *n'importe*, he gathered himself up, shook his dirty locks, looked round him, but did not attempt to remonst; that genuine sportsman and accomplished gentleman, Sir J. L. Kaye, cannot have forgotten the circumstance. If the scent be good, these *English-Kentuckians* are distanced in a few minutes; but, if unfortunately, the hounds are brought to cool hunting, they become troublesome—very troublesome.

In saying that every sportsman, as soon as the hounds were fairly away, should take his place and keep it, we do not wish it to be understood, that the field are to go abreast "like the horses of the sun," as Beckford would say, but that they should not cross each other: there are always a few choice spirits who uniformly take the lead, and a good sportsman need think it no disgrace to follow in the wake of such accomplished workmen as the worthy Baronet already mentioned, Mr. Little Gilmour, Mr. John White, Lord Delamere, Mr. James Tomkinson, the veteran Stephen Denston, and some scores of others whom we could mention.

Gates need not *always* be jumped; on the contrary, it will frequently happen that a number of sportsmen approach a gate, when, from picking a cold scent, a cheek, or other circumstances, it may be conveniently opened. It should be passed one at a time, and held by one till the next in succession has hold of it: thus, it is passed as pleasantly as possible. To the credit of fox-hunters, we never witnessed a breach of this highly-laudable decorum or etiquette, except by an ill-tempered Noble Earl, whom it is not necessary to designate more intelligibly. The last time we saw the late and much lamented Sir Harry Goodricke in the field, we observed him very good naturedly return to re-open a gate for

a veteran, whose snow-white locks and withered frame seemed to indicate an unusual length of years, but whose expressive eye brightened with pleasure at this mark of attention from the forwardest of the flock: the aged sportsman did not appear in the livery of the field (scarlet); he was evidently a yeoman of the good old legitimate sort. When it so happens that the hurly-burly crew to whom we have already alluded, approach a gate, a circumstance of frequent occurrence in going from one cover to another, confusion seldom fails to ensue. We have a *crooked*, but very impressive, remembrance of a circumstance of this description; being out in Charnwood Forest with Mr. Osbaldeston's hounds, and picking a cold scent from the base of Whittle Hill towards Ulscroft Woods, a gate was driven towards us, by one of these pests to the hunting field, with considerable violence; we received it on our right hand, the force principally operating on the thumb; we never felt more acute pain than what resulted from this very unpleasant and unwelcome contact, which lasted for some minutes, nor have we been able to straighten our wounded thumb since.

The hounds should never be pressed upon by the horsemen:—if indeed it be a brilliant scent, there is nothing to be apprehended on this account with modern fox-hounds:—and, in following another person over a fence, an interval of time should be allowed to elapse sufficient to ascertain that no accident has happened to your predecessor, but that he has got fairly over it and is out of the way.

Never meet hounds in the face, if it be possible to avoid it; but, should a contact with them be found unavoidable (in a lane, for instance) turn your horse's head the contrary way till they have passed.

Should a sportsman near you become unhorsed, etiquette (and humanity also) requires that you should ascertain if he be hurt or not: in the first case, you must consider yourself bound to render him all the assistance in your power; in the second, you may leave him to shift for himself. You are not bound, by etiquette, to catch his horse for him, should the animal have galloped off; but, if you can conveniently get hold of the animal, hitch the bridle upon the first gatepost you meet with, if you do not choose to wait for the arrival of the rider (the hounds going best pace); it sometimes happens under such circumstances that persons are working in the field, or a countryman may be at hand, to whom the loose nag can be very conveniently handed over.

It will sometimes happen that several sportsmen come to an obstacle that renders dismounting advisable or perhaps indispensable, where turning the horse over is found requisite: the matter becomes easy of accomplishment by catching for each other.

Formerly, on the death of the fox, a scramble took place for the brush; however, at the present day, no *gentleman* ever thinks of dis-

mounting for such a purpose. It is the business of the huntsman and his assistant whips, to deprive the fox of the appendage in question, as well as to prepare his carcase for the honourable sepulchre that awaits him. Should any gentleman be anxious for the brush, he should make known his wishes to the huntsman, who will hand it to him—and of course expect a gratuity in return.

We are not aware of a greater breach of field etiquette that riding before or amongst the hounds under any circumstances. Nothing can be more vexatious to a genuine sportsman, or more trying to the temper of a huntsman. It is sufficient to drive a huntsman mad; and, if, under such circumstances, he resorts to language more *impassioned*, or more *impressively boisterous*, than usual, it ought not to give the slightest offence to those to whom it is addressed. Sportsmen should get out of the way of the huntsman on all occasions.

Like hunting, shooting is a social amusement; which, however, does not admit of that aggregate number of companions which gives a superior degree of animation to the cover side and the impetuous field. It is true, Battu shooting may include half a dozen marksmen; but we could never persuade ourselves to consider it in the light of legitimate diversion; it is an exotic which cannot be rendered indigenous in the British Isles; it has been on the wane for some years, and we heartily wish it was altogether returned to the mongrel sportsmen of the Continent from whom it was very foolishly borrowed. But, as there is something like etiquette in this barbarous wholesale-slaughter system, we must waste a dip of the pen on the subject. In those covers where battu shooting takes place, there are paths formed, along which the sportsmen can walk very conveniently, while others move forward on the outsides. To render this diversion—(if indeed *diversion* it can be called!) as free from danger as possible, the sportsmen should move forward parallel with each other; in fact, whether moving or when they become stationary, this parallel position should be observed, the infringement of which must be regarded as a breach of etiquette. If the cover be so narrow that interior walks are rendered unnecessary, the party is divided, and should be careful to proceed parallel with each other, as in the former case.

By a very easy movement or transition, we are brought to hedge-row shooting, where the parallel movement becomes indispensable to the safety of the sportsmen, as may be very obviously perceived. We have enjoyed excellent diversion in hedge-row shooting at both cocks and peasants, and it has happened more than once that our own gun and that of our companion have been discharged so precisely at the same moment that we have each been unconscious of the circumstance till an oral explanation has taken place, if the smoke from the opposite gun had not already placed the matter beyond all doubt.

If we except battus, shooting does not admit of more than two sportsmen in what may be strictly called a *companionship*; and, as in the preceding case, they should proceed abreast of each other. On the springing of a covey (or the rising of a brood, for in partridge and grouse shooting the same rules of etiquette are applicable;) each shooter selects a bird on his own side, in order to avoid cross-firing or dispute as to who brought down the bird, in case only one falls. An illustrative apostrophe will not be deemed out of place. Two friends of the writer, (who are still living) Mr. B—y and Mr. S—w, the former a fair shot, the latter, having acquired the custom of shutting both eyes and jerking his head when he pulled the trigger, was never of course certain of killing a bird; however, when shooting in company, he seldom failed to claim the bird. These two went out together in the early part of the month of September; the dogs drew and stood; the covey got up; bang went the gun of Mr. S—w, and, as chance would have it, a brace of birds fell; this gentleman, whose eyes had been firmly closed during the operation, opened them time enough to see a bird fall from the gun of Mr. B—y, which he immediately claimed: "Then, (said the latter gentleman) these two must be mine," as he advanced and picked up the birds in question. On another occasion, when the writer happened to be shooting in company with Mr. S—w, a cock pheasant accidentally rose before him; and, as it presented as fine a mark as possible, it was easily brought down. It was immediately claimed by our worthy friend, Mr. S—w, though the writer was very well aware his gun had missed fire, which, on investigation, Mr. S—w was compelled to admit.

On the springing of a covey, select the bird on your own side, as we have already observed; but it may sometimes happen, on the rising of a single bird, for instance, that both sportsmen may fire without being guilty of a breach of etiquette. Whatever game may be killed in the course of the day, it should be equally divided between the parties.

If one party of shooters come in contact with another, they should ascertain each other's intentions as to the future beat or range, and on no account vexatiously *cross or jostle*, as a jockey would express it. If a party be found in possession of a certain tract of moor or country, the second party should immediately retire or withdraw.

Above all, let sportsmen keep steadily in view, the maxim, never to let others surpass them in politeness.

Coursing has been a favourite amusement from the earliest periods to the present time; and has of late years been classified and improved to the greatest extent perhaps of which it is susceptible. We consider it a gross breach of etiquette to slip more than a couple of greyhounds at the same hare, and yet we have not very unfrequently seen it practised, —in a part of the country, however, where,

owing to the frequency of dry pits fringed with brushwood, and similar blinking places, two dogs were scarcely a fair match for a hare. Yet more than a couple of greyhounds ought never to be slipped.

There are various coursing clubs in different parts of the country, the rules and regulations of which may vary according to circumstances; but generally speaking, if persons be appointed to *See-ho!* the game, the field should allow them to be a reasonable distance in advance. He who slips the dogs should also be in advance of the field, but not so forward as the finders. The field should move forward abreast; and, if there happen to be no special finders appointed, no hare can be thus missed. In some parts of the country, horses are used in coursing, while in the marshy parts of it (where the most satisfactory diversion is generally obtained,) they are precluded by the nature of the ground.

## TITHE BILL.

TO THE EDITOR OF THE COURIER.

SIR,—The tithe bill of the best Ministers England ever had is most shameful. *It must not* pass in its present shape, or it will punish all the best farmers in England for being industrious. This I do know, that notwithstanding the low price of produce the last seven years, that farming is improved more than it did in half a century before; the fields are hollow indeed with drains, and manure at Liverpool is 9s per ton at this moment. My father never paid any more, though he sold his wheat at a guinea a bushel: and is it right that the parsons, who neither labour nor toil, should enjoy the fruits of all this industry? Freely they have received and freely they ought to give; even the lay proprietors bought their tithes for almost nothing. I advise the Ministers to drop the bill this session; the parsons are delighted with it—this I know to be a fact. In the mean time let the farmers in every part of the kingdom tell all they know to the reform members. I shall tell my complaints to Mr. Ewart, of Liverpool, and Mr. Thorneley, of Wolverhampton; I will make them completely master of the subject; this is the way we must do. Once more, then, I beg of our good Ministers not to attempt to pass the bill this session.

I am, yours,

A FARMER OF WEST DERBY.

6th April, 1836.

---

Our Breconshire correspondent says that the destruction of sheep and lambs on all the hilly farms is unabated—he mentions several farmers who have lost from 200 to 300 each! And he adds, that of the lambs not one in seven will escape. There had been snow and sleet for five days successively, and it was still lying deep on the high grounds. Not a grain of oats had been sown, and only part of a field here and there ploughed. He states that in the spring of 1786, (50 years ago,) there was a similar season, when the first oats in his neighbourhood were sown on the 12th April. We are sorry to confirm the above report from accounts received from all the adjoining districts. Many thousand sheep have perished in the upper parishes of the three counties which meet at Ramny, and more than three-fourths of the mountain lambs. One correspondent says that he saw 14 sheep dead in one small field; and the Coedcae, the Banwau, and the Wauw are strewn with them. The same season which is destructive to sheep, kills the hares; and many of these are also found dead.—*Welshman.*

## HORSEMANSHIP.

## ROAD-RIDING.

In giving instruction for the accomplishment of any art or science, what may be called (for want of a better expression) the precision of systematic description becomes absolutely requisite, in order to avoid that confusion which could scarcely fail to arise from any other method. But, although such a plan appeared the best calculated to answer the object in view, it is highly proper, in this place, to observe, that, after the pupil has studied all the foregoing lessons, and comes to apply them to practice on the road, or in the ordinary occurrences of life, it is not expected, that, under every circumstance, he should rigidly adopt the formality or stiffness of the school, which however advisable throughout the probationary period, should become ease and gracefulness thereafter. The lessons are the rudiments and essential principles, which, in after practice, are to constitute the system, but characterised by an easy elegance which shall, at the same time give confidence and security to the rider.

Those who are employed by horse-dealers to show horses are hastily thought, at least by those who are ignorant of the true and beautiful art of horsemanship, to ride well. These are mostly persons who have, from early life, been about horses, and thus acquire confidence, while constant practise gives them a firm seat. Their object is to show the horse, as they think, to the best advantage, which, with them, constitutes the very acmé of perfection in riding. For this purpose, they sit as stiff as possible, divide the reins, place their hands low, keep the horse's nose down, and drive him forward, with the spurs, as fast as possible. This method answers the dealer's purpose, since many of the horses, thus exhibited, are lame or unsound in some respects, and by this means their imperfections are much less discernible.

In the previous pages I have had occasion to notice grooms, and I must here again observe, that these persons, from constant practice, ought to ride well, and most of them do acquire a firm steady seat, while very few seem to understand the skilful operation of the hands; and hence may be perceived the reason of the difficulty they experience in the management of an unruly horse: further, many of them handle a quiet horse so roughly as to render him restless and impatient, which often ends in a contest. Many high-bred, well-fed horses manifest a spirit consonant with their breeding and condition; and though they may be checked by a harsh severe hand, are nevertheless irritated by it. The rider becomes irritated also by the impatience to which he has provoked the horse—he therefore applies the spurs, the horse becomes more violent and ungovernable, and a contest is the result, which does not always end in the defeat of the horse; and indeed, end how it may, the horse's temper is soured by the circumstance, and, if violent means be continued, the horse is ruined. The mild, but effective, operation of the hand should render the horse obedient, and it should, at the same time, be characterized by ease, delicacy, and elegance. Under such circumstances, if the horse has been irritated, his temper cools by degrees; and there are few horses so vio-

lent, hot, and impatient, that will not be restrained by these means.

Keeping in mind and acting upon the principles of horsemanship already laid down, the rider on the road should fall into an easy elegant flexibility, agreeable alike to himself and to the animal that carries him, but by no means to suffer inattentive or awkward habits to creep upon him; such as the back to become round, the shoulders to move up and down, the hand to describe a sort of see-saw, the legs to vibrate, &c., circumstances which may be witnessed every day. Let the rider unite system with ease and elegance.

To those who merely walk the horse on the road no observation is necessary here after what has been already stated; but as there are few but wish to proceed more speedily, the walk can be easily extended to the trot, which is uncomfortable and rough till the horse trots out sufficiently to enable the rider to rise. The action of the horse will so palpably point out to the rider the precise moment to rise in the saddle, that it is quite unnecessary to describe it. The faster the horse goes in the trot, the pleasanter the pace. Considerable difference, however, will be found in the action of horses:—some have a short quick step; others a long step, and consequently not so quick: the former are more pleasant to ride; yet the latter go well enough, if their action be light. But when a horse goes with a long, lounging, sluggish motion, as may be generally observed in carriage horses, they make unpleasant hackneys. Hence it may easily be perceived, that gig horses, &c., are very often but indifferent for the saddle.

In the trot, the action of the horse, assisted by a little effort of your own, should raise you from the saddle; and in this pace, your body should incline a little forward, which is the most graceful, the most easy, and the safest position.

The foot with which the horse leads is the one to which you are to rise; in fact, you cannot rise to the other; but as the action will be found more pleasant when the horse leads with the off foot, so should he lead with the near foot, you can easily rein him in; and, again, in pressing him forward, draw the left rein a little tighter than the other, at the same time pressing your left leg against the horse's side, a little behind the girth, and he will not fail to lead with the off leg. The rise and return of the body should be regular, easy, smooth, and even. In trotting, considerable pressure is made on the stirrup; but the knee should be firmly pressed, since the safety of the rider, in case of accident, depends mainly upon it. Should the horse happen to change legs, the rider must take the corresponding motion.

It will be found that the horse will take a support from the hand, corresponding to the pace which he is going; and the support from the hand should be firm, but easy, in pleasant accordance with the action of the horse. If he be curbed up too tight, he cannot take the requisite support, and is consequently impeded in his motion. But any person of common sense will be able to form a better opinion, in this respect, for himself than can be placed before his eyes upon paper.

Trotting I consider the pace best calculated for the road; it is the safest, as the horse is less liable

to stumble or fall, when trotting well out, than in any other pace. Moreover, it is less fatiguing to the horse than the canter, or short gallop. Yet, in going a journey, it is advisable to walk a little sometimes, as well as to canter, since it acts as a relief both to the horse and his rider.

The full gallop on the road cannot be recommended for reasons too obvious to need enumeration; but since there are persons who prefer the short gallop or canter to the trot, it may be requisite to say a few words on the subject. The canter is a pleasant, graceful pace, and generally said to be easier than the trot; though I prefer the latter for road-riding; but a horse cannot be so safe in the canter, as in the trot, unless he raises his fore feet high, which retards his progressive motion. The canter I consider as the ladies' pace, which I shall not fail to notice under the head *LADIES' RIDING*.

#### RUNNING AWAY.

It may be easily perceived that a horse given to running away, is not only an unpleasant, but a very dangerous, animal. However, it may be very truly observed, that if the horse has a proper mouth he cannot run away with a rider who possesses but a trifling knowledge of horsemanship. When a horse gets the mastery on the road, and runs away with his rider, the most dangerous consequences may be anticipated; and therefore a horse of this description ought never to be ridden on the road, at least till he has been cured of this pernicious habit—and even not then, unless by a good horseman.

Manege riders pretend that no horse can run away; and I am willing to admit that horses used for that description or branch of the art of Equitation could not, as the mouth of a manege-horse is rendered so delicate, that the most trifling force is sufficient to stop him. It must not be forgotten that a horse used for the manege is by no means calculated for road riding, as his natural, useful, and proper paces become thus utterly destroyed. More on this subject hereafter.

Horses properly broke, and ridden with a light and lively hand, will not become runaways; but, where, from improper management in breaking, or having been ridden for some time by heavy insensible hands, the horse's mouth becomes callous, he will, if a spirited animal, be apt to run away. The harder you pull, the faster such animals go. In such cases, the utmost exertions must be made to unite them; that is, pull them together for the purpose of shortening their stride or stroke, and thus ultimately stop them: this consists in repeated efforts to raise the head and get the haunches under them, which diminishes the power of the horse, and gives the hand the ascendancy. Bear on the stirrup, grasp well with the knees, and, having the reins separated, throw your body back with all your weight and strength, allowing your hands to assume a firm upward operation for the purpose of getting the horse's head up: the instant this is performed, bring the body upright, that the hands may be eased, and the following is the effect of the operation:—the throwing the whole weight of the body forcibly back, the hands at the same time raising the head, produces a considerable check upon the progressive force of the

horse, it shortens his step, and the body becoming instantly upright, the horse is deprived of the support he derived from the hand, which deters him from extending himself so freely as before, at least on the instant. Repeat the same process immediately, and the third or fourth effort will scarcely fail to bring the horse well in hand, so that you can completely stop him, if you think proper. Be mindful to leave as little interval as possible between your efforts, lest the horse should recover one check before you give him another—moreover, let the pulls be resolute and determined; and they should be so timed as to correspond with the step or motion of the horse.

When to the bridoon-rein is attached a sharp twisted snaffle, by sawing the horse's mouth from right to left, will generally stop him. It might be supposed that no horse could run away when he was well curbed up, the curb having a considerable length of branch; nor are there many that can. Yet there are horses, which, either by getting the bit in their teeth, and thus preventing its due operation, or by some other means, continue to acquire the ascendancy and run away. I once purchased a very fine bay horse at a low price, which was sold on account of his high spirit. He was certainly a very spirited animal, though very good tempered; but having been improperly broke and afterwards ridden by a timid horseman, he had become unruly, disposed to run away, and, from the state of his mouth, it was no easy matter to stop him. He was a very strong, powerful, horse, nearly thorough-bred, and, finding him unruly on the road, and even dangerous, as I happened to live on the coast, I took him down to the sea-shore at low water. There were miles of good hard sand in almost every direction, and he no sooner found himself on this marine savannah than he manifested every disposition to run away with the utmost violence: therefore, taking him firmly by the head (that is, taking firm hold of the reins, in both hands, separated) I allowed him to stretch away at full speed. He went with uncommon resolution and spirit for two miles or more, when I perceived him slacken his pace, and at the end of the third mile he would have given in; however, I pressed him mildly forward for about another mile, when he very willingly slackened his pace. On the following day I took him again to the same place, and he evinced no disposition to run away. But he started very spiritedly, on trifling animation, and I took him the four mile heat again. He never afterwards attempted to run away with me, but he was not to be trusted with a timid or unskilful rider.

Some horses will run away when too tightly curbed; their mouths are thus rendered uneasy, though the operation of the curb is destroyed, and they are enabled to effect their purpose.

When a person becomes possessed of a hard-mouthed horse, he may render him lighter and more pleasant in hand by riding him according to the instructions given in preceding pages; a light and lively hand renders a callous or hard mouth sensitive and susceptible of feeling. But, if it be wished to render the horse's mouth sensitive by other means, I know of none so effectual, easy, and consequently advisable, as placing him on the bit for an hour or two, or three, every day for a

week, or according to circumstances. The bit should be wrapped round with flannel or wool; the horse will continue to play with it, and it will have the desired effect. The head of the horse is of course made fast on each side; but the mode of placing a horse on the bit in the stable is too well understood by every groom and stable-boy to need description in this place.

At the first blush of the case, it may seem strange that a soft material, like flannel or wool, should render the mouth of a horse tender; but such is the case: it operates on the mouth with a degree of irritability or tickling, by which the lips of the horse are excited to continued motion, and the object is thus accomplished.

#### SHYING IN HORSES.

Having already noticed the affected shying of restive horses, it will be necessary also to mention that there are horses which either from timidity of disposition, or other cause, are very apt to shy on the road; and, on such occasions, the ignorant and the hot-tempered are very apt to have recourse to the whip and spur, which is the worst plan that can be adopted.

When a horse shies, he should be spoken to in a soothing tone, tapped on the neck, and allowed to look at the object of his alarm for some seconds. He will then approach nearer to it, and will pass it. Nor should he be pressed too close to it the first time, unless his alarm so far subsides by looking at it, that this can be done by coaxing, not by coercive means. If a horse shies at any particular object, a windmill, for instance, he should be treated in the manner already described, and, in addition, the rider should contrive to pass it frequently, and allow the horse each time to pause and view it, by which means he will not only pass it without notice, but may be ridden up close to the very sails. On the contrary, if, under such circumstances, the whip and spurs be fiercely applied, as is too often the case, it will add terror to the horse's already-excited alarm: he may be thus compelled to rush by it, while every time that or a similar object appears before him, he expects the whip and spurs: thus bad is made worse, and the horse perhaps spoiled, if he do not throw his rider.

When a horse shies with me, I speak to him soothingly, &c., and if I conveniently can, I pause and coax the animal till he approaches quite close to the object, and becomes convinced that he has nothing to fear from it. A horse, treated in this manner, will not shy again at any thing similar; further, if this principle be steadily and good-temperedly acted upon, the horse will abandon shying in a great degree, if not altogether. Let it be well remembered, that a shying horse is as different as possible from a restive horse: the former is remarkable for good temper and a very tractable disposition; the latter for cowardly cunning, and a most treacherous disposition.

It is cruel in the extreme to urge a horse violently, with steel and the lash, up to an object which terrifies him, when the business can be so much better accomplished by mildness and gentle treatment. Indeed, in the management of horses, coercion should never be applied but when it is rendered indispensably necessary.

Spirited horses, in high condition, will start at the sudden flight of a small bird from the hedge or any similar trifle; but, as there is not the least manifestation of vice in such an occurrence, the rider should not quarrel with his horse on that account: if he should be unwise enough to apply the lash or spur, the next time a similar circumstance happens, the start of the horse will be much more forcible, (as he expects the whip and spur again), and the rider may be thrown out of his seat—perhaps to the ground. Those who ride such horses should be prepared for little occurrences of this sort, and, at all events, not to suffer themselves to be irritated by them. The horse is an animal, which is grateful for kind treatment; and I never recollect riding a horse for any length of time that would not follow me in a very friendly manner. I never had one which kicked at me when I was thrown (as I have been many times when following the hounds;) on the contrary, when the horse has been uppermost, and been compelled to place his feet upon me, he has always borne lightly, and removed them as soon as possible.

It is no uncommon occurrence for young horses to shy at meeting stage coaches, and if they are improperly treated, they become troublesome and dangerous. A horse which is afraid of meeting a coach should be frequently ridden where they pass. He should follow and accompany them for some distance—when the coach stops, he should be ridden round it; and, when meeting it, he should not be urged near it; he should be uniformly soothed, and when (in a short period) he perceives he has nothing to fear from the object which excited his alarm, he will pass it as unconcernedly as possible.

---

**DUTY ON BRICKS.**—The eighteenth report of the Excise Commissioners has just been published. Their inquiries were directed to the excise duty charged on bricks, and we are happy to observe the liberal view the commissioners have taken on the subject. This will be best understood from the following extract from the concluding portion of the report:—"We beg leave, however, in conclusion, to repeat the opinion that under any modification of the system of charge or collection, or of the rate of duty, the tax on bricks will be among the most objectionable of the excise duties; first, because it is charged upon one of the most useful of our native manufactures: secondly, because the tax must in its operation be unequal and partial, from its being a charge on one kind of materials, from which others used for the same purposes are exempt—a partiality which becomes the more oppressive, when it is considered that the larger portion of the existing rate of duty has been continued in direct contravention of the stipulation which is understood to have been made at the time it was imposed: and, thirdly, because this tax, although strikingly heavy in respect to the value of the article upon which it is charged, bears no adequate proportion, either to the expenses of its collection, or to the number of persons who are in consequence subjected to survey."—We may state, that the duties collected on bricks in Great Britain, in 1834—5, amounted to 402,842*l*. We hope to have to congratulate the country soon, on the entire repeal of the duty on bricks, as it has been already done in the case of slates, tiles, stones, and other materials consumed in building.

---

The vines of France are said to occupy 4,265,000 English acres; the value of the produce of which is reckoned at 22,516,220*l*. per annum.—*Mirror*.

## COMMITTEE ON AGRICULTURAL DISTRESS.

Subjoined will be found some tables extracted from the report of the evidence which has been given before the Committee of the House of Commons upon agricultural distress. There are two which furnish the prices of Southdown wool and lambs bought at Weyhill through a series of years. They will be found interesting, as shewing the variations which have taken place. There is another well deserving attention, namely, the return of the amount of bones imported for the purpose of being used for manure. The astonishingly increased use of this article in England and Scotland will prove the high estimation in which this species of manure is held on particular soils. It will be seen that the value of the bones imported into England in 1821 amounted to £15,898. 12s. 11d.; while in 1835 it had reached £127,131. 14s. 10d. In Scotland, in 1821, the value of the quantity imported was £69. 17s.; whereas in 1835 it had increased to £28,215. 15s. 1d. The duty is *ad valorem*, £1. upon £100. in value, and was, for England, last year, £1,309. 10s. 9d.; for Scotland, £85. 6s. 8d. It seems trifling with the feelings of the Agriculturist to suggest any relief from the repeal of this small duty, but nevertheless as the business of the farmer especially in these times, consists of a minute attention to outgoings, we cannot but think that benefit would be derived from the removal of any impost which may operate either to raise the price of so valuable a means of improving the soil, or throw an obstacle in the way of obtaining an ample supply of the article. We find in that part of the evidence which we have been able to get through, that this subject is several times alluded to. Mr. John Houghton, an extensive farmer and receiver of rents, residing at Sunninghill, in the county of Berks, and occupier of farms in several counties, says, "unless it had been for the introduction of bones, thousands of acres of land could not have been brought into cultivation." He also observes, that bones were extensively used in Lincolnshire, on land which ten years ago would not grow anything. Again, he says in reply to a question, Q. "That Wold land before the bone system of husbandry was not worth more than 5s. an acre?" A. "It was not worth that." Q. "Since the introduction of that system about ten or twelve years ago, it has been worth 20s. or 25s?" A. "In some instances." For the information of those who are not acquainted with the use of bone manure, it should be observed that it is incidentally stated that bones will not bear wheat so well until after the land has been chalked, and that it is not found to answer well on a gravelly loam. There is another table furnishing the quantity of grain sold for a series of years; according to the returns made from the 149

towns by which the averages are regulated. It will be doubtless in the recollection of some of our readers, that Mr. Cayley stated at a meeting which took place in the latter part of the last year, or in the commencement of the present, that these returns when furnished would supply information as to whether the quantity of wheat brought to market had increased or not. We then took occasion to caution our readers against any reliance for such information upon so imperfect a source. The returns have been made, and Mr. Jacobs, who is Comptroller of Corn Returns, and from whose office the returns are obtained, has positively stated on his examination before the Committee, that no reliance can be placed upon them as furnishing a correct statement of the growth or the quantity actually sold, inasmuch as in many cases the same quantities change hands many times, and get returned as often.—*Mark Lane Express.*

**WHEAT.**—Account of the Total number of quarters of Wheat sold in each of the 149 market towns from which returns are made:—

The duty is 1*l.* on every 100*l.* of the value.

The price of Bones at present at Hull, is about 4*l.* 10*s.* per ton, so that the number of tons imported in the last year may be easily ascertained.

**COMMUTATION OF TITHES.**

**STR,**—Land subject to tithe must render one-tenth of the gross produce, if demanded; how is it, then, that much less than a tenth is taken by composition? There are many reasons?

First, If tithe in kind were generally demanded, the whole system would be abolished. Even in a small district of eight or ten parishes, if the occupiers of land received notice to set out their tithes in kind, the law would not be willingly complied with. Again, if tithe in kind were demanded, the cultivation of the land would be so checked that the tenth would not be worth so much as can be at present obtained by composition, under which the occupier feels himself at liberty to render his land productive.

The enormous expenses to which the tithe owner is subjected in collecting his tithes, and his liability to all the taxes consequent thereon, together with the hostility which such a system must inevitably engender, are sufficient reasons against a more general practice of exacting tithe in kind.

We, therefore, must come to this conclusion, that composition is more desirable to the tithe owner than taking it in kind, as there is no doubt the tithe in nineteen parishes out of twenty is compounded for.

Let us consider then how this great and difficult question can be arranged, so that justice may be dealt out to all parties: I have stated that, according to the present law, the tenth of the gross produce belongs to, or can be demanded by the tithe owner; to this the occupiers would not submit, therefore it cannot be taken. I maintain this position, viz., that tithes, although by law protected, cannot be collected in kind, if generally demanded.

What will you then resort to for the purpose of ascertaining what would be a fair settlement of the question? Will you take a portion of the rent, or annual value, on which to fix a rent-charge? I confess, from all my past experience, rent and tithe are two separate properties, and have not governed each other.

I am aware, to save trouble in valuing tithe, valuers have generally taken a portion of the rent of arable, and a portion of the rent of meadow, or pasture land, in lieu thereof.

Looking generally at the cultivation of the country,

you will find many occupiers of capital and skill very active cultivators of the soil, and for various reasons; I am one of them, for the express purpose of giving employment to as many of the labourers as I can, having always more than can be employed. Am I, then, to be fixed with a rent-charge measured by the produce of the last seven years, when a neighbour who has done but little with his land will have a smaller rent-charge, merely on account of his having bestowed so little capital and skill on his land? Therefore, to perpetuate a high rent-charge on industry, and a low one on idleness, or from any other such cause, must be manifestly unjust.

I am aware there must be what is termed "giving and taking;" but some cases will run so wide of each other, that the aid of some intermediate power must step in.

The most equitable principle to adopt as a rule for commutation (if the difficulties could be got over,) would be to take land in its fair proportions of arable and pasture, and the produce to be considered as in a moderate or natural state of cultivation, and not in an artificial state to force crops, as is now the case, which can only be done by valuation and under particular directions, and this may be found inconvenient. In respect to a permissive clause, I have no doubt but that many private agreements will be made; but whatever time is given for this purpose, the shorter the better, as none will be entered into until the last moment, and then only by those tithe and land owners who are moderate in their demands; all the extreme or hard cases which require immediate settlement, will be left out. Undoubtedly this is a difficult question to adjust permanently, and to do justice to all parties interested; but however great the difficulty may have become, it will continue to increase, and the subject be rendered more intricate. Look at the effect produced by the poor Law Amendment bill; from the short experience we have had of it, the poor's rates are already reduced from thirty to fifty per cent., this in other words is an increase in the value of tithes, the system of managing the poor's rates being now taken out of the hands of the occupiers of land; and the power of defending themselves against the tithe owner who sought to exact the last shilling, which they before possessed, is now suspended.

Is it just to the labouring man that tithes should remain a restrictive law against cultivating the soil actively when relief is refused to him; and is it not injurious to the best interests of the kingdom that there should be any check put upon the productiveness of the earth? We will now examine the position of rent as compared with tithe since 1792. I happen to be in a situation to know how these two properties have gone on together. In a considerable district one hundred pounds rent in 1792 amounts to now, on an average, one hundred and forty pounds. The increase of rent on the good land has been more, but the increase on the poor land has been less. One hundred pounds tithe in the same district in 1792, has increased under composition from that sum to at least two hundred and forty pounds per annum; this will not surprise a practical man; the fact is, agriculture is rapidly increasing in cultivation, although the poor land will leave little or no surplus for rent; a great cause is, an increased population of labourers, and the hope of some greater future prosperity.

When you consider how tithes have increased on rents since 1792, up to the present time, and look at the present increasing population, it must be perfectly clear that in a few years the tithe of all the poorer soils cultivated will be of more value than the rents; this shows the necessity of adjusting the matter.

In reference to the increased value of tithes arising from a decrease of poor's rate, I must here observe that, within the last forty eight hours I have received a notice to set out my tithe in the parish of Winchelsea, by the Rev. James John West, the rector; I have not the least doubt that the step has been adopted in anticipation of the extra value which the tithe will assume in consequence of the poor's rates in the parish being reduced from 18*s.* in the pound to 6*s.*, and I admit his right so to do; however, I am but a very small occupier in

this parish. Now let us see if any means can be devised to assist the settlement of this all-important question. I have been of opinion from the commencement that reference to gross produce must be abandoned. In the first place, it is not to be ascertained; in the next, if it could be brought about, it would be unjust, because the occupier would be found in a higher state of cultivation than he ought to be, having cultivated his land under composition.

With all the consideration I can give to the subject I have arrived at the following conclusion, viz., that compositions paid, or agreed to be paid, for the last seven years, leaving out many cases which will appear to require some alteration both by the occupier and the owner, such as an extreme cultivation or extreme composition, whether high or low, should be investigated by an appeal to the commissioners, who should have power to call in assistance to adjust any difference or difficulty that might occur. With regard to composition made and agreed to by both parties for the last seven years, who is to say they have not been fair and satisfactory, and that such a mode of proceeding is not the best, and only fair rule, to govern the rent-charge? subject as before, to an appeal in particular cases, and these will adjust themselves if power be given to the commissioners to regulate them. When you have ascertained what have been the compositions for the last seven years, and have regulated the extreme cases which will be found easy by practical men, a question will arise whether the owner of the land is not entitled to some considerable abatement on account of the better security given to the tithe owner; I am of opinion the tithe owner can afford to make a considerable deduction, having collected tithes myself: I have always met with losses, and occasionally they have been heavy. With reference to hop-grounds, I trust that as a very considerable outlay of capital must unavoidably be expended on them, at any rate, the present arrangement will immediately stop tithes in kind proceedings; the compositions of such parishes as are adjacent to those in which tithes are taken in kind, should guide the value of composition to be levied in lieu of tithes in kind.

In conclusion, I beg to observe, that in my opinion the foregoing plan is calculated to adjust the question of tithes more fairly than any I have yet seen; and as some cases will be found to require a special regulation, I am sure no general measure can be satisfactorily adopted without providing in some way for the extreme and exceptionable cases.

I am, Sir, your obedient humble servant,  
SAML. SELMES.

Beckley, Sussex, March 25.

## MEDAL IN HONOUR OF THE LATE SIR JOHN SINCLAIR.

"Ye generous Britons venerate the plough."—THOMSON.

We need scarcely say that the suggestion conveyed in the following letter has our most cordial approval. Any one who has seen the 400 medals struck in France, in the reign of Napoleon, will admit that a cheaper and more beautiful way of making imaginative Art minister to the immortal honour of valour in the field, or wisdom in the senate, or patriotism in directing national industry, cannot well be conceived. Let D'Israeli speak:—De Serres, in 1559, composed a work on the cultivation of mulberry trees, in reference to the art of raising silkworms. He taught his fellow-citizens to convert a leaf into silk, and silk to become the representative of gold. Our author encountered the hostility of the prejudices of his times, even from Sully, in giving his country one of her staple commodities; but I lately received a medal recently struck in honour of De

Serres, by the Agricultural Society of the Department of the Seine. We are too slow in commemorating the genius of our own country, and our men of genius are still defrauded of the debt we are daily incurring of their posthumous fame. Let monuments be raised, and let medals be struck! They are sparks of glory which you scatter through the next age!" Monuments are not so easily raised; but they are by no means the sole mode of perpetuating glory, or of rousing emulation. It may even be questioned whether, in this respect, they are more influential than medals. They are more imposing, certainly; but then they are fixed, and cannot, like medals, be circulated into every household, there to add fire to the fire of rising genius. Why in this country are we so chary of sowing the land with these "sparks of glory," the immortal seed of emulous virtue? We hope the Highland Society of Scotland will do themselves and the country honour, by giving us a noble medal of the patriot Sinclair, at whose call Plenty sprung from our rough soil,

"And leapt to life with her redundant horn."

For no other man proposed to be thus honoured by a medal could more beautiful devices be so easily found, drawn from the feast of sheep-shearing, and "the days of the wheat and barley harvest?" Here at once, from old Homer, are some pictures that would do for the reverse of the medal. We transcribe from the shield of Achilles; and the reader who feels not that the simple things of nature are the same in all ages deserves not to eat wheat from the fat leas of Nithsdale.

"And in it he made a soft fallow, a fertile arable land, spacious, thrice worked: and many ploughmen in it, driving their oxen, turned them this way and that. When the ploughmen after turning came to the end of the field, a man was ready to put in their hands a cup of honey-sweet wine; they accordingly turned their plough along the furrows, being eager to arrive at the end of the fertile field. And it (the field) grew black behind them, and was just like a ploughed field, though made in gold: this indeed was a marvellous piece of workmanship.

"And in it he made a field with high standing corn, and reapers were cutting with sharp scythes in their hands; while some stalks were falling on the swathes close after one another on the ground, the binders were fastening others up in sheaves. The sheaf-binders were three, and behind them children collecting the corn in bundles, and carrying it in their arms, continually supplied the sheaf-binders. Among them stood the lord in silence, on a swathe, with a staff in his hand, well pleased. In another part of the field servants were preparing a repast under a tree, and they were dressing a large ox which they had killed; and the women were preparing supper for the reapers, and were kneading much white meal.

"And in it he made a herd of oxen with upright horns; and the cattle were made of gold and tin; and with lowing they were moving from the stall to the pastures, along a murmuring brook, by the rustling reeds. Keepers of gold were following the herd: four keepers and nine swift dogs with them. \* \* \*

"And in it skillful Vulcan made a place of pasture, a large pasture for white sheep in a beautiful valley; he made both folds and huts for the shepherds, and pens with roofs.

HERE FOLLOWS—THE KIRN?

"And in it skillful Vulcan made a dance like that which Dædalus once made in spacious Gnossus for Ariadne with beautiful hair. Three youths, and virgins to be bought with large dowries, were dancing, holding one another by the hand: the virgins were clothed in fine linen, and the youths in well spun vests, smooth and shining like oil. And the girls had beautiful chaplets on their heads, while the youths had golden knives

fastened with silver chains. At one time they would move lightly with their feet (running in a circle) just as a potter who is seated tries the wheel well fitted to his hands, to see if it will run; at another time they would move in lines towards one another. And a large crowd delighted stood around the happy troop, while two active dancers among them began the song, and moved quickly in the midst."

But now for the letter:—

(To the Editor of the *Dumfries and Galloway Herald*.)

SIR,—I was very much pleased with the brief but comprehensive terms in which, last week, you characterised the important services done to his country by the late Sir John Sinclair. My immediate object in writing to you at this time is to give, through the means of your paper, which is read by so many landed proprietors in these southern districts of Scotland, a hint to the agricultural public, of the propriety of having a medal struck in honour of the patriotic Sinclair, to whom we are all so much indebted for the development of our national resources. If conquerors and mere men of letters are judged worthy of so much of a people's gratitude as to have costly monuments erected to their memories, how much more worthy is he who, by his example and instructions, and unwearied exertions, has taught his country to grow in all useful knowledge, to put forth her energies to bring plenty from her soil, to extend her cities, to fill them with inhabitants! Sir John Sinclair amply deserves a monument from his country. But whether or not this can be easily obtained, it is at least a thing of no difficulty to strike an appropriate medal in honour of his important labours, and thus allow simple husbandmen, like myself, a cheap opportunity of possessing a memorial of a man whose memory we, especially, are bound to venerate. I trust the Highland Society will take the hint, and manage the thing in a way that may do honour to Art, and satisfy the grateful respect of our swains, for the memory of such a patriarch and patriot as the late Sir John Sinclair.—Yours, &c., A FARMER.

ADAPTATION OF THE CURRENCY TO THE RELIEF OF AGRICULTURAL DISTRESS.—THE LATE LORD SONDES.—The last moments of this noble-minded peer were distinguished by the peculiarity which characterized his walk through life. Few individuals, perhaps none, ever looked on the "pale messenger" of death with greater composure or more manly firmness. On the morning of the day he died he intimated to his surgeon the prudence of tapping; and when informed that the operation would endanger his life, he exclaimed, with much emphasis, "What! tell me whether you think I shall outlive the day?" "I fear not," answered the surgeon. "Do you (he then continued) think I shall live an hour or two?" "That is doubtful," responded his attendant. "Then call Milles" (the present Lord), on whose appearance he coolly said, "Milles, I am off, you succeed me here." After this he made several legacies to the amount of 7,400*l.*—to his surgeon, three or four of his tenants, and house-keeper, with 500*l.* to his nurse (a Canterbury woman). Desiring some wine, it was handed him, when he said, "You'll soon follow me; may God forgive me my sins and all of yours. I hope we shall meet in a better world." Shortly afterwards, the wine reviving him, he turned round and exclaimed, "Death is a long time doing his work, is he not?" He expressed to those around the consciousness of feeling perfectly happy, and was occasionally heard to repeat certain portions of Pope's celebrated hymn, "Vital spark," &c. To those affected to weeping, he said, "What are you crying for?—don't weep for me—I am happy!" A few minutes before his decease he was removed from the bed to his chair, where, about half-past 8, supported by his nurse, he quietly breathed his last, without a sigh or groan. In addition to numerous legacies left by this truly charitable and munificent nobleman, his lordship's last bequest was a year's rent to each and every of his tenants. The amount is said to be about 30,000*l.* Several of the tenants will be thus benefited 1,000*l.* and 1,200*l.* each.

## BURNT SOIL AS A MANURE.

TO THE EDITOR OF THE IRISH FARMER'S AND GARDENER'S MAGAZINE.

SIR,—I have often endeavoured to impress on the minds of farmers, the great value of burnt clay as a manure, and as the season for preparing it has now arrived, we will refresh their memory on the subject; and here it may be necessary to observe, that the preparation of the soil for this purpose is very different to the usual practice of "paring and burning," which, on some lands, is most injurious; whereas, making manure of waste headlands or subsoil, and carting it on those that are shallow or exhausted, improves and fertilizes the latter, and brings them into profitable action. It is generally admitted that ashes are most active manure; but in producing them off thin soil, its staple is much reduced; and notwithstanding two or three crops may be forced in this manner, yet the deterioration which the land afterwards suffers will ultimately reduce the profit which such a system of manuring may produce.

There are also other advantages in using burnt soil, or sub-soil, for manure, namely—it can be produced from land dissimilar to that which is to be dressed; and the effect will be likewise more lasting than ashes in promoting vegetation for a succession of crops.

Burnt soil is a good manure, on the same principle that ashes are, because it has gone through the process of ignition, and, consequently, strongly impregnated with oxygen and hydrogen, which is the food of plants. No doubt some vegetable matter, in the process, is dissipated, yet what remains is brought into a fitter state to promote active vegetation. However, in cases even where there is but a very small proportion of vegetable matter contained in the soil thus prepared, or even should it be a *caput mortuum*, yet, by putting it through this process, it will become most fertilizing to the soil on which it is applied. I have tried it for potatoes, Swedes, and the common turnips, at different times, with the greatest success; and in some cases I have found these crops more productive than when manured with farm-yard dung. It will require one hundred cart loads an acre for either of the two former crops; but seventy will be sufficient for the Norfolk, globe, or store turnip. If, however, one-third of well-prepared dung can be blended with the heap, about a few weeks before it is applied, for potatoes or Swedes, it will insure a more productive crop on light soil. On strong and deep land I have found this unnecessary.

The following is the simplest mode of performing the process, when grass headlands are to be burned:—

Dig a hole about four or five feet in diameter, and two feet deep, nearly on the centre of the land to be stripped; cut four narrow flues, five or six feet long and nine inches deep, to communicate with this hole, and cover them with strong sods; fill the hole with brushwood, three feet high, and over this strong loppings of trees; on the top of this, and all round the brushwood, place large blocks of wood, or stumps, well dried, in such quantities as to produce a strong fire. A day or two preparatory to this, let a large quantity of sods be cut about six inches thick, and of a middling size, and on the fire being sufficiently kindled, which it will probably be in half-an-hour, place the sods round the fire and on the top, till it is quite smothered down—observing at the same time to keep the flues opposite the wind open, and

the others closed. When you are satisfied that the strong timber has well taken fire, put on the sods as fast as possible—for this is the critical time to keep in the heat. In order to do so, the smoke should not be permitted to escape freely. It must be recollected, that the object of thus preparing the soil, is not to reduce it to ashes; but to sweat it—if I may use a common, but a very strong expression, in order to explain myself. A kiln of twenty or twenty-five loads, may be nearly finished in a day, but will continue burning for a week, or more, and will require to be dressed daily, morning and evening with sods, in order to keep in the heat and smoke. When cool it should be turned over and chopped, if intended for potatoes or Swedes; but if for a late crop of turnips it is better to cover the heaps with soil, in order to preserve their fertilizing properties till wanted.

This preparation of headlands is much more economical and beneficial than if dug and mixed with lime: and in cases where the soil is not sufficiently adhesive to cut into strong sods they may be managed in the following manner, viz.: dig a trench seven or eight inches deep, and about two yards wide, in the centre of the headland to be prepared; get some turf or coal, and kindle it in a place convenient, and when lighted divide it in the place excavated into small heaps at four or five feet asunder, and to these add some fresh coal or turf; if the latter, a larger quantity will be necessary. When this is lighted cover the entire with sods or adhesive soil or subsoil about eighteen inches high, to the width of the trench, which, when the fire appears to come through, give the surface a dressing of half an inch of culm or strong cinders, and on this you may lay on the soil from the headland, even if it does not adhere firmly; for at this time the fire of the kiln will be sufficiently strong to force its way through and light the layers of culm as they are laid on alternately until the heap rises five or six feet high. If the smoke comes through the soil that is laid on it is sufficient, and the slower it burns the less the heap will be reduced, and the manure produced will contain more fertilizing properties than if quickly burnt to ashes. These kilns may be made of any shape or size most convenient, provided the principle stated be observed and practised.

For potatoes or Swedes, it is advisable to put this manure into drills under the plants or seed; but for late turnips harrowing it in broadcast will answer. The subsequent corn crops I have always found equally productive and of better quality than off land prepared with farm-yard dung. Was it not that I should trespass on your pages, I could state one hundred experiments made in the use of burnt soil to corroborate this assertion,

I have adopted the term *soil*, instead of the more usual one, *clay*, lest it might be supposed that clay soil alone can be thus prepared. There are, no doubt, some soils which cannot be beneficially put through this process, especially such as are too silicious—but there are but few farms on which soil or subsoil cannot be procured fit for the purpose.

AGRICOLA.

*Collinstown, March 22, 1836.*

## ON BONE MANURE.

BY MR. M. M. MILBURN.

(Continued from page 294.)

We have frequently heard it raised as an objection to bone manure, that it affords no fertilization to any

crop after that of the turnips to which it is applied. To this it may be answered, that the object of the turnip farmer is to realize a crop of turnips, which being eaten upon the land by his sheep, is the very best management for securing plentiful succeeding crops of corn and seeds. Objectors to bone manure sometimes say, that it is more the natural fertility and good condition of the soil itself, that produces the turnips, than the bones laid upon it, because all the food which the bones can convey to the plants is not sufficient to have any considerable influence on their growth, in the quantity in which they are generally laid on. The practical farmer however can easily refute this. If when they are drilled the machine is obstructed by any accident, while the seed continues to be sown, it will germinate and spring up like the rest, but in a few days the plants will dwindle and die away, while on the very next seam, where the seed and bones dropped together, the plants will be healthy and luxuriant. But of this subject more afterwards. Another advantage of bones may be stated, which is a very valuable one on light soils. The vigour and health which they cause in the plants, as well as the regularity in which they grow, cause them to cover the ground by far more perfectly, than when sown with ordinary manure. Every farmer well knows, that the interstices between the rows of turnips sown with farm-yard manure, will sometimes in spite of all his carefulness, remain uncovered, and then weeds, and that pest of all light soils quitch, will be encouraged, and impoverish the soil, and in the freeing from which, nearly all the labour of the light-soil farmer consists. The superior luxuriance, regularity, and rapid growth of turnips sown with bone manure, prevent the weeds and quitch from making any progress, so that even cleanliness considered, they will possess the advantage. It would be unfair however to look at one side of the question without the other. I am not quite sure, whether they do not encourage that destructive grub the wire-worm. A field never known to grub, was sown with bone manure; the plants came up healthy and vigorous, perhaps more so than had ever been previously witnessed, but they went off completely by the wire-worm in the month of August. I do not say that this isolated instance should be set up as a proof of their always producing similar effects, or even always producing them on land predisposed to grub, but the fact that wire-worms were found adhering to the skull, and under the hair of the celebrated Hampden when he was disinterred, seems to indicate that bones have some attractions to that destructive insect.

To make a farmer, requires judgment, experience, and decision. The dearly-paid-for credulity of some theorists has produced the general jealousy of, and prejudice against, any newly discovered improvements among the farmers as a body, for which they are remarkable. I remember a circumstance which occurred some years ago, which tended very much to prejudice the minds of the neighbouring farmers against the use of bones as a manure. A gentleman farmer had it intimated to him that abundant crops of turnips might be procured by the application of bones. Braving a thousand difficulties, he purchased whole bones by the bushel; employed a number of labourers to break them in pieces, and laid them on the land, sowing them broad-cast. The result was a total failure of his crop, no little to the amusement of his neighbours, who joked and laughed heartily at his "whim," for the next season he carried his revenge so far against them for the loss of his crop, that he actually had all that could be seen, gathered off the land. Now a little reflection would have ac-

counted for all this. The bones had not been broken sufficiently small, to cause them to decompose readily, and what would cause them still more to resist decomposition was, that they were recent ones; besides the turnip plants had no regular and direct communication with the bones, so indiscriminately scattered over the furrows, and part, and a very considerable part, never coming in contact with them at all. I mention this circumstance, not to expose the ignorance of the individual or his want of judgment, for this occurred at a time when as a user of bone manure he stood alone, at least in the district in which he lived; but the practical man may gather much information from this failure. *The seed must come in contact with the bones*, and all the bones that do not, may be considered as wasted, so far as the turnip crop is concerned. The practice when they were first introduced was, to sow them 'under furrow,' or before the land was ploughed, and then sow the seed with the plough-drill, the same as with putrescent manure; this occasioned much waste, and the plan of drilling the seed along with, and upon the bones, is now almost universally adopted. Some however object to this, on the ground that the plant receives as much and more nourishment, from the side fibres, than from the tap-root; quite forgetting, that while by the broad-cast method, there are one-sixth part of the bones which the side fibres never reach; the drill method ensures a supply to all the spongy parts of the plant, no matter in what direction they may extend. A manifest difference however exists, even in the modes of drilling; one method is to plough up ridges at about eighteen inches distance and drilling the bones and seed in the same ridge, which of course requires them to be done singly: the other of harrowing the land level, and making undulations in the ground, by means of colters fixed to the machine, into which fissures, the seed and bones are dropped; the land is then harrowed over. The latter plan has all the advantages attending it of retaining the moisture in the ground, in a droughty season, and thereby accelerating the growth of the plants, as well as of completing it much more readily, than by the hand-drill method; but should the crop be destroyed by the fly, there is all the advantage by the former method, of again sowing the seed upon the bones, and thus having every prospect of a second crop, which you are deprived of by the horse-drill plan.

With respect to the size of the bones, much depends upon the circumstances of the case. If immediate and powerful nourishment is the object, 'dust' would be advantageous, but it must always be taken into the account that it is generally much adulterated, for which it affords facilities which the larger sized bones do not. Should more permanent advantage be desirable, it would bespeak "half-inch," which when sown with ashes, is perhaps the best size for general purposes. Many opinions have been offered as to the permanent effects of bones upon the soil, some contending that there is not sufficient weight of nourishment, in the quantities which are generally laid on, to produce any permanent effects; others that the bones are not nearly all decomposed the first crop, and that when re-exposed to the action of the atmosphere, by repeated ploughings, the fermentative and decomposing processes again take place, and of course are beneficial to the crop next sown, and which I am rather inclined to think is the case, but be that as it may, so far as the turnip crop is concerned, they are invaluable, and when that is secured, as has been already adverted to, it is one of the best dressings the land can have. Chemistry, furnishes us with the most vague and unsatisfactory theories respecting this, and were it not that practice

has decided bones to possess qualities which chemistry cannot, or has not developed, we should be at once lost in uncertainty. A writer in the Quarterly Journal of Agriculture, No. 3, vol. I. p. 49, gives the following analysis of the best bones; in 100 parts there are of—

Earthy and saline matter. . . . .	40	} parts.
Cartilage and jelly. . . . .	40	
Fatty matter . . . . .	20	

But he even admits this unsatisfactory, for he says, "The quantity allowed per acre, is not usually more than 10 or 15 cwts, of which not more than one-half is efficient as manure and this is but a small portion of the weight which we carry off the field in regular produce." But what cannot be chemically accounted for, is no less true in practice. With respect to permanent effects, I may state a fact which was communicated to me by a respectable and intelligent young farmer, and which I related at the last meeting of the Thirsk Agricultural Association, but will nevertheless mention it here. Half of a field was manured with farm-yard manure, and half with bones, and sown with wheat. No perceptible difference occurred. The succeeding clover crop was mown, but no difference still;—the second crop was also mown, and that grown on the bone manure was considerably better. The whole field was turnips last year, and all manured alike with putrescent manure, but that half of the field which was *three years before* manured with bones, was at least worth twice as much per acre as the half which was manured! Another corroborative circumstance occurred under my own observation. Part of a field was sown with turnips, and boned in 1834, and part adjoining with Swedes and stable manure. This was a thin sandy soil. The boned turnips grubbed completely off, and the field was ploughed in October, and sown with barley in the spring. The crop it had preceded the turnips, was a white one, and nothing but bones were used, nevertheless the barley crop exceeding anything ever grown upon the land before, while that which followed the Swedes was as usual poor. These facts I think furnish most convincing proofs that they not only exercise an influence on the land independently of the sheep-soil left by eating the crop, which chemistry has not accounted for, but that that influence is permanent, and not only in stimulating, and maturing the first crop, (which was done in the latter instance until the month of August,) but in sustaining the succeeding crops. It would be well worth investigation as to *how the bones act as a manure*, which I should be glad to see taken up by some of your agricultural readers.

Thorpfield, near Thirsk, Yorkshire, Mar. 30.

**NEW PLOUGH.**—Mr. Thos. Sheriff, Westbarns, East Lothian, has invented a plough, for which he has been awarded a premium of five guineas by the East Lothian Society. The property of this implement is to cultivate the sub-soil, in opposition to the system of trenching, which was lately introduced into East Lothian, and the tendency of which was to turn down the rich vegetable mould, and raise up the subsoil, in many, nay, in most cases, always the inferior. Its construction is simple, and every common plough can be converted into a subsoil plough at pleasure, and at a trifling expense. It is only calculated to operate successfully on a subsoil which does not afford much resistance; but a plough has been invented in Stirlingshire, which, with a proper application of strength, will cultivate the most stubborn clay subsoil that exists.

## THE CENTRAL AGRICULTURAL SOCIETY.

(From the *Veterinarian*, April 1, 1836.)

The two last have been important months as it regards the veterinary surgeon, and those with whose interests he ought to be identified. On the 8th of February, a committee of the House of Commons was appointed—unfettered, unrestricted in the slightest degree—to inquire into the existence, the extent, the cause, and the remedy of agricultural distress. It is true that the leader of the House of Commons gave no hope that “the distress which now pressed upon the agriculturists could be suddenly or effectually removed by any legislative interference of parliament;” but when he has left the inquiry into the matter as free as air, and expressed his wish that “the question should be fairly sifted,” and deliberately pledged himself that, “if there were any practical means by which agriculture could be improved, it would be the duty of parliament to adopt them,” the agriculturist needs not to abandon himself to utter despair.

On the 12th, the second meeting of the Central Agricultural Association was held. It was even more numerously attended than the first, and delegates from no fewer than 58 country agricultural associations were present. Universal satisfaction was expressed at the promise by government of an impartial inquiry into the causes of agricultural depression, and there was a deep feeling that all practicable redress could not be refused without injustice or delayed without danger pervaded the whole assembly.

If the language of the speakers generally was somewhat strong, their own interest in the affair, and the appalling instances of distress which crowded upon their view, whatever part of the country they inhabited, would form a sufficient excuse. This was no time for “sweet words, low crooked curtsies, and base spaniel fawning.” It could not, however, be denied, that there was a violence of manner—a studied obtrusion of demands that never could be granted—an ill-concealed irreconcilable ill-feeling towards those whose impartial consideration they besought—a hint, a threat of possible convulsion and revolution—a studied adoption of measures which must unavoidably lead to the defeat of their professed object, which alarmed the considerate, and excited the suspicion that much more was meant by some of the speakers than met the ear.

On the 18th of March the general committee of the society met in order to report progress, and to take into consideration the measures of government then under discussion in parliament, so far as they bore upon the agricultural question. The tithe bill formed a prominent object, and the average of the last seven years' produce was pronounced to be unjust and oppressive. All this was fair, and the matter deserves serious inquiry; yet the language of sarcasm and contempt, of menace and abhorrence, which was resorted to, was at least in bad taste, and would be adopted by an enemy to the agricultural cause, *in order to ensure its defeat*: and when, coupled with this the invidious distinction was drawn between the agriculturist and the commercial man, and the capitalist and the fundholders were held up as objects of detestation—when the old visionary project, the alteration of the currency, was studiously placed in the foreground, and broadly stated to be that without which “they would not be satisfied, and the refusal of which would be followed by revolution,” the honest and considerate well-wisher to their cause began to be alarmed and disgusted. The depreciation of the currency! the virtual destruction of every contract

that has been entered into for the last seventeen years, and the robbery and destruction of at least one of the parties—the robbery (scarcely denied even by the currency man) of the public creditor—the commencement of injustice in every department and in every form, without the reparation of any one former injury; when this, at length, is brought forward as an object, not of consideration, but as “a demand which must and shall be granted,” why then it behoves the prudent man, and the well-wisher to the agriculturist and to the country, to look around him.

But why, ask some of our readers, why this in a veterinary periodical? Because the agricultural question is one with which the veterinarian has much to do—because, in all but our large towns, and there too in a considerable degree, he is identified with the weal and with the woe of the agriculturists—because he has to do with the usefulness and the very existence of the most valuable part of the property of the agriculturist—because, as was stated in a former number, this very society has plainly and fully recognized the association between the farmer and the veterinarian, and has talked of adopting means to render that association closer, and more beneficial. We therefore have a right to mingle with this society, and to concern ourselves with all those questions which implicate its prosperity, or its utter uselessness and downfall.

The veterinarian is no uninterested spectator of the present contest; and if he can aid in the accomplishment of the ostensible object of the agricultural society, he will be honourably employed. If he has the power to direct and to confine the efforts of the farmer to the accomplishment of the objects which lie within his reach, and to warn him from those on which all his labour would be thrown away, or which, if obtained, would be delusive and unjust, he will be doing much good.

Government can do something;—the commutation of tithes being effected (the present bill probably being somewhat or materially altered in its calculations and its averages), the duty on the sale of landed property, and some taxes pressing particularly on the agriculturist being repealed. The landlord can do more, by the reduction of rent, in many situations at least, and to a certain degree; and by regulating his rent by the price of corn, or of some other farm-produce. The farmer—and aided by the government, which to a considerable extent may readily find the means of doing this—the farmer may do more, by making himself better acquainted with those sciences which bear upon the agricultural pursuits; by adopting cheaper and securer means of raising the produce of the ground, and securing it from many a source of injury, or even destruction. The veterinary surgeon may contribute to the same important end much more than the farmer has hitherto thought him capable of doing, and far more than the majority of practitioners have dreamed of his being able to accomplish.

One cause of agricultural distress, and not the least, and occasionally bearing heavily indeed upon the farmer, is the mortality among his cattle and sheep. Few of the domesticated quadrupeds are suffered to die of old age; but says the author of “*A Treatise on Cattle*,” in the first page of his work, “A tenth part of the sheep and lambs die annually of disease, and at least a fifteenth part of the neat cattle are destroyed by inflammatory fever and milk fever, red-water, hoose and diarrhoea; and the country incurs a loss of nearly ten millions of pounds annually.” This calculation was the result of much diligent inquiry, and was purposely under rather

than over stated. A committee was appointed in 1833 to inquire into the state of agriculture at that time, and the following was the evidence given as to the ravages of one disease alone, *the rot*, in certainly a very bad winter, 1830.

Mr. W. R. Brown, of Broad Hinton, says, that he lost 500 sheep in four months, and that he sold 400 more at 3s 8d a piece; so that he might be said to have lost 9 00 in all, out of a flock of 1400.

Mr. W. Simpson says, that one of his neighbours lost all his sheep but three. Mr. John Buckley says that many lost all their flocks. Mr. John Western Peters states, that he knew some instances in which the farmer lost the whole of his stock, and bought a second stock and lost that too.

Mr. Smallpiece asserts, that in some parts of the Wealds of Surrey and Sussex, where there used to be two or three thousand sheep, there is not one now. He adds, "the loss extends beyond the mere value of the sheep: it embarrasses the whole operation of the farm, and throws it out of cultivation."

In consequence of this there were in Smithfield, during 1833, five thousand sheep less than the usual average number on every market day, and 20,000 less than the usual number at Weyhill fair.

Mr. John Cramp, of the Isle of Thanet, adds, "in 1824, I had improved my farm at Ashford, in the Weald of Kent, and I had a great stock upon it; but in the ensuing winter I was visited by that dreadful disease the rot, which carried away 3,000 worth of my sheep in less than three months, and I gave up my farm.

Of the truth of the assertion, then, that the mortality among farming stock is one cause of agricultural distress, there cannot be a moment's doubt; nor can there be a doubt that it is an evil which to a certain extent admits of remedy.

What has been the case with the horse? Opportunity has been given to study well the nature and the causes, actual and predisposing, and the proper treatment, of his diseases; and, as has again and again been proudly and truly asserted, many diseases most frequent and most murderous have in a manner disappeared, and hundreds of thousands of pounds have been annually saved to the cavalry service and to the country. The success of the veterinarian in his treatment of the horse is a pledge of what he would be able to do were his education and opportunities the same as it regards neat cattle and sheep. We state without fear of contradiction, that the number of deaths from inflammation of the lungs, staggers, glanders, is not one-fourth part of what it was forty years ago; and there is no reason to doubt that the diseases of cattle and sheep would diminish fully as much in number and in fatality if equal opportunities were afforded for obtaining a correct knowledge of their nature and causes.

We are not wandering, then, from the legitimate object of our periodical when we occasionally notice the professed object and the real progress of the great agricultural society lately formed. Statements like those which we have made are intimately connected with the prosperity and honour of our profession; and the time is not far distant when veterinary science will proudly assume her true station as identified with the vital interests of the country.

Let veterinary surgeons coalesce with the district societies around them, and let them use the little interest which they possess in preventing the noble objects which such societies, properly conducted, can accomplish, from being sacrificed by the demand of that which it would be neither honest nor possible to grant, and by covertly making their assemblies the engines of political faction.

Y.

## ON THE DIFFERENT MODES OF IMPROVING THE SOIL.

BY M. PUVIS.

(Translated expressly for the Farmer's Magazine.)

THE USE of ASHES is very great in the extent of Argilo-silicious earths between the Rhone and Saone; reaching from the gates of Lyons into the departments of Létin, Saone-et-Loire, Jura, and Haute Saone. Lyons having supplied lye-ashes to the agriculturists of its vicinity who use large quantities, disperses them by means of its rivers to their banks and the adjacent countries, where the price runs from 1fr 50c to 3fr per hectolitre.

The usual quantity for a dressing is not so great elsewhere as in the neighbourhood of Lyons; it is about 20 or 30 hectolitres per hectare; they are in these parts spread upon the land before seed-time. The earth and ashes should be perfectly dry and they allow them to dry upon the land for twenty-four hours if possible, and then plough them lightly in. Ashes are also used very frequently for buck wheat upon fallows, in the month of June; they make sure of the crop, and also of the wheat and rye to succeed it. The effect of ashes is very slight after two years, when they alternate them with dung, as it is found better to use them only once in four years. Near Lyons they are employed upon maiden lands, in large quantities successfully, as much as 50 hectolitres, per hectare; the effects of this proceeding continue a long time; also upon their tilled lands they use great quantities; indeed such as it would appear are warranted rather by the lowness of price than the wants of the soil; the price here being 1fr to 1fr 50c per hectolitre.

In La Sarthe ashes are very dear and much sought after; they are employed conjointly with lime; to which, however, they are preferred for light soils; the quantity used is about 12 hectolitres per hectare: the excellent effect is shewn in the crops of buck wheat and of white wheat produced.

In L'Indre they are more particularly used in raising rapeseed; in dressings of twenty hectolitres to the hectare, and with this manure only from 20 to 30 per hectolitre per hectare are obtained.

Ashes are more frequently used alone, without other manure; but where their value is best known, as well as their price greatest, they have been recognized as acting more effectually when joined with dung, the effects of that being also increased; as also in the case of marl and lime; the fertility of the soil being much greater. In a commune near Louhans, (Saone et Loire), they make use of ashes more especially for wheat; they add half the usual quantity of dung to 8 or 10 hectolitres of ashes, and the effect produced by this mixture yields more than an average crop. In the commune Saint Etienne, near Bourg, they adopt a somewhat similar plan; the dung gives them opportunity of keeping a cold, heavy soil more exposed to the action of the atmospheric agents. Although ashes render the soil more susceptible of this latter action, they at the same time increase its tenacity, and on this account are more especially adapted to light soils.

In humid soils the quantity used must increase in proportion to the moisture, but if waters stagnate upon them the ashes will not produce any effect, unless the lands are drained; and even then the effect in rainy years will be very slight.

Ashes, as we have said, are employed in all seasons, winter excepted; in the spring at first upon meadows and pasture lands; then for the sowing of barley, oats, and maize; in summer rape and buck wheats are manured with them; and in autumn, they are used in the culture of wheats and rye.

It is the custom either to mix them with the soil by a slight tillage, or to strew them over the growing crops; cast in this manner in the spring, over barley and wheat they visibly improve them; this practice, however, is but rare: I have tried both these plans, and have found that the former is decidedly to be preferred.

Experience also prefers lixiviated ashes to cinders. Theory does not support this view; but in agriculture, more even than in other sciences, we find "experientia rerum magistra." I have convinced myself of the fact here stated by experiments, but we nevertheless are not obliged to conclude that the results will be uniform in every case. Upon those soils fertilized by saline bodies, I am of opinion that cinders will produce more effect; but for those where phosphate of lime will suffice, lye-ashes having lost their soluble parts, contain more of this substance in the same bulk, and consequently will produce a greater crop.

**COST AND PRODUCE OF ASHES.**—The use of lixiviated ashes produces a double quantity of wheat, and one half as much more of other grain; here we have a surplus of wheat amounting to 4 hectolitres per hectare.

Say, that the sale of this wheat of the first crop produces 70f to 80f; and that of the other grain in the second, yields a medium of 50f to 60f; the expenses of this manure, (carriage &c. included), in the usual quantity of 30 hectolitres, at the price of 3f per hectolitre, will be 90f; thus yielding a profit of 40f per hectare, exclusive of the straw; as also of the dung which has been saved during these two years, and will be worth at least double the sum: Ashes then, even reckoning them at a high price, are evidently a loan to the land at a most usurious interest, clearly doubling itself in two years.

**ANNUAL CONSUMPTION OF ASHES ON LAND.**—We have seen that the effect of lye-ashes on the soil lasts two years; taking 20 hectolitres as the medium quantity employed, we shall have 10 hectolitres to each hectare per annum; after the two years without doubt much remains in the land, as it is found to be most profitable to use them but once in four years; but supposing all consumed in two years, we shall have as above 10 hectolitres per hectare, but these 10 hectolitres contain at least 4 hectolitres of phosphate of lime, and 3 of carbonate of the same: the earth then on which ashes have been used will have consumed a trifle more of lime than either marled or limed earth; but it will also have imbibed one sixth more phosphoric acid, one half of which only will be found in the produce; consequently, the rest remains in the soil, or forms other combinations.

Ashes are in a great measure lost to French agriculture; three-fourths perhaps are either entirely lost or badly employed; thus the loss is tremendous. Paris, which sends so far by water its mud to fertilize so large an extent of country, could afford a much better manure in the ashes of its washerwomen, one-tenth of the bulk of these acting upon as much land, and producing greater crops both upon the banks of the Seine and those of its tributaries, the demand for them would consequently be immense.

The quantity of ashes fit for this purpose in France, is very considerable; as out of eight million fires made by the French population, at least seven million are exclusively fed by wood; now we have seen that three-fourths of the ashes thus made are wasted; and these would suffice to bring prosperity, and even redundancy, to an immense extent of at present inferior land; they would increase the

produce of many hundreds of thousands of hectares by half, and which would be more too, than we derive from our six million hectares of woods, which would thus become the fertilizers of at least one-tenth of their extent of agricultural land.

**USE OF GROUND BONES.**—The analogy in the composition of pulverized as well as burnt bones, places them immediately after wood ashes; in both the one and the other, the greater part is composed of phosphate of lime, and that also is the active principle of each.

Our case we have made out for the ashes, we have only to reason from analogy to do the same for that of the bones.

And first, bones like ashes consist only with certain soils. M. M. De Dombasle in Flanders, and De Wrede in Germany, as well as many agriculturists in England and elsewhere, have found them of no value on their lands; but in the case of M. De Dombasle, it was only in places where lime was also ineffective, i. e. on calcareous soils. Some experiments, recounted by Masclet, make it appear that upon silicious soils, bones have the advantage over every other manure, while in those of a calcareous character, the case is exactly the reverse. It appears that in some cases they have been successful where calcareous formations constituted the substrata; but even in these cases it seems, that one-half the time there was nothing of that kind in the cultivated part of the soil. Further, it is certain that they have remained totally inert on chalky or marly soils, while they have been very active on dry soils not containing calcareous principles; it is then to such a principle contained in them that their efficacy is to be ascribed, i. e. to the phosphate of lime, which composes more than half of their substance invariably.

Their action does not depend upon their animal oil; for bones deprived of that, frequently produce as good effect as those from which it has not been extracted; it is not upon the gelatine contained in them, for if it were, their effects would be alike on all soils, which we find not to be the case; besides, it is recorded on the evidence of several experiments by Masclet, that boiled bones, which have lost nearly the whole of that principle in the process, are better than those in which the whole of it remains. Finally, English commerce has explored the fields of battle in Spain, in Germany, and at Waterloo, and has found that the bones, which were there exposed and had lost all their animal principles, have nevertheless produced as good effects as those still containing them. The active principle then cannot be gelatine, it can be nothing but the phosphate of lime; and indeed, practical men prefer those bones in which that substance is found in the greatest quantity, viz. those of the horse and sheep.

We may imagine then why the effects of pulverized bones are analogous to those of ashes; like the latter we find bones inert upon wet soils unless well drained; their action in small quantities is analogous to that of ashes; like them they do not exhaust the land; their effect also does not seem lasting, unless they are used in heavy dressings; finally, they must be used dry and upon a dry ground; this complete identity in property would alone prove, had we not already established it, the identity of the active principle in ashes and bones.

The general use of bones in agriculture does not appear to have originated more than thirty years ago; and is attributed to the discovery by a workman in the lead manufactory at Solingen, who first assayed it in 1802. This is however true only as it

regards Germany, in France from time immemorial the husbandmen of the neighbourhood of Thiers (Puy de Dome), used the waste from their cutlery; and in England, Colonel St Leger tried them in 1775; and further, Kirwan in his paper on manures, for which he was rewarded by the Academy of Dublin, at the commencement of the century, speaks of the use of bruised bones as a compost in the vicinity of large towns. Here then we see that each party has made the discovery, but the real merit is to profit by it, and that we cannot claim for our nation.

The progress of this improvement, formerly so tardy, has for some few years advanced with rapid strides; the English merchants seek bones in all parts of the world, even in India. Denmark alone supplies them to the extent of 1,000,000lbs per year. Join to those thus imported, the immense number obtained from the internal consumption, and it may be conceived to what an extent they are employed; thus, in more than one county, the inhabitants consider the introduction of the use of bones as manure, to be the greatest discovery of modern agriculture.

In France, however, they are as yet but sparingly employed, merely in the environs of Strasbourg and Thiers, where mills have been erected, and from whence they export them to some distance.

The Germans estimate a quintal of bone powder as equal to four loads of dung, and 15 to 20 quintals or 10 hectolitres per hectare, is their ordinary quantity, which lasts for three or four years. The Palatinate, Wirtemberg and Baden use it; and probably it is from thence it was introduced into Alsace. They employ the powdered bones in a similar manner to other manures, either spread on the surface or ploughed in; they mix it freely with both their winter and spring seeds, and sow it at the same time. The bones which they plough in are ground less fine than those which remain on the surface; the effect of the first method is the more durable.

The English do not entertain so high an estimate of the value of bones in proportion to that of other manures. In this case as in that of lime, their doses are much larger than those of other countries; although the price of bones is greater there than elsewhere, their medium quantity of 20 hectolitres or 40 quintals per hectare, is double that of the Germans; and sometimes this dressing is increased to double and triple the quantity on meadows and down lands; but then, as in large doses of ashes, the effect is prolonged beyond twenty-five years; and even after that period if the land be tilled it will be found well manured.

The price of bones in England has risen to 15*s* per hectolitre, and at this price their employ still leaves a profit, or their use would doubtless be discontinued.

It is especially on turnips that they seem to have effect; in some counties increasing the produce from three to tenfold. It is very remarkable that turnips thus treated are exempt from the attack of the insects which so often destroy them. They employ them most freely with the drill, sowing in the same line and at the same time, the compost and the seed; without doubt it is this method which preserves the young crop; the worm will not touch it, as it is growing in the midst of substances so obnoxious.

It is with bones as with other calcareous agents, their power is increased by the addition of other manures. Thus the admixture of bones with ashes mutually increases their effects; a certain Swiss found benefit from adding three pounds of sea salt to

each quintal of bone dust; and an Alsacian praises the addition of saltpetre. Further, when fresh bones are employed it is found advantageous to suffer them to ferment, and lose some part of their volatile principles; however, of all the preparations of bones the mixture of them with dung seem to have been the most successful; and the reciprocal action of these substances seems to double their effect. In all these cases time should be allowed for the reaction of the different principles contained in the bodies mixed, before the employment of the compost.

In the countries where the use of bones is great there are peculiar mills; we cannot dwell here upon that subject; but merely advise where the usage is novel to be content with mill stones, and iron wire sieves for separating the dust from the lumps.

The consumption of bones on the soil at the average quantity of 15 hectolitres per hectare in four years, will be rather less than 4 hectolitres per hectare per annum; a smaller quantity than that of phosphate of lime in the usual dressing of ashes, and leaving less lime in the land than the common lime manure.

This enables us to assess the cost of bones for our agriculture; at the English price this kind of compost would cost us 60*s* per hectolitre per annum; but the price in France may for many years yet be much lower, as, excepting in the neighbourhood of Paris, bones are almost valueless and useless.

This improvement then has scarcely commenced in France; at Paris, after what they use in the manufacture of bone black, and sal-amoniac, there are still two-thirds lost. In some other parts also they make bone black, but all besides is useless; however, the waste is immense. Two hundred thousand horses, and a quantity nearly equal to that, of oxen and sheep not consumed, which die every year, together with the bones of those animals which supply the average quantity of two ounces of meat to each individual per diem, will produce 2,400,000 hectolitres of powder per annum, which at the English price would yield 36,000,000*s* annually; this quantity of bone dust would manure 600,000 hectares every year, of which the surplus product would enrich both the public and individuals, and the ordinary composts would be used to increase the products of other land.

Thus we see a slight alteration in conduct with respect to an apparently unimportant article, if followed out in an extensive country like France, may become an important element of public prosperity.

USE OF BONE BLACK.—What we have said respecting the use of ground bones, may abridge our comments on this article; we have merely to prove that the active principle of both is the same, viz., phosphate of lime; and nearly all that has been said respecting the former will apply to the latter.

We have seen the power of phosphate of lime on vegetation in the preceding manures; here where it is purer it should be more active, and so in effect it is; for the dressing of bone black is much less than that of mere bone powder; otherwise the circumstances, attending its use and its action on the soil, are the same as those of the two last articles. It does not suit the calcareous soil, but does extremely well for a well drained land devoid of any such principle; its effect is not lasting, it acts in small quantities, it should not be employed on a moorish soil, it should be used on one rather moist than dry by nature; and farther it is composed of nearly nine-tenths of phosphate of lime; and the remainder consists of soluble substances, viz., sugar, molasses, a little albumen from the bullock's blood, and particles of carbon resulting from the combustion of the gelatine; but the fertili-

zing power does not reside either in the soluble and saccharine parts, or in the albumen; for before its use, by exposure to the air and weather it loses the greater part of these, but does not lose one tittle of its power; for it is known that large quantities of it, which had been exposed during many years in the yard of a sugar-refinery at St. Petersburg, and consequently had lost by decomposition all the animal and soluble particles, fertilized as potentially the fields of La Vendée as that from the refineries of Nantes.

Neither is it to be believed that the carbon produces, of itself, much effect, or we should find its action extend to calcareous soils, which is not the case; phosphate of lime then is in this substance, as it is in ashes and powdered bones, the most active agent.

French agriculture, which is so much to blame for wasting so much bone as she does, in some measure compensates for her fault by employing the bone black made in France, and also that of other countries.

The departments of Maine et Loire, La Loire Inferieure, La Vendée, La Vienne and Les Deux Sevres manure part of their soil with this substance; in 1828 175 vessels imported it to Nantes, which with Paimboeuf serves as the entrepôt for it from other countries; its price has risen from 1f to 7f per hectolitre, which is not yet half that of the bone dust in England and this increasing will cause the importation of still larger quantities.

Another analogy to the powdered is to be found in the action of the burnt bone on buckwheat, hemp, flax, cabbages, radishes and beetroots; also on the meadows and grazing grounds and the benefits it produces to the winter and spring corn.

The quantity employed is from three to ten hectolitres. With the first of these dressings its effect cannot be expected to survive the second year; with the second it will of course last longer.

Husbandmen have found its power too quickly exhausted, and complain that it does not produce its effects with certainty; on the other hand, dishonourable dealers have adulterated it; these occurrences have disgusted some: still the sale of it increases every year, and we have reason to believe that its price will also; unfortunately the quantity is small, and the Paris sugar-refiners have discovered a process by which it may be made to serve their purpose several times.

This scarcity and the high price may produce most happy results, since it may lead to the use of bones in their natural state to that of carbonized bones as at present.

This time, so advantageous to our agriculture, will be much hastened, if the opinions we have, as we think, demonstrated be generally admitted, viz., those of the identity of the composition of ashes, ground and burnt bones, and of the power of the phosphate of lime on vegetation.

**PEAT AND COAL ASHES.**—These are regarded in Flanders, in the department du Nord and in Belgium as among the greatest vegetative agents. Among the peat ashes, those of Holland or of the sea, bear a distinguished place: they are in much higher esteem than those of common peat; the quantity required being, as one of the former to five of the latter, to produce the same effect. They are formed by the combustion of the peat of Holland; this which has been formed under the sea, or at least has remained there for a long time, burns better, and above all, yields white ashes of a superior quality; doubtless these contain a greater portion of saline and of calcareous matter.

These last, as well as the peat and coal ashes, are employed on artificial grasses, hemp, spring crops and on the meadows which are not watered; they are become indispensable in the arrondissement of Lisle, where lime is seldom used as manure; in the others, especially in Avesne, they are often mixed with lime, in the proportion of one-half or one-fourth of the whole compost.

Dressings of ashes and lime, are more particularly employed on meadows and spring corn, in the same quantity as if they were of pure lime, i. e. 4 cubic metres or 40 hectolitres per hectare, every ten or twelve years.

The ashes of the sea act freely on clovers; they use from five to ten hectolitres of them to the hectare, and the clover yields a superb crop infallibly; the corn which succeeds it partakes of its fecundity.

The high price which the Flemings were obliged to give for these ashes, induced them to seek, and they have found a cheaper manure; they obtain from Picardy, and from their own earth, a mineral product to which is given the name of black or red ash, which supplies the place of the sea-ashes, too dearly sold by their Dutch neighbours. We will treat of this hereafter.

(Continuation in our next.)

## THOUGHTS ON DRAINING AS THE SPEEDIEST MEANS OF FERTILIZING THE SOIL.

(From the Quarterly Journal of Agriculture.)

It appears, then, from the observations which we made on the extension of draining in the last number, that much of the arable land, and the greater proportion of the natural pasture, in Scotland, require extensive and thorough draining. Could this truth be successfully pressed to conviction on the minds of proprietors and farmers, we have no doubt that thorough draining would be generally applied as a remedy without delay; for the experience which discovers the increase of produce by draining, becomes at the same time satisfied of its profitableness. That this conviction is really spreading apace, may be inferred from the great extension of draining which has been effected within these few years, particularly the last ten. What have been the immediate causes which have led to this improved practice, it is not our present purpose to inquire—that will form a subject for future investigation—our present purpose only being to state the fact as it exists. Whatever these causes may have been, this is their cheering result, that, amidst unprecedented difficulties, our agriculturists, by their own elastic energies, still continue their efforts to fertilize the soil. This result, undeniable as it is cheering, strongly urges us to prosecute the important subject which occupied our "thoughts" in the last number, which, we have the satisfaction of learning from various quarters, has excited no inconsiderable degree of attention, that our practical friends may still farther be induced to pursue the means which have produced so favourable a result.

It is the practice of physicians, that whenever a disease is known, a remedy is immediately applied to effect its cure. It is desirable that a similar rule of practice were adopted by farmers, as well in regard to the soil as to live-stock. It is desirable that where the disease of a wet subsoil is observed, draining should be immediately applied to effect a cure; and as a disease is only known by its symptoms,

that farmers would endeavour to acquire the symptoms of a wet subsoil, in order to be qualified to apply the infallible remedy of draining. As a practitioner, the farmer has greatly the advantage of the physician, for draining is a *specific* against all the injurious effects of a wet subsoil; whereas the most skillful application of medicine by the physician may be unavailing towards the cure of the disease. There being, therefore, the assurance of success attendant on draining, it is remarkable, that during the progressive improvement of agriculture in Scotland, one farm should now be left to be drained. Draining is no doubt a laborious, and expensive, and slow operation, but as, when properly executed, it invariably insures its own reward, it is remarkable, we repeat, that a single farm, instead of whole parishes, should now require it. Want of capital may deter some from undertaking it; but is the condition of the farmer so reduced, that credit cannot be obtained for him to prosecute even a safe and permanent undertaking, or his landlord so lost to a sense of his duty, as to refuse his support to a measure which cannot fail to promote his interest in common with that of his tenants? We cannot believe it. We rather believe when the will prompts, a way will soon be discovered by the perceptive faculty. We fear that apathy enervates the hand of one, and ignorance lulls the mind in conceit of another class of farmers. The allegation, though severe, appeals for its justification to the actual condition of small farms, which employ from one horse to two pairs of horses. Such farms are generally very low in the scale of condition, the ploughing is being seldom thoroughly executed; the horses being stinted of corn are kept in poor condition, and the ploughman, if he is not the farmer himself or his son, is a man who is hired, not because he is a first-rate holder of the plough and guide of horses, but because he has accepted the lowest rate of wages in the market. Having been hired on the lowest terms, he thinks his lowest rate of service a sufficient equivalent for them, and his time mispent in grooming a pair of horses which he considers only fit for the tan-yard; and yet he would any night cheerfully spend much more time than would be required to groom his horses properly, in the smithy, the news-room of "country politicians," or in the bothie of a neighbouring farm. The fences, if any on such farms, are generally neglected, and only repaired when necessity compels; and a short stump of a drain is at length made in a part of a field, only after it has been long seen that water stands on it in a pool, the horses sink in it, or it will yield no produce. The roads and spaces about the houses and steadings are always rough and dirty, and devoid of comfort to man and beast. The occupants of such farms have been stewards, or fornan-ploughmen, on large farms, who have saved a little money. They are not deficient in skill of farming; on the contrary, it is their skill in their former trusts which entitled them to ask and obtain such wages as enabled them to save money to take farms; but unfortunately for the continued exhibition of their skill, anxiety to become their own masters, and be the masters of others, before old age overtakes them, induces them to engage in farming before they have accumulated a sufficient capital to furnish their houses in the style of farmers, and to stock and carry on until the first crop is reaped, much less to improve their farms. The sons of such occupants seldom follow their fathers' profession. Witnessing a continual struggle for existence, they are glad to escape a thralldom which they have long experienced. Of a truth, there is no class of the agricultural population more to be pitied in their existent condition than this.

The large farmer can obtain credit, and can live above want, upon the small profit derived from large quantities of produce passing through his hands; the labourer receives his weekly wages, or his earnings by piece-work, which, if he keep his health, is an adequate income, to secure him and his family the necessaries at least, if not the luxuries of life; and the ploughman is insured his yearly income, who, after finishing his day's work, in a decent manner, can retire to his happy dwelling, relieved from care at least, if not from toil; but the class of small farmers of which we are speaking, have none of these resources to support them. All the produce which can be spared to take to market is but little, certainly not more than is requisite to settle the demands of rent and expenses, and not sufficient in quantity to leave a profit. Raised by penurious management, the produce of their farms is much less than it might be, and the quality of that produce is inferior. Lowly supported as they and their families are, and slovenly as the land is worked, the requisite live-stock which is kept on them bears a large proportion to the extent and produce of their farms. Theirs is a life of continual care and anxiety.

Another class of small farmers is widely different in condition from the one described. Having occupied land as life-renters, or on leases of long duration, at small rents, they have generally accumulated fortunes, which are always selfishly expended on stocking large farms for their sons, or lent out at interest to landed proprietors. As many of the sons of this class become farmers as the father has means to stock farms. In character this is a respectable class of farmers, and they form the connecting link between the large farmer and the ploughman. But having been bred up in the old school of farming, or succeeding to old-fashioned sires, their ideas become as contracted by constant residence, as their small farms; and the excessive prudence of this class forms as great a bane to the agricultural improvement of the country as the one formerly described. They will not spend a shilling until they can "clearly see their way" of regaining it with advantage. They will remain as they are, rather than "fly to ills they know not of." As to mending farm-roads, running fences, enlarging steadings, or draining fields, except to obliterate a pool of water, these are outlays of money which they conceive can never be recovered, and which ought only to be incurred by landlords, although in most cases they are richer than their landlords; and, in all cases, comparatively, can command more ready money than any landlord. Their horses and cows are in better condition, because this class of farmers are not so fond of overstocking as the other. The domestic comforts of the farm-house, though frugal, are also unexceptionable.

It is impossible to state what extent of land the small farmers in Scotland actually occupy; but what with them and the large farmers who neglect draining, the greater area is certainly occupied with the non-improving class of farmers. But, comparatively, there are fewer small farmers in Scotland than in England or Ireland. Is it fair to conclude, then, that the agricultural improvement of Scotland is greater, comparatively, than that of England or Ireland, just because there are more large farmers in it, since it is only by the large and most arable farmers that improvements have been prosecuted in that country? It is not evident at first sight what inducement prompts a large farmer to improve his farm which a small has not. Both apparently have scope for improvement according to their means. But a large farm does possess advantages for im-

provement which a small one cannot have. The *material* for labour is comparatively smaller, and is more fully employed all the year round, on a large farm; because a large farm is most likely composed of different kinds of soils, the labouring of which is so accommodated to the different states of the weather, as to economise, and not lose time. Besides, a very small profit on each portion of the large quantity of produce of grain and live-stock sent to market from a large farm, will generally leave a surplus over the expenditure of rent and expenses; and economy in labour, at the same time, reducing the expenditure, that surplus is increased, and, in such cases, is almost always disbursed in improvements, such as draining, liming, &c. Such advantages can never be derived from a small farm; but they are the chief resources which supply the means of improvement, without which farming could not repay its own cost. In short, a large farm is always a cheaper bargain than a small.

Now we wish to avoid the imputation of promulgating the heterodox doctrine, that small farms cannot be improved; on the contrary, we know they may be effectually improved. We know many instances of their improvement in Scotland, and the fact is in proof at this moment in Ireland through Mr. Blacker's exertions. But after what we have stated of the mode of working them, we maintain they cannot be improved but at comparatively greater cost than large farms. The possessors of large farms will thereby always have the advantage over small farmers in the markets, because their disposable produce being larger, at a smaller cost, their profits will be greater at the same prices. Nevertheless, let the small farmers improve the stamina of the soil by draining, and they will in due time discover that the *material* of labour which they now employ, notwithstanding that it will always be proportionably great on small farms, will then insure a larger return of produce. Increased produce will insure a profit, and a profit, however small, will form a disposable fund for further improvements, will thus give a command of ready money, and obviate most, if not all the evils, at present arising from small farms.

It is clear, then, from our first paper, that draining might be much extended in Scotland, and it appears from what has been stated in this, that one great bar to its extension is the negligent farming on small farms. It now remains to be shown, that the most speedy means which can be adopted for *fertilizing* the soil, is the extension of thorough draining. We say *thorough* draining, meaning thereby the thorough drying of the soil, whatever may be the mode adopted for accomplishing that object. That being the object which it is wished to be acquired, the means used for its acquisition should be adapted to circumstances. There appear to be only two methods of thoroughly drying the soil. One is what is called Elkington's method, which searches after, and detects the seats of large quantities of water which are naturally pent up among deep, impervious, and hidden strata. The water, in finding its way to the day, greatly injures the soil. Unless these springs are removed at their sources, it will otherwise be impossible to render the soil dry. This method of eradictory draining has long been practised, and its beneficial effects may be observed in every *arable* district where no large springs are now seen to injure the soil, although very much good as yet to be effected by this method of drying the soil in every *pastoral* district. This method has also been very successfully applied to the draining of bogs; indeed, it is the principal means of drying them. But by far the greatest injury accrues to the soil—the great arena

of agriculture—from the stagnation of water on its surface, poured from the atmosphere in rain, snow, hail, and dew, or derived from rivers, in inundations and percolations through pervious strata. The attempt to remove this leprous evil may be said to be only begun in Scotland. It is strange that the remedy should have been so long of being suggested! So long as the more obvious and apparent evils of springs attracted the attention of the husbandman, the subterraneous plottings of stagnant water passed unobserved. Now its baneful effects are deprecated on all hands, and draining is universally acknowledged to be the only remedy which can remove them. Not that the acknowledged remedy has yet been universally applied; but a serious acknowledgment of an evil will in time find an adequate remedy for its removal. But the Elkington method of draining is not the most advisable remedy for the removal of stagnant water. Such a remedy, like the opening of a large blood-vessel, might more quickly draw off an arterial hemorrhage than any other, but it would not remove a local inflammation. The topical application of leeches is better suited to heal an irritated surface. So another kind of draining which has been of late years adopted in this country, is better suited than Elkington's to effectually remove stagnant water from the soil. This kind has not yet received an appropriate designation. It has been called wedge, tile, frequent and furrow draining, none of which conveys the idea of its entire mode of action. Wedge-draining is so termed, because the drain is made so narrow at the bottom that a portion of the substance used to fill it is wedged down to form a conduit under it for the current of water to pass through. But this draining is only strictly applicable to strong clay soils. Tile-draining can only be properly called so when tiles are used, which should never be where stones can be obtained in sufficient abundance. Frequent draining is so termed, because it presents so many drains as to afford *frequent* opportunities for stagnant water to escape; but as wedge and tile draining may both afford equal facilities, and the actual frequency of the drains depending entirely on the nature of the subsoil, the term seems not very appropriate. Furrow-draining is so called, only because it is formed in the furrows; but the furrows may not always occupy the best position for thoroughly drying the land. We apprehend that *thorough* draining is not only the best descriptive term for that drain which removes stagnant water, but it also affirms what the drain really effects—the thorough drying of the soil. An appropriate designation for any term of rural improvement is a matter of importance, for country people are apt to prejudice of the nature and utility of any improvement before they have seen it, from the idea which its designation suggests. For example, let *tile*-draining be recommended to a farmer who had never seen tiles used for that purpose, and he will immediately ask, from the obvious sense of the term, if tiles are better than stones for draining. Or let *furrow*-draining be recommended to him, and he will tell you that his land is not wet enough to require a drain in every furrow. On the other hand, let *thorough* draining be recommended to him, and he would understand it at once, and his conception of it would be correct, that his land would be thoroughly drained by it.

Now let us inquire what thorough draining is, and how it operates. It may be best described by what it is not. It is *not* tile draining, for no tiles may be used in its structure. It is *not* furrow-draining, for it may be improper to run a drain in any furrow. It is *not* wedge-draining, for the drains may not be best

cut in the wedge-shape, nor may any wedge be used in them. It is not frequent draining, for some kinds of subsoils can be dried by placing the drains at a considerable distance from each other. And it is not the Elkington method, for it may not require deep drains; and it is not of a ramified pattern, because it is not intended to cut off the sources of springs. Thorough draining may therefore be defined as *that kind which removes surface water from subsoils, by placing shallow, though substantially constructed drains in parallel lines, at such distances and in such a position, as thoroughly to dry the soil without injury to their structure.* According to the spirit of this definition, thorough draining admits of drains being filled with tiles, stones, or other appropriate materials, provided they are substantially constructed; it admits forms of drains of any shape, whether wedge-shaped or otherwise, provided they are placed in parallel lines and not cut too deep; it admits the placing of drains in any position, whether up and down the slope, or along its face in a diagonal direction, provided the inclination given prevents the destruction of their structure by the force of running water; and it admits the running of drains in any place, and at any distance from each other, provided they be so near to one another that the water can have easy access to them from every direction. Thorough draining acts as an absorbent like a sponge, presenting in all directions numerous channels to imbibe the superabundant moisture. No sooner does rain or melted snow percolate through the ploughed soil, than thorough draining offers a safe conductor to receive and convey it away.

But another indispensable inquiry remains to be instituted before we can clearly arrive at the final conclusion, that draining is the speediest means of fertilizing the soil. We have to ascertain that state of the soil in which draining shows its greatest efficacy as a fertilizer of soil. Most people accustomed to field labour imagine that they can easily indicate the state of the soil which requires draining, and the exact places in which drains should be formed. Many egregious mistakes have thus been committed in draining, and particularly in thorough draining. Any one is competent to observe where a spring bursts out to the day, and where the soil is partially dark coloured when ploughed, and where it is in a pulpy state at the wettest place; and any one can detect the well-eye bursting out its waters near the bottom of a bank of natural pasture, surrounded with a verdant margin, and originating a train of those plants which luxuriate most vigorously in spring water, such as the florin, some species of poa, and the water-cress; but a palpable error would be committed, were any one ignorant of their nature, to attempt to cut off the sources of such springs. To accomplish that effectually requires a previous knowledge of the nature of the alluvial and harder rocks, among which springs generally originate, and especially a competent knowledge of those in the particular locality. Although springs clearly indicate an obvious necessity for draining, which, if effectually executed, will always recompense the cost, stagnant water under arable soil is not so easily detected. The evidence of its existence is not so much pathognomonic as symptomatic, to use still the phraseology of medicine. The crops commonly grown are most correctly symptomatic of stagnant water. Through its baneful influence the straw of white crops is short, small, fine, soft, easily broken from shortness, not brittleness of fibre, and stained as if with rain. The grain is small, and although at times well enough filled, has always a puny and palish appearance. Cutting grass is also small, fine, not long, and much inclined

to abundance of flowers, and of course to seed, which are both small. The hay is always light for its bulk. Pasture grass is short, stiff, not thick set nor fine, and of a bluish grass green colour. It does not fatten live-stock well, particularly in tallow. Sheep thrive worse than cattle on it, their wool being light, and to appearance dead. Little milk and butter are derived from it. Turnips are small, hard, and fibrous, and their leaves grow nearly erect, and are often margined with red. Potatoes are small in the stem and short, the tubers being small, watery when boiled, and the crop never very abundant. The symptoms from the land itself are, that it is apt to get foul with couch-grass, which, when hand-picked, cannot be gathered free from soil, but is easily broken, fine, and very adhesive to balls of earth. This weed renders the ploughing and harrowing of such land, particularly the harrowing, very tedious, and when both operations are repeated till the soil is free of it, the soil by that time becomes too much pulverised and deaf. The furrow slices of land rendered thus deaf cannot stand up on their own feet, but soon clap down, become obliterated, and assume a wasted and hungry appearance. The dead roots of stubble, when ploughed after harvest, do not adhere firmly to the soil, but are easily rubbed out by the coulter and mould-board, and carried forward in bundles before the coulter. The symptoms attendant on the application of extraneous matter to land in that state are, that farm-yard dung, whether fermented or fresh, does not quickly incorporate with the soil. It remains in an inert state, lumpy, and moulders away into a blackened mass. Bone-dust does not quickly incorporate with the land, therefore does not quickly decompose in it, nor does it ever impart that greasiness to the soil which is its valuable characteristic as a manure. Lime does not quickly mix with it, losing its caustic properties, and soon becoming like mortar, and of course *effete*. Hedges which are planted in it become stunted in growth, and covered with moss, and most of the kinds of forest trees are soon in the same plight. Plants indicative of dry soil never grow in it, but give place to those which thrive in moist earth, such as the horse-tail, dead-nettle, sprats, some species of the rush, thistle, &c. Besides these obvious symptoms, there are others more latent, which are only obvious after having been detected; such as the ground when felt in walking over or being trodden on. It is difficult to describe this sense of feeling by words. The ground feels less firm, more likely to slip under the foot by the arable portion sinking into or sliding upon the subsoil, and in some cases it will sound hollow on being jumped on. In such suspicious circumstances we have frequently seen drains release large quantities of stagnant water which had lain concealed and encased among beds of impervious clay. In short, when we come to examine thus minutely into the state of land, we will find a very small portion of it indeed that can naturally claim exemption from draining.

In considering this enumeration of evils, and the catalogue is a long one, it may be observed that most, if not all of them, are symptomatic of bad land, as well as that under the influence of stagnant surface water. The observation is quite correct. But it should be borne in mind that stagnant water turns good land into bad, and that bad land is so chiefly because it is permitted to remain injured by stagnant water. It is true that all sorts of land are not alike in their nature, nor alike in quality,—some are naturally good, and some naturally bad,—but in all the natural classes of soils which are easily affected by draining, and they are the most numerous, the good

of them are good, because they are naturally drained, being composed of, and resting on pervious materials; and the bad are bad, because they rest on retentive subsoils; and the more retentive subsoils are, the worse the soils which rest upon them. Soils, therefore, are not naturally so dissimilar in quality for the purposes of husbandry, as that they are rendered so by being naturally placed on dissimilar subsoils. Land, if of considerable depth, may, however, be very good although it rest on a retentive subsoil; but the good soil below the reach of the plough forms, in that case, the subsoil, and not the retentive matter, which may be at a considerable distance below it. The best natural soil would become bad if placed on a retentive subsoil. It is the nature of the subsoil, therefore, which stamps the quality on the soil for the purposes of agriculture, for the natural quality of soil is, in all events, much enhanced by the art of husbandry. Pure carse clays may seem to form an exception to these remarks, but attention to their nature, as they are really affected by stagnant water, will show that even they form no exception. Pure carse clay soils are generally formed in deep beds or in masses several feet in thickness, the pure clay itself forming the subsoil to the pure clay which is subjected to the plough. When water finds its way through arable soil, it descends to the subsoil, which, when impervious, it cannot penetrate, but slides down both sides of the ridges to the open furrows. But the arable part of clay soil can only be penetrated by water immediately after it has been ploughed; for soon after ploughing it consolidates, and the water then can only run along the *impervious surface* to the furrows; so that pure clay soils can never be said to stand over stagnant water: and should drains be placed in the furrows and open cuts formed in the hollows elsewhere on the surface, no surface water could long remain on them. Could a rounded form be given to the subsoil of the ridge upon which the sole of the plough moves, and that subsoil rendered smooth by the lower edge of the furrow slice, being cut clean with the near approximation of the points of the coulter and sock, the surface water that at any time might reach the subsoil, would pass easily off to the drains in the furrows.

Having contemplated the evils arising from water becoming stagnant under arable soil, let us now contemplate the reverse of the picture, the pleasing and valuable effects of draining. The existence of moisture being most easily known by its effects on the crops which are commonly grown on the fields, the benefits of draining are also first exhibited by them. The straw of white crops on thoroughly drained land shoots up strongly from a vigorous braid, is thick, long, and, at the same time, so stiff, that the crop is not easily lodged. The grain is plump, large, bright coloured, and thin skinned. The crop ripens uniformly, is bulky and prolific, is more quickly won for stacking after being cut, is more easily thrashed out, winnowed, and cleaned, and produces fewer small and light grains. The straw, also, makes better fodder for live-stock. Cutting clovers become strong, rank, long, juicy, and the flowers, though fewer, very large and bright of colour. The hay is heavy for its bulk. Pasture grass stools out in every direction, covering the earth with a thick mass of rank vegetation, which produces fat and milk of the finest quality. Turnips get large, plump as if fully grown, juicy, with the skin smooth and oily. Potatoes are long, and strong in the stem, with tubers large, with skins easily peeled off, and mealy when boiled. Stock of every kind thrive, become gentle tempered, and fatten easily, particularly sheep, which improve both in

mutton and wool. Land is less occupied with weeds, the luxuriance of the sown crops choking their growth. Summer fallow is then easily cleaned, when practised on strong soils, and much less work is required to put the land in proper trim for the manure and seed. All manures quickly incorporate with soil when drained. These all are symptoms of good land, observed on the same soil which formerly exhibited symptoms of bad; thus proving that by draining is derived the same results from bad land (that is, from the natural surface, whatever may be its component parts, when it rests on a subsoil naturally so retentive as to detain the surface water which reaches it until it stagnates), that are derived from good (that is, from the natural surface, whatever may be its component parts, when it rests on a subsoil naturally pervious to surface water). Can facts stronger than these be adduced to recommend the adoption of draining? Can statements stronger than these be produced on any subject to make out a clearer case in its favour, than have been now produced in favour of draining as a fertilizer of the soil? To hesitate, therefore, to drain land, is willingly to hesitate to confer benefits on one's self. None need urge the plea of inability from what of capital to undertake even the expensive operation of draining, since its effects are immediate as well as compensative. Every one can do a little to begin with: and every year thereafter, the draining, however small, will increase the means proportionately to extend similar operations in future. Besides, let a farmer think of the happiness which he is daily storing up for himself, in the contemplation of the enlargement of his means, from the judicious application of his skill and industry on that soil which is the source of his existence. At any rate, should the experiment fail, and disappoint his fondest hopes, it affords greater satisfaction to the mind, and confers a higher honour on the conduct to yield to the burdens incurred by improvements, than to sink under the obloquy of indolence, to encounter the charge of ignorance, or to suffer the imputation of revenge even against the real, and it may have only been, the supposed, unkindness of the landlord. If time permit by the lease, let him rather exercise a truer independence of mind, and show it by improving his land by draining, which will, in return, as surely as the effect follows the cause, improve his own circumstances, and place him in a condition of independence, above the request of a favour from his landlord. And should he have done all that industry and skill can perform, and still continue to struggle with pecuniary hardships, he then places himself on the high vantage-ground, from which he will be able with effect to demand the alleviation of his condition. Let him depend upon it, that that landlord must be an exception to his class, who would long withstand the just claims of unrewarded industry and skill.

But it is not to be understood, that draining is the only fertilizer of the soil. Ploughing, dung, bone-dust, lime, are all fertilizers of the soil; but without draining, as the precursor and the foundation, all "these appliances and means to boot," will encounter many difficulties, and raise but a flimsy superstructure. The action of all these "appliances" on the soil after it is drained, would form an interesting inquiry for another paper.

The best sites and positions for drains should now occupy our attention; but the subject is attended with so many practical difficulties, that it is impossible to explain them in writing. Many simple cases, it is true, both in spring and stagnant water-draining, may occur in every man's practice, in

which he may with ease judiciously apply the Elkington and thorough-draining systems; but in most cases neither of them is easily applied, particularly in the less obvious cases of thorough-draining. It is not sufficient to run a slim cut in every furrow, and fill it up with a few tiles, and hurry back the earth upon them. The furrows may not lie in the proper direction, and they may have too great a declination to drain the land thoroughly. It is *effectual* draining that is required, and not the mere cutting up of furrows. This constitutes an important distinction. When a farmer is not well acquainted with this distinction, and has a considerable quantity of land to drain, on which he wishes to pursue the thorough system, we would recommend him to employ a professional drainer to lay out the drains for him in the first instance. The amount of fees to the professional drainer will be but trifling, compared to the advantages for ever to be derived from his directions. The few pounds of outlay in this way will be lost among the many which they will surely and quickly return. Knowledge thus acquired from fixed principles, which have been deduced from experience, will enable the farmer himself to assume with confidence the character of drainer; but without the guidance of this knowledge he will miss his aim, and whilst he is thus injuring his land, he will be draining his pockets.

But although it is impossible to indicate in writing, the exact positions of drains on any class of soils, yet a few hints on those which admit of the greatest application of draining may not be unserviceable to the young farmer. Correctly speaking, pure homogeneous clays cannot be *drained*, draining literally signifying a percolation of water through a pervious medium. The only mode of keeping clay soils dry, is by the removal of surface-water, which may be completely effected by open cuts on the ground at the hollowest places, in conjunction with small drains in the furrows between the ridges. Hitherto open cuts only have been used on clay land, but now-a-days drains in the furrows are strongly recommended to co-operate with them, and the recommendation, when attended to, has been accompanied with as much success as the inordinate breadth of ridges will admit of. Ridges of clay soils are generally formed broad, and often crooked,—broad, because the land had to be many times gathered up from the furrows to keep it dry; and crooked, because they had been formed at a period when a long team of draught animals were attached to the plough, which, on reaching the ends of the ridges, required a long sweep to turn on. But furrow-draining clay land will no doubt have the effect of altering the shape and form of its ridges.

We are aware that the alteration of clay ridges is attended with considerable danger to the succeeding crops, and is therefore seldom attempted; but we believe that danger follows the alteration, only when the state of the land so altered has thereby been changed, for the worse in respect to the facility of being kept dry. It is in all cases desirable that ridges should be straight, and also so narrow as to afford as many outlets as practicable to surface water. Of the two methods of draining formerly enumerated, that of Elkington is inapplicable to pure clay, because the impermeability of clay to moisture prevents the collection of springs in it; and of the different kinds of thorough-draining, the furrow seems the only one suitable to it; because pure clay being generally a level alluvial deposit, the direction of the furrows in it follows the only line of declination of the ground, and therefore the only line suitable to draining. The furrow-drains

should be shaped according to the nature of the materials which the clay can supply for filling them with. Since pure clays supply no hard-stones, which are the most proper materials for filling drains with, other substitutes than stone, which, when inconvenient to be brought a long distance, must of course be provided. The substitutes are clay, rough sods, peat, sand or gravel, and tiles. Sand or gravel is very seldom found associated with pure clay, and therefore cannot be expected to be found in any quantity. Worked clay may be formed and used as wedges, the opening under which permits the flow of water. This is called "plug-draining," and requires a particular kind of apparatus for its construction, which has been described in vol iv. p. 501 of the Quarterly Journal of Agriculture. Rough sods when a little dried, form light, tough wedges for drains, when placed with the grassy side downmost. Peat is a formation which is frequently found in large quantities on pure clay. When dried and hard it is very impervious to moisture, and therefore forms excellent material for drains in clay land. And in no class of soils are tiles so applicable to draining as in pure clay; and in it they are accordingly used in large numbers. They are better than any of the materials commented on for forming the open conduit at the bottom of drains. But the method in which they are usually employed is objectionable. They are laid in the bottom of drains, on their sharp edges, and then heavy materials placed above them. Such a practice must have undoubtedly originated in an inconsiderate attention to the nature of clay, however tenacious it may be. The circumstance of the bottom of the drain feeling quite firm to the foot when formed, may have led to the belief that it would always remain so; but the fact is, that when water has run for a time on clay, a portion of its upper stratum becomes soft and pulpy. The sharp edges of the tiles soon cut through this clayey pulp, and the weight of the materials above them acting as a constant weight, sinks them still further, and squeezes the pulp at the same time up into the bosom of the arch, thereby at length either closing up the orifice altogether, or separating it into detached portions. To obviate this inconvenience, tiles have been formed with broad phlanges or shoulders to rest upon, and which no doubt will prevent sinking better than sharp edges; but the most obvious remedy for the evil is laying firmly in the clay as a pavement, soles of tile or slate for the tiles to stand upon independently. Should the soles be made to sink with the weight of material above them, which is unlikely, on account of their broad surface, the tiles will sink with them, and thus keep the conduit always open. Nor should tiles be perforated with holes, as they only serve to render them weaker, and especially as the lines of space between them and the soles on both sides are quite sufficient to convey away all the water that will find its way down the sides of the drain; the holes being thus unnecessary. Dried peats, dried sods, tan bark, gravel, sand, whichever is nearest at hand, form excellent filling above the tiles, and should they be at a great distance, course but hard bricks should be made and burnt on the spot. The breadth of the drains at top and bottom should of course be much narrower when these materials are used than with stones.

Pure sandy soils, though apparently of an opposite nature to pure clays, are not so easily drained as might be supposed. Indeed, it might reasonably be supposed, that they should require no draining at all. But they, like clay, are a level alluvial depo-

site, and when free of, and do not rest on gravel, retain water for a considerable time. The texture of large flats of sand is very fine-grained, constituting what is commonly called *deaf* sand, which, when a little water is thrown hastily upon it, consolidates, and then absorbs any more moisture very slowly. Very frequently this sand rests upon carse clay as a substratum, and then, when not of much depth, it constitutes *quicksand*. Furrow-draining will render these sandy soils completely dry, although a drain in every furrow may not be requisite. Whether stones or tiles are used for their construction, neither of them should be employed without soles, otherwise the fine particles of sand taken up from the bottom of the drain, and carried along by the water, and deposited in the eddies, will in time fill up the conduit. Besides, stones or tiles without soles, would inevitably sink out of sight in such a sandy bottom. When quicksands are met with, the drains should be regularly built through them, with the stones resting on flags, the spaces between the stones teathed up in the face with tough turf, and the conduit made large. The turf prevents the ingress of fine sand along with the water from the quicksand into the drain.

Gravelly, sandy, and loamy soils, resting on gravelly subsoils, are naturally so dry as to require no artificial draining, the gravelly soil acting the part of a universal superficial drain much more effectually than any of the systems of draining enumerated. Even a clay soil, if not too thick, resting on a gravelly subsoil, which is a rare arrangement of soils, requires no draining. A naturally porous subsoil is therefore better than any species of draining, inasmuch as it presents at all points channels for the conveyance of water, such as, for example, gravel, when a subsoil, generally appears in beds of great thickness, and is therefore capable, at every point where it is in contact with the soil, of conveying away any quantity of water that might fall from the atmosphere. Soils resting on gravel are generally prolific. A hazel loam of from eighteen inches to two feet in depth so situated, is perhaps the finest agricultural soil that can be desired. Every species of crop, white or green, can be grown upon it to perfection. Most of the green crops may be consumed upon it. Live-stock can always lie comfortably upon it, and it can be worked with advantage at all seasons, and, of course, worked economically. We have heard a farmer, who possesses a farm of such land, not a large one, for a large farm of such soil is perhaps not in existence, at least in Scotland, offer his ploughmen a roast fowl to their dinner on that day they got their feet wet at the plough.

Soils of moderate depth, when resting on rock, cannot be artificially drained. Stratified rocks, with a considerable inclination, and fissured rocks, form safe drains for soils; on the other hand, amorphous rocks of close texture, with little inclination, form the most impracticable subsoils of any material. Fissured and stratified rocks support soils of fine quality, whereas fine-grained impervious rocks render their soils almost sterile.

Instances of clay, sandy, and gravelly soils, resting on clay, sand, gravel, and rock, may be found in patches of considerable extent over the country; but when all combined, they form rather the exception than the rule to the general state of the soil in this country. The soils generally to be found consist of strong heavy clay, thin in depth, and not fine in texture; a thin clay, with a sharp gravel in it; a brown and black loam, deaf, and of very moderate depth below the plough; a thin, sharp gravelly loam, of a brown or black colour; and a thin peaty

and vegetable black mould, deaf, and loose. All these common soils rest on retentive subsoils, and possess very different characters. Subsoils display less diversity of character than soils. They consist chiefly of dark-coloured clay, coloured by the oxide of iron, more or less compact, and intermixed more or less with stones, from the size of small gravel to that of a man's hand; sometimes containing numerous boulders of various kinds of rocks, principally of the primitive class, and of various sizes; and almost always having thin horizontal contemporaneous veins of sand surcharged with water, interspersed through them. The surface-water finds in these veins of sand the only conduits to pass into the subsoils, where it remains impeding the progress downwards of the succeeding surface-water, until it finds a vent for itself into a drain, or is again evaporated by excessive heat into the atmosphere. The water which is prevented at all entering into the subsoil, by the repletion of the veins of sand, if not evaporated, remains accumulating with fresh supplies upon the surface of the subsoil, in the line of junction between it and the upper soil; which line, when exposed by the incision of a drain, never fails to present unequivocal proofs of the retentive nature of the subsoil, by emptying its copious contents of stagnant water into the drain, along the bottom of which it may be very perceptibly observed escaping like a tiny river. The draining of such subsoils constitutes the difficulty of the art, to overcome which difficulty is beyond the power of the pen. Experience and practice alone can determine whether it should be overcome with one method of draining or another. Were such draining effected, the whole of the presently undrained, but improvable soil of the country, would be rendered capable of receiving the benefits of numerous indirect modes of fertilizing it; the draining would be the first step towards improvement; but if neglected, and the soil permitted to remain as it is, every other means of fertilizing it will only prove comparatively abortive in their application.

---

[We solicit the attention of our readers to an extract from a little work entitled "Practical Farming," from the pen of Mr. Hillyard. We have upon more than one former occasion felt gratification in commending the exertions of Mr. Hillyard in the cause of agriculture. He has not however, put forth any publication to the world, which is so practically useful, and within the scope of the least educated of the agricultural community, as that to which we now allude. It is sold at the small sum of 2s 6d. Every farmer, and more especially every one who has a son likely to follow the same employment should possess himself of a copy of "Hillyard's Practical Farming."—Ed.]

Manure is the chief sinew for carrying on good farming. Sir Humphrey Davy, and other scientific persons, have said that the quality of manure is much injured by the common practice of throwing it up into dung-hills, and thus creating so strong a fermentation as to cause the gases, which are the nutritive parts of it, to escape. It may be so; still, I think farm-yard manure, in which there are sure to be the seeds of weeds, ought to undergo a fermentation to prevent their growth. Manure made from wheat straw by stall-feeding beasts, I do not object to being immediately put on the land; but not that made at the barn-door, in which there are sure to be quantities of the seeds of weeds. All refuse that has vegetable

matter in it may, with manure or lime, be turned into an excellent top-dressing for grass land. To lay on ploughed land, it should be burnt, but slowly, or very few ashes will be obtained. Ashes, incorporated with a strong soil, do much good; they create separation, and thus make it work better, and enable the fibrous roots to search more into the soil, to gain nourishment. Lime has the same effect, but I conceive lime to be a stimulant only, and not a manure. Lime gives solidity to light land, the means of retaining moisture, and in some degree prevents the rays of the sun from penetrating so deep into the soil, and drying up the roots. Lime also encourages the growth of clover, but it does not do the good that is equal to the expense, when applied to land that has, for a length of time, had it periodically laid on. It is the common practice in this county to lime and dung the land for turnips nearly at the same time, just before sowing. I think to put on materials that must cause such different effects cannot be quite right, and therefore I think it would be better not to put on the lime till the next Spring, before sowing barley and seeds. Manure is a mine of manure for those who are so fortunate as to have it as a subsoil, but the desire of possessing it is lessened because it generally lies under an inferior surface soil; this applies more decidedly to chalk. If land is free from twitch and other noxious weeds, there is no necessity for a great quantity of manure to produce a good crop of wheat. If twitch has got possession of the land, it will impoverish more than a crop of grain. In most arable fields, or closes, there are different kinds of soil; and thus some parts want more manure than others. In laying manure on, this ought to be attended to; in hollow parts of a field, there is sure to be crop enough, without manure, from the drainage from the higher parts. By not attending to this, I have seen some parts of a field with a very light crop, and other parts so heavy as to be rotting on the ground. The richness of a farm may be estimated by the quantity of good vegetable crops growing on it. The land which produces these has that within it which must afterwards produce good crops of corn. Manure ought to be ploughed in as soon as possible after having been carted on the land. I have seen it laid so long, and thus so exposed to the sun and air, as to convince me that the greater part of the nutritious qualities had evaporated, and that the next crop grown would prove it. Manure dropped by animals (sheep excepted), on pasture land, does very little good at any other time than winter; the effluvia arising from it attracts innumerable quantities of small beetles, that consume all the nutritive qualities in it. If sheep were confined in a littered fold every night, much valuable manure might be produced; but folding in that way is objectionable, since it is likely to produce a complaint the most troublesome and difficult to cure—foot-rot. If there should be a carriage-road in the pasture, sheep ought then to be folded, to prevent their leaving their manure on it. It is a common practice, in Norfolk, to make what they call a mixen. The manure is placed between two layers of mould, and is not turned over and exposed to the air more than a fortnight before it is required for use, so that when applied to the land it has undergone only a slight fermentation. Much greater quantities of good mould might be collected from the road-sides than is commonly taken. Book farmers recommend in some cases putting on fifty loads of compost manure per acre. It is much more easy to recommend than it is to achieve that which is recommended. Six hundred load for twelve acres, which is not a large field, is not easily got together. —*Hillyard's Practical Farming.*

## STATE OF AGRICULTURE.

FIRST REPORT FROM THE SELECT COMMITTEE APPOINTED TO INQUIRE INTO THE STATE OF AGRICULTURE.

Mr. JOHN HOUGHTON called in, and examined.

Marquis of CHANDOS.—Where do you reside?—At Sunning-hill, in the county of Berks, and Dinton, in the county of Buckingham.

What are you?—I farm extensively, and am a receiver of rents.

Do you receive rents for many gentlemen?—I do.

In different counties?—Yes.

Name them?—In the counties of Lincoln, Buckingham, Middlesex, Surrey, Berks, Sussex, Northampton, and Suffolk; and value lands also in other counties.

Where do you farm?—I farm myself, on my own account, at Sunning-hill, in the county of Berks, at Ruislip, in the county of Middlesex; at Flannington, in the county of Northampton; at East Hoathley, in the county of Sussex; and in Buckinghamshire likewise.

You have visited those properties in different counties from time to time?—I have bailiffs at each of them, and occasionally visit them all. I am also receiver for estates where each farm is situate. I have thought it proper to have a farm of my own there that I may introduce a system of husbandry from different counties, that others may see the different way in which land is managed.

How many years have you been employed in this way?—I commenced farming in the year 1822.

What is the state of the farms on those properties now, as compared with a few years ago?—Rents are much reduced, and particularly in the county of Buckingham. An instance I would prove, of a farm reduced from 1,300*l.* a year to 870*l.*

Within what period?—From the year 1814 to the present period.

What is the description of that land?—Principally grass, of the best description.

It is one of the best grass farms in the county of Buckingham?—Yes.

Has this farm changed tenants often?—It has changed in the same family.

What rendered the reduction of that farm so necessary?—From the lowness of farm produce.

Farm produce, connected with the grazing farms?—Yes, as applied to that district.

In what way is the produce of a grazing farm affected at the present time?—Grazing at the present time is much better than what it has been for a time past; meat is fetching a much better price than it did a short time ago, this year, as compared with last year and the year before.

What other causes have rendered it necessary to reduce the rent of this farm?—The increase of poor-rates in the parish in which it is situate.

Is there anything else?—The burdens that press upon the farmer was another thing which I should be very glad to see reduced.

At how many years' purchase was that farm sold?—At 29; rather over, but under 30 years' purchase.

That is one of the finest farms in the county?—It is.

Have you not arable farms in the county of Buckingham, over which you are steward?—Yes, I have.

What is their state now, compared with the state of the grazing farms to which you allude!—On the heavy clay lands the distress is very great, more than it is on the turnip and barley lands, or grass land.

How do you account for that distress upon the clay lands?—From the low price of wheat.

Has the wheat market been falling throughout the different districts of which you have the superintendance?—It has. Within the last few markets we have been enabled to get better prices, but now it is ruinously low.

Within the time you have had the management of those estates, have you seen great alteration on the part

of tenants for the worse?—In some instances very great indeed.

In which counties principally?—I do not know any county more than the county of Buckingham: in some parts of the county of Huntingdon I have seen great distress.

Do you find that the capital of the farmers has been diminishing?—Certainly, in those instances of which I speak I do not think the distress has been so great on the light land farms as it is on heavy; I think the great distress has been on the heavy land farms.

Have the farmers been paying their rents out of their produce, or out of their capital?—If you take the heavy clay land, certainly out of their capital.

Do you conceive in the heavy clay lands to which you allude the capital of the farmer is gone?—It is deteriorated very much.

Having a great knowledge of farming, has it ever entered into your mind what would tend to relieve the farmer from the distress he feels?—Certainly it has.

Have the goodness to state to the committee what your opinion is as to the mode of relief which could be brought to bear on the present distress?—The commutation of title would be a very great thing; another, to allow us the use of barley for our own use on our farms exclusively.

That is as to malt?—Yes, or to use it any way, either for cattle or for malt.

What besides?—I should also consider that we are entitled to a reduction of the county rates, and also a reduction in the assessed taxes; I apprehend the assessed taxes, in point of amount, are very small: from not knowing the laws, many illiterate farmers get into all sorts of scrapes by using a horse or carrier's cart. If a man has a close a little way off, he may mount his shepherd on a horse, or when he is going to market to get home some stock, the surveyor of taxes may get hold of that and surcharge him for the servant, and the horse too; and he perhaps, owing to his ignorance, lets the day of appeal go by.

On this arable farm, in the parish of Dinton, supposing the free use of barley was given to the tenant, what would be his benefit by the year?—It would make about 20*l.* a-year difference to him.

What is the size of that farm?—Near 400 acres.

He would have 20*l.* a-year in his pocket?—Yes, and that would also make a greater saving, taking it in another way, and he would be enabled to give to his labourers a greater quantity of beverage, which would reduce his expense in money.

Do you conceive the great importation of produce from Ireland in any degree detrimental to the farmer? I do not think we could interfere with that. I had last summer occasion to visit Ireland for a gentleman, and I took particular notice of that country. Generally I will state what I saw there, if it is wished. A well-regulated system of poor laws would be a great relief to that country, and to us, in my opinion.

You think that we should be benefited by a well-digested system of poor laws in Ireland?—Yes, under a proper plan.

Is your farm in Buckinghamshire tithe-free?—It is subject to a corn-rent; I have not suffered myself so much from tithe as some of the other tenants have in other places where I have been; two years ago I published a plan for commutation of tithe, which I shall be happy to give to any member of this committee.

Mr. CAYLEY.—At what period did this distress you speak of commence?—It has been from 1828 and 1829, up to the present time; we have been gradually getting worse.

In what condition were the farms in 1822, when you began farming?—Worse than at the present time, but it was only for a short period; prices were very low, and corn was very cheap indeed.

Do you remember its getting better about 1824 and 1825?—Yes, it was much better in 1824 and 1825.

When did it decline after that?—1826 was very a very dry summer, and we were distressed in 1827; we had it better in 1829 and 1830; we had some very wet seasons, and it was very bad indeed for the heavy clay lands.

Taking 10 or 12 years together when was it a very prosperous time for farmers?—If there has been benefit anywhere there has been none on heavy land.

Producing what?—Twenty bushels an acre.

Is there any land in your neighbourhood producing more?—Yes, certainly.

Is there any producing 30 bushels an acre?—Yes.

What is the condition of those that farm that land?—They are badly off; I could name a party in North Wiltshire, near Swindon, where they are dependent on the price of wheat, cultivating wheat largely; so too I was in that neighbourhood last year, and they were very much distressed there, owing to the low price of wheat; I am speaking of the great distress that has to my knowledge occurred where wheat is the staple commodity.

How much rent is paid in districts with which you are acquainted which would produce 30 bushels an acre, and what is the proportion of that to other lands?—But small, compared to Huntingdonshire, and take Caxton upon the heavy strong land; if I were to take an extent of clay lands together, very small.

What proportion does the land bearing 30 bushels an acre bear to the other species of land?—There is a large quantity that will bear 30 bushels an acre, but not the strong poor clay land, of which I am now particularly speaking.

You would not call land poor land that bore about 30 bushels an acre?—No, except where it might for once, if the season exactly suits it; but no practical man can form a calculation upon it as the ground for a series of years.

Speaking of the average, how much land is there in the district of which you are speaking that could on the average bear 30 bushels an acre?—A very small proportion indeed.

Even upon that species of land that bears 30 bushels an acre a farmer cannot make any profit?—I am certain he cannot at the present price.

You stated that the light lands are better off. Why are the light lands better off?—Because they have had an opportunity of growing stock, and wool has made a remunerating price; therefore they are not so much distressed in the Wolds of Lincolnshire, between Louth and Spilsby, as they are in some other districts.

Wool has born a higher price within the last five years?—It has.

To what do you attribute that?—To our manufactures being so prosperous.

Have you heard of any losses from a rot in sheep?—I have lost a good many myself.

Did a rise of price immediately follow that rot?—Not immediately, but afterwards.

Did it follow as soon as the extent of loss could be ascertained?—I think it did.

Would not you attribute the rise in the wool to the rot in sheep?—Yes, in part; but I also attribute it in part to there being such a good trade for the commodity.

Can you speak accurately to the state of our trade?—Yes, I am constantly travelling the country; I have an opportunity of conversing with large manufacturers and have an opportunity of seeing them, and I have visited some of our largest manufacturing towns; and I too have conversed with mechanics.

Since what time has that principally been existing?—More particularly the last year and a-half.

Did not the high price of wool precede that?—No; during the last ten years we had a very great depression in wool. I was a holder myself seven years, and at last sold for 20*s.* a-tod.

When were those seven years? I sold it in the year 1830; therefore it would be the six years preceding that.

The wet season commenced in 1828?—The period of 1828, 1829, and 1830.

It was in that period the high price of wool commenced?—We have had a much better price since that, five years ago.

And you conceived the prosperity of the manufactures to have commenced only two years ago?—When I say that the rise of the price of wool might be occa-

sioned, which I think it was, from the great rot in sheep, I think, unless the manufacturers have been prosperous, we could not have maintained the price as it is now, for I think the rot has been sufficiently got over, and we have got back to the same state the year before.

Though the effect of the rot has been got over, the deficiency caused by the rot has not been supplied, therefore the effect of the rot would still be felt on prices!—The effect of the rot would now be got over; and unless the manufacturers were in a very prosperous state, we could not keep up the price of wool to what it is now.

Can you speak particularly to the effect of the rot being got over?—Yes, by my own flock of sheep, and others also.

Are you a great buyer of wool?—Not at all.

If you are not in the habit of attending markets or sales to buy wool, how did you ascertain whether the quantity of fleeces are the same in the hands of the farmers as they used to be?—Many of our farmers lost their flocks in the rot years; now I see, in passing their farms, that their flocks have got up to what they were before.

Are you speaking of the Wolds of Lincolnshire?—No; there was no rot there on the cold heavy lands; I am speaking of Huntingdonshire, Northamptonshire, and Buckinghamshire.

It is your opinion that the loss sustained by the rot has been got over?—I think it has pretty nearly, but it has not been got over in particular instances, it has in others, because some farmers, from the great depression, have not been enabled from any means they possessed; I know many men who have been obliged to go to their friends and get security for money to enable them to buy sheep to stock their farms.

Was there not a panic extending to the low lands with respect to keeping sheep upon them, so that the farmers would not venture to keep flocks upon them subsequent to that period?—I certainly think that, generally speaking, persons who used to keep flocks keep them now; I think for a time they were timid, I was myself, but now I go on as usual.

In consequence of the high price of wool?—In consequence of stock bearing a more remunerating price than corn.

Does it come within the sphere of your information to ascertain whether such a rot ever took place in the memory of man before?—I recollect a very bad rot before.

To the same extent?—I have not an opportunity of knowing the extent; I recollect in 1825 travelling through Romney Marsh, and seeing a great devastation of the flocks at the time.

Was not 1825 a dry year?—No, 1826 was a dry year.

You state that you would recommend a commutation of tithe, the unrestricted use of barley, reduction in the county-rate, and reduction in the assessed taxes, and a well regulated poor law for Ireland, as means whereby the farmer might be relieved?—Yes, and no alteration in the currency, in my firm opinion.

Do you remember the farmer ever being in a prosperous state?—Oh yes, I recollect that very well.

Was his tithe commuted then?—No.

He was prosperous in spite of tithe?—Yes; but I have always had an opinion that it would be much better for the church and for the farmer to commute the tithe.

Do you recollect the time when a farmer had the unrestricted use of his barley?—No.

But the farmer was prosperous?—Yes.

Do you recollect when the malt-tax was much higher than it is now?—Yes.

Yet farmers were prosperous then?—Yes.

Do you recollect the time when the county-rate was lower than it is now?—No.

Yet the farmers were prosperous?—Yes.

Do you recollect the time when the assessed taxes were higher than they are now?—Yes.

Yet the farmers were prosperous?—Yes; I suppose it is wished that I should go to the time when we had

high prices and paper currency; I have stated my objection to the alteration of the currency.

If the farmers have been prosperous with all those burdens upon them and bearing upon them in a still greater ratio than they do now, in what way do you conceive they have tended to their present adversity?—There is no doubt that the coming from a paper currency to a gold standard would have the effect of lowering prices very much.

To what extent do you suppose?—To a considerable extent; there is no doubt of that; but now we have come to that, while we have had an unlimited use of paper, in my memory I very well recollect it had this effect, that a farmer would go to a landlord, and take land at a higher rate than he could possibly make it answer, because he had a facility for borrowing money of his banker, who was anxious to get his paper afloat; then we had a regular blow up; I knew many farmers who were doing comfortably under the old system, when men who had the issuing out of this paper money offered it to them, and they were induced to accept of it, little thinking how soon they might want the money to pay again; some were not prepared to repay it, and then there was a blow up; in my opinion it would have been much better not to have come to the change quite so quickly; but now things are finding their level under it; I think I would not go back to the old system, because it makes men go and take farms who do not understand the nature of farming, and get into all manner of speculations and theories; if we were to have a paper currency now, we should have a greater panic than we had in 1825; if I want money I can get it now.

You think it would have been better not to have returned to a gold currency?—Not quite so quickly.

Is it your opinion that it would not have been better to return to a gold currency, because it lowered prices so much?—I think we returned too quickly, that was my opinion at the time.

You think that the fall in prices is to be attributed to the alteration of the currency?—Yes, I think it would have been better to have taken a longer period.

You state it as one of the disadvantages of the paper system, that tenants were induced to offer a higher rent than they could pay?—Yes, I could name many bankers who went down with the panic in 1825 who lent money to the farmers; and farmers have been induced to take land on those gentlemen going to them for the purpose of lending them money; when the panic came, down went the prices, and not only the bankers themselves, but the farmers were also ruined.

You stated that a great many farmers were ruined in consequence of the paper system?—Yes, a great many in my opinion, I could name, were ruined, who had borrowed money of bankers at the time, and who took such a quantity of land; and it is an act of injustice to men of capital to have to compete in the market with a man who has taken a farm without any capital. I have not a fair chance with that man; he goes and gets paper, and comes into the market with as good a grace as those who have a fortune to stand on.

Can you state whether more have been ruined since or before 1825?—I think we have had great ruin since that time; but now we are getting over the effects of returning from a paper currency, and I think it would be better not to go back again.

You state that land growing 30 bushels of wheat per acre will not pay the expenses of cultivation; do you consider that getting over the return to cash payments?—No, but so far as that goes, it was right; but if you have a paper currency again, that will raise prices; but afterwards you will have a much more difficult thing to combat with than by giving us relief, by which we may do without that.

Can you state what led to the panic in 1825?—All sorts of speculations; I could name men who went without the least knowledge of a farm into farming; and one instance I can name of a man who went to look at a farm, and it was covered with snow; the farmer said he should have the money, and he took the farm without any thing more.

Did you not state that in the years 1823, 1824, and 1825 the farmers were prosperous?—Yes.

Not only the speculating farmers but other farmers?—Yes, but in 1826 we suffered very much from the panic; we had very low prices; I lost more money in 1826 than any other year I ever recollect.

Do you think the farmers did generally lose more money in 1826 than since?—While the high prices were going on they could not lose money, but it could not go on.

Do you think the farmers can go on much longer, as things now are?—Not without relief, but that can be given without paper currency; I can point out another plan—by allowing corn to be distilled for spirits, and the spirits to be exported; that would be a very great relief for this country, and not any injury whatever to the revenue.

Mr. SANDFORD.—Are you to be understood to say, that a farmer at the present moment, having a good security to offer, can without any difficulty obtain money?—To any amount.

## PARISH OF ESKDALEMUIR.

By the late Rev. Wm. Brown, D.D., Minister.

**LEASES.**—The common length of leases on sheep farms containing a portion of arable land, which is the description of farms in this parish, is nine years; but this is too short; for there is not sufficient time for making any great improvement, and these, if made, are scarcely finished, and the farmer has hardly begun to enjoy the fruits of them, when, by their being brought again into the market, they become a temptation to a new bidder. On the Duke of Buccleuch's farms this is indeed corrected; for there, there is no exposure to public roup, nor private offers made. A certain percentage, in proportion to the sales of the former lease, is either added to or taken from it, as the rent of the lease ensuing; this is offered for the acceptance of the tenant, and if he has a son to succeed him, behaves well, and can pay his rent, he is never removed. In this way, let the leases be what length they may, improvements are constantly carrying on: farms become a kind of life-rent property to the possessors, who improve them for their children's children, and yet it is understood that the Duke's farms are not, on the whole, cheaper than others. But the security of the system is all the charm. In the building of houses, the Duke gives wood, slate, and lime; but the carriage of these from the places where they are usually sold, and all the other expenses of building and finishing, are the work of the tenant. On farms differently constituted, every permanent improvement ought to be made by the landlord. In general the farm buildings on the Duke's estates in Eskdale are commodious and in good repair; and I add with pleasure, that the paternal interest which the family of Buccleuch has taken in the welfare of its tenantry, is gratefully felt by the latter, and has a powerful effect on their general character. Few are more honourable in their dealings or better informed.

**DRAINING.**—The most general improvement on sheep here is surface draining. The drains are made from 16 inches to 2 feet wide, and 1 foot deep at an average. The expense of making them is from 6s to 7s 6d per 100 roods of 18 feet each; and when the soil, after some years, has become compressed, and the sides of the drains having become to meet, they are commonly widened and cleaned out for from 4s to 5s per 100 roods. A considerable degree of skill is requisite in laying them on. If they run too slow, they cannot clear themselves of flying bent and other impurities; and if too rapid they run into gullies. The best rate of motion is a medium between these two. Experience has taught that they should be of considerable length to collect a sufficient quantity of water for keeping them clear; and, where the ground will allow it, they are commonly made to run up the water rather than down; that is to say, when drawing the wet side of the hill, facing the east, for instance, with a burn running south at the bottom,—in

place of beginning the drains at the north end, in a parallel direction from north to south, as the burn runs,—it is better to begin them at the south end of the hill, and make them run north into some ravine or syke on that side communicating with the burn. You can thus make the draining more level, by having gained the difference of level on the north end above that on the south. The advantages of these drains, on sheep farms containing much bog, are incalculable.—The grounds which retain the wet after rain, or were locked up by every frost, by having their surface moisture quickly carried off, afford a dry bed for the sheep, and better grasses for their support, and have banished the most destructive of all diseases, the rot. In this parish, there are on some of the farms between 30 and 40,000 roods of these drains; and in the whole parish, there are nearly 400,000 roods of drains.

**EMBANKING.**—But, besides surface drains on hill lands, the straightening and embanking of Black and White Esks, with several of their tributary streams, have been of material advantage. There is a long embankment of the Black Esk on the farm of Killburn, and one of shorter dimensions, of the Gerwald water, below Thick-side; but the principal one is that of the White Esk on the farms of Nether Cassock, Davington, and Burncleuch, extending to nearly two miles, and done at great expense. By it, an extensive holm or haugh, of more than 100 acres, which, in many places, was a sour swamp and much overflowed every flood by the river, has been dried and rendered productive both for crops and hay.

**MOLE-CATCHING.**—Mole-catching, which in my (the Rev. Dr. Brown lately deceased,) former account, was merely mentioned as a thing proposed, was in the summer of 1797 carried into effect, on the whole of the Duke of Buccleuch's farms in the south county. Messrs Fleming and Thompson from Lancashire undertook to catch, for 14 years from that date, on the following conditions:—For every 100 acres of arable land, 10s annually for each of the first three years, and 5s annually for each of the remaining eleven; and for every 100 acres of sheep pasture, 8s 4d annually for each of the first three years, and 4s 2d for each of the remaining eleven. This plan is continued still, but at a lower rate; for the first fourteen years required four times the number of hands that are needed now. As everything on the Duke's estate is done systematically, the proportion due by each farmer is paid at the rent day to the chamberlain, after deducting the board of the mole-catcher, and handed over to Mr. Fleming, who regularly attends. Several other proprietors have agreed with Mr. Fleming, at the Duke's rates. One advantage is obvious to the most superficial observer. Before the moles were caught, their usual run was along the back of the drains, where the ground was driest, and often into the drains,—the consequence of which was, that every flood sending out water through these holes spread the mole hills over the ground beneath, causing that rich soft grass to arise, which, in spring, might do no injury, but was dangerous in autumn for the introduction of rot.

In 1798, His Grace Henry of Buccleuch, knowing the advantages of flat flooding on the meadows, and catch-work, as it is technically called, on sloping grounds in several of the counties in England,—engaged Mr. Stephens to assist any of his farmers who were so inclined in laying down land regularly for water meadow. A considerable number profited by his Grace's offer; and the whole of the meadows so operated on have been accurately reported by Dr. Singer, at the request of the Highland Society, and the report published by them in the third volume of their Transactions. There were no water meadow in this parish except two acres of catch-work on the glebe; which, although supplied by a mountain rivulet of very inferior quality, were visibly enriched,—the poor barren soil being converted into rich black mould. In general, the objections against the system were—the small quantity of ground that could be spared from the sheep or the plough,—the abundance of hay either from meadow or bog,—and the poverty of the water when compared with that

which passes through the rich manufacturing districts of England. The hay too was thought good for cattle but not for horses; and of fodder for the latter they stood much in need.

Till the beginning of the present century, it was the practice of farmers, during snow-storms of any great continuance, to fly with their sheep to Annandale. To those living under different circumstances it is scarcely possible to conceive the extent to which this was carried. I select one instance from many from a memorandum taken at the time. "On the 15th of January, 1802, the thaw came which relieved so many thousands of sheep. For a great number of years such a general flying for pasture had not been experienced, although lesser ones have been far from unrequent. Every part of Nidsdale, Annandale, and the lower part of Eskdale, that could take in sheep, was filled with them from Crawfordmuir, Tweedsmuir, Ettrick, and Yarrow, the head of Tiviotdale, Ewes, and Eskdalemuir; and had the frost continued eight days longer, there is no saying what the farmers would have done. Nor was all this owing to the great depth of snow, for it was by no means considerable. The whole of the evil was occasioned by the snow falling wet, or becoming so, and then freezing, which locked up the pastures from the sheep. The common rate per score, for twenty-four hours, even for this imperfect kind of support, was from 10d to 1s 6d." No such things as *flying* in this parish is now ever thought of,—the pastures in Annandale, to whom they usually fled, having in many places been subdivided and inclosed. Hay parks were begun at home. The dung, which lay useless formerly, was employed to enrich them. This gave a considerable quantity of led hay for the sheep; and in addition to this, it was found that the better kind of bog hay when well got, could subsist sheep very well till the thaw came. In place therefore of their being hungered before they went to Annandale, half-starved while there, and half-drowned in the burns on their way home when the thaw came, they continue at home, thrive better, and much money is saved to the farmer.

An additional fund of support for young cattle and sheep has lately been introduced into this parish from Liddesdale by Mr. James Elliot, tenant at Yethyre, in moving the flying bent and converting it into hay. Before he began the practice, it was allowed to wither, to be carried about by the winds, and stop the current of the drains. It is not so nutritive as bog hay, but if cut early when full of sap, it is far from being despicable:—and what adds to its value is, that it is found on farms where bog hay is not abundant.—*New Statistical Account.*

### PRESENTATION OF A PIECE OF PLATE TO LORD DOUGLAS.

A few weeks since, the tenantry on the Douglas estates in the Upper Ward of Lanarkshire, came to the resolution of presenting a piece of plate to their noble landlord, in testimony of their high respect for his general character, and particularly of their gratitude for his kind and generous attention at all times to their welfare. With such promptitude and zeal was the proposal entered into, that within five days upwards of 200l were subscribed; and twice that sum, if required, would have been as readily obtained. Highly gratified by this proof of their good feeling towards him, his Lordship most readily accepted the invitation of this respectable portion of his tenantry, to receive the piece of plate at Douglas Castle on the 25th of March—his birth-day. Friday, accordingly, was a proud day for Douglas. About two o'clock p. m. the subscribers, having assembled at the Douglas Arms Inn, Douglas, went in procession, preceded by the Douglas band, in their handsome new uniforms, to the Castle, on the green, in front of which seats had been ranged in the form of a semi-circle for their accommodation. On a table

in the centre of the green, was placed the plate, surmounted by a tasteful canopy. Stormy and cold as the day was, the concourse of spectators was very great, including a number of strangers, not only from the neighbouring parishes, but from Lanark, Glasgow, and Edinburgh. Almost every lady of respectability in the vicinity was present; and being accommodated with seats in front of the table, presented a range of beauty which was not the least interesting part of the exhibition. When Lord Douglas made his appearance, accompanied by his brother the Hon. Captain George Douglas, the air rung with acclamations. On his Lordship's advancing to the centre of the green, Mr. Gillespie of Parkhall, presented the plate to his Lordship, accompanied by the following address:—

"My Lord Douglas,—In the name of your Lordship's tenantry on the Douglas estates in the Upper Ward of Lanarkshire, I have the honour of presenting to your Lordship this piece of plate, in testimony of our gratitude and respect for your Lordship as a generous landlord and an upright nobleman; and that your Lordship may long live to preside over your extensive estates is the sincere wish of us all." Wine being handed round, Mr. Gillespie proceeded—"Gentlemen, I beg to give the health of our noble landlord, and many happy returns of the 25th of March."

When the enthusiastic cheers had subsided, with which this address and toast were followed, his Lordship replied in a tone of animation and warmth which delighted all present. He expressed himself very highly gratified by the honour they had done him in presenting him with so handsome a piece of plate—he esteemed it very highly—and while he returned them his warmest thanks, he begged to assure them that he would always be happy to show them any kindness in his power. His Lordship then gave the following toasts, every one being followed by the loudest acclamations, and by a discharge of guns from the battlements of the Castle:—"The King," "The Queen, and the other branches of the Royal family;" "The Tenantry of Scotland, and may the industrious farmer always meet with encouragement, and be rewarded by a generous landlord." "And now, gentlemen," said his Lordship, "I beg to give 'the Tenants of this estate in particular,' and to return them my best thanks for the very magnificent and splendid present which they have this day so handsomely offered to me." He then bowed gracefully to the ladies, and said, "I beg to propose a bumper to the ladies who have honoured me on this occasion with their presence—your husbands and sweethearts—long life and happiness to you all."

It was a most interesting and gratifying sight to see this kind-hearted nobleman, surrounded by upwards of a hundred warmly attached tenants, and exchanging with them the most cordial expressions of regard. He was quite buoyed with feeling; and nothing could exceed the lively cheerfulness of his manner—his countenance beaming with the kind and joyful feelings of which his heart was full—except, perhaps, the sympathetic delight which he infused into every heart. It was such a scene as few can have the happy lot to witness, and none who did witness it can ever forget.

The plate, all of the most massive silver, consists of an epergne, with four branches, on four lion's claws. The branches, two sides of the epergne, and the claws, being of beautiful frost work. The epergne is supported on a large salver, very richly chased, with four lion's claws, all of the most exquisite workmanship. On one side of the epergne, and on the upper side of the salver, are the family arms, most

beautifully engraved. On the other side of the epergne, and on the reverse of the salver, is the inscription, arranged thus :—

Presented to  
The Right Honourable ARCHIBALD LORD DOUGLAS,  
of Douglas,  
By the Tenantry on the Douglas Estates in the Upper  
Ward of Lanarkshire,  
As a Tribute of Respect and Gratitude,  
To a Nobleman, who,  
With Virtues worthy of the high name of Douglas,  
Has shown himself,  
In kind and generous attention  
To the  
Welfare of his Tenantry,  
*Jamais Arriere,*  
(“ Never behind ”—the family motto.)

The whole did great credit to Messrs. Mackay and Cunningham of Edinburgh, by whom the plate was furnished.

From the Castle the tenantry proceeded to Douglas Mill Inn, where about 120 sat down to a sumptuous dinner. A little past four o'clock, the chair was taken by Mr. Scott, his Lordship's factor. The Rev. Alexander Stewart and Mr. Black of Hazleside, acted as croupiers. The leading toast of the day, given by the Chairman in a speech replete with feeling, was received with long protracted and reiterated cheers. Next followed the Hon. Charles Douglas, proposed by Mr. Stewart—the Hon. and Rev. James Douglas—the Hon. Captain George Douglas—Lady Montague—Lady Scott, and the other ladies of the Douglas family—which were received with equal enthusiasm. Most cordial, too, was the response, when Mr. Stewart proposed the health of the Chairman, with a well-delivered tribute to his merits as factor, and when the health of Sir F. W. Drummond, agent for Lord Douglas, was also given by Mr. Stewart. Many excellent speeches were delivered in the course of the evening, which was likewise enlivened with some good singing; and every heart being in full harmony with the happy feelings that had brought them together, the meeting was altogether delightful.

On the same day, at Bothwell Castle, considerably more than 200 persons, mostly the tenantry of his Lordship, met to celebrate the event. No disinterested person present could fail witnessing the joy and happiness evidently visible in the countenances of the crowds at the Farm and Castle. Dancing was kept up with the greatest spirit until two o'clock A. M., when the parties separated, highly pleased, and truly grateful for the kindness awarded to them by the noble Lord, and who all gave their good wishes and blessings to the noble family of the Douglas.

## PROSPECTS OF AGRICULTURE IN 1836.

SIR,—In my last I adverted to the currency question :—the law of supply and demand; and the Irish poor laws, and in reviewing the other remedies proposed for the depression which exists, I will next revert to the malt-tax. This was a great favourite with a large portion of the agriculturists some two years ago, and so far was perseverance carried on the part of the friends of the farmer, as to procure the remission of one-half of it, which vote was rescinded the next evening. I must confess, sir, and I do it without shame, for we ought never to be ashamed of owning ourselves wrong, that my opinions on that subject are altered, and not entirely from the arguments of Sir R. Peel,

which were very strong, but from a fair and impartial consideration of the measure. One of its alleged benefits was an increase in the price of barley. I doubt however whether it would have that effect;—the increased demand would cause increased production; for the means of production are absolutely illimitable, and it is probable that barley would lower in price in consequence, as was the case with the beer bill, which instead of effecting the desired object, has been a source of demoralization to the working classes, and it is contrary to experience to aver, that the first-named measure would be favourable to public morals. It is a luxury, and consequently a fit object of taxation, for the revenue must be raised from some quarter. Possibly however it might relieve the wheat markets, by employing an increased portion of the wheat-growing land. There is, I think, little probability of its remission;—public sentiment is evidently taking another turn, and the difficulty of finding a substitute for it, will cause it always to be opposed by the ministry of the day. If any reduction takes place, it must be *the whole*, or it will only be a boon to those overgrown monopolists, the maltsters.

Of late there has been an opinion gaining ground, that the large farm-system is not only injurious to the community, but also productive of agricultural distress. Articles on the subject have appeared in the metropolitan and provincial press, and private abusive letters have been sent to certain influential journalists of the former class, for inserting them; but when offers were made for the discussion of the question, they declined. I will not now recapitulate the arguments which are urged against them, but observe, that if there is anything at all of truth in the statements, they deserve attention, because they can so easily put the recommendations of reducing the size of farms into practice, without legislative interference, although even that may be ultimately necessary, to check the present monopolising system. It is alleged that they cause an increase in the poor-rates;—a less consumption of farm produce, and an uncertainty in the markets. Landowners can reduce the size of farms to the maximum of one hundred and fifty acres, and agriculture would be improved, and prosperity increased by that means. Among the advocates for the moderate size system, I may observe, are Parkinsen, Evans, Forembly, &c., &c.

Much discussion has taken place in the agricultural world with respect to the illicit importation of foreign corn, through the Channel Islands, and the colonies, and it has been declared that there is no foundation for the reports. True or false, there can be little doubt that corn is admitted into the islands *for their own consumption*, and as they send us their own corn to sell in our markets and thus make a kind of exchange, which of course is tantamount to bringing foreign corn, but I am glad to observe that the Jersey farmers are uniting to oppose its admission, urging that it deteriorates the sale of their own produce. Should they be able to carry this into effect, the traffic must be speedily stopped, as the trifling advantage of price obtained at present will not hold out sufficient temptation to run the risk of detection.

A plan is now in agitation: to bring the 500,000 quarters of corn which is now in our bonded warehouses, into the country to grind for exportation to the West Indies and South America, which have until of late got their supplies from the United States, and partly from Canada, and as a—what shall I call it, bribe?—no :—they offer the offer to

the government! This plan will be most ruinous to the English farmer, for besides the liability to fraud which it will lay open, the ofal will come in contact with our barley, &c., and cause a further reduction in the prices of the inferior kinds. The plan was tried in 1825, and failed most miserably, and every farmer should immediately and strenuously oppose it. I think I have now gone over the list of proposed schemes which have been proposed to relieve agricultural distress, and have investigated all upon their own merits as impartially as I can, and the most speedy, easy, and certain relief for agriculture I think are,—the giving of *poor laws to Ireland—a reduction of the size, or a division of large farms, and an equitable settlement of the Irish tithe question*, which must however be done, without neglecting to attend to other measures, and especially investigation into truth. I hope a searching investigation will be instituted by parliament, and that it will not confine its labours to the *metropolis* or to *voluntary evidence* only, but come amongst the farmers and examine all classes, labourers as well;—all possess some little stock of knowledge which may be useful and lead to valuable results.

I now come to the next consideration,—prices. The prospects upon the whole are I hope not, worse than the past. I think after the fullest investigation to the subject, which I am capable of giving it, that in times of low prices, the following principle will be found generally to regulate prices. Any article which is selling at rates disproportionate to the rest, will, the succeeding year, in consequence of increased competition, generally either come to the level with the rest, or below it, and *vice versa*. Applying this principle to wheat, I anticipate its price to advance after the harvest of 1836, should the crop be only average, in consequence of the wheat-growing land being used for the growth of barley and other grain. Still this will not operate to the extent of any considerable increase in price, so much old corn remaining on hand, but I think it will be sensibly felt. Barley, though not relatively dear, is at least better sale than wheat, and the land which is reserved for it, is in extent beyond all precedent. Should the crop be anything like an average one, a glut in the market, and depression of prices, may be reasonably anticipated. The demand for oats has been somewhat brisk, owing to speculation, but these will come into market, and cause the price to fall. Beef will probably be about stationary, excepting during the spring, when the deficiency in the turnip crop in the south, will be principally felt, and before the grass will have sprung. Mutton has of late advanced in price, and may be expected to be still dearer the ensuing spring, from the above-mentioned cause; but considering the fair prices at which wool and mutton have been sold during the last two years, and now when the deficiency from the rot is supplied,—should the food prove plentiful, we may anticipate a falling in the markets, and an abundant supply.

In conclusion however, I may observe, that in no profession is there more difficulty of prognosticating the probable sale of any one article of produce, any considerable period beforehand, than farming;—so much depends on the crops and the seasons, as well as the stock on hand, and disposition to sell, which in agricultural concerns especially, are the most difficult to ascertain. W. E. N.

Since the above was written, I am glad to observe that the plan does not meet with the sanction of government.

## ACCIDENTAL DIVISION OF THE FLEXOR TENDON OF THE HIND LEG—PERFECT CURE.

By Mr. J. HAYES.

(From the *Veterinarian*.)

On the 6th of February, 1825, I was sent for to Mr. Loyd's, Oldfield Hall, near Altrincham, Cheshire, in which place I then resided. Mr. Loyd had started that morning in his one-horse phaeton, to go to Manchester. When he had got about one mile on the road, the horse took fright, and dashed to the other side of the road, where, coming in contact with some heaps of broken stones, he upset the vehicle, and by his kicking and struggling, completely divided the flexor tendon of the left hind leg, about four inches above the large pastern joint. They managed to get him home with great difficulty. When he walked or stood, the superior pastern joint was resting on the ground, the foot lying with the heel on the ground, and the toe turned uppermost in front of the leg. The opinion of the people about him was, that he should be destroyed; but he being a fine animal, and a favourite one also, Mr. L. was reluctant to give the order. I explained to him the nature of the accident, and what was the general opinion of veterinarians on divided tendon; and I added, I had a doubt on my mind as to the supposed improbability or impossibility of uniting a ruptured tendon, although I was fully aware of the difficulty of the case. I had never seen or heard of the experiment being fairly tried; but expressed a desire to attempt it, and said that if he would allow me to do so, I would charge nothing if the result was unfavourable; to which he readily assented.

I first got a very strong shoe made, with the heels continuing up the posterior part of the pasterns, as far as the great pastern joint, where the two heels, as it were, joined together, and formed a strong iron stay, which continued up the posterior part of the shank, as high as the hock joint. This was made so as to hold the leg, and bear standing on, in the same position as a leg in its proper sound state. This stay was well padded on the inside; with loop-holes made in three different parts of it, for padded straps to go through and buckle round the leg.

Thus the two ends of the tendon were brought together, and a little tow dipped in balsamic tincture was applied firmly to the wound by a thin bandage. The show with the stay was nailed to the foot, and firmly buckled to the leg. The leg was fomented three times a-day. I abstracted some blood, and gave him two mild doses of physic, followed by a little fever medicine; dressing the wound once in two days, until the beginning of March, when, the wound being healed, I put a large charge on the leg, and buckled on the stay as before: this was suffered to remain until May, when I ordered shoe, stay, and all to be taken off. I then blistered the leg, and turned the animal out to grass, where he remained until the middle of July; he was then taken up and put to work as before, with not the least perceptible lameness. He remained sound afterwards, although they kept and worked him regularly in the same manner as their other horses for six or seven years.

I should have stated, in a former part of this narrative, that on the second day after the accident, Mr. L. met with a veterinary surgeon, since deceased, who happened to be going that way, and mentioned the circumstance to him; and that he, in a very knowing manner, told Mr. L. that it was quite impossible that the tendon could join together again, so

as to be of any service afterwards; but he would see it, and if he found the tendon to be divided, he should at once recommend Mr. Loyd to have the horse shot. Mr. L., with much good and kind feeling, immediately sent for me to be present at the examination. I came; the bandages were taken off; he examined the wound, and immediately declared that the tendon was actually cut in two, and that it was as impossible to unite it again, so as to be of any service, as it was to make a new leg. He then took me on one side, and told me I must be a fool to attempt any such thing; for he could assure me that it had been tried by many of the principal veterinary practitioners, and had never yet succeeded; and that it would lose me the confidence of my employers by its failure, &c. I replied, that I believed his intentions were good, for which I thanked him; but though his name, his age, and his experience, must have great weight, yet I neither did nor would pin my faith or my practice upon any man's sleeve: that I was determined, if Mr. Loyd would keep his agreement, I would persevere, and give the case a fair trial, and then I should be satisfied, but not until then. The result of the experiment was, in due time, communicated by Mr. L. to this surgeon; and I am sorry that it caused a lasting alienation between us.

### PHRENTIS, OR INFLAMMATION OF THE BRAIN, IN SWINE.

MR. EDITOR,—Although the veterinary art embraces nominally the treatment of all animals requiring medical or surgical assistance, yet it is a well-known fact, that with the exception of the horse, no other animal has been considered sufficiently important to merit the particular attention of investigating by scientific veterinarians; it is true that the dog and neat cattle have been slightly noticed by Blaine, Clater, and others, but sheep and swine, animals not the least useful of the grazer's stock, have been passed by nearly unheeded. This circumstance has induced me to lay before you the following case, and should you think it deserving of insertion in your publication, you are at liberty to lay it before the public.

A store pig of mine weighing about five stones, which had been living on the usual kitchen refuse, and a little stale milk, was first noticed on Wednesday morning last to be walking round its yard apparently much discontented and thin, and anxious to get away from its yard; it also refused its food. Not thinking the case of particular importance, I paid no further attention to the circumstance until after my man had been to attend to it in the evening, who found the animal a good deal convulsed; when I saw it the convulsions were over, but the pig was blind. Having paid but little attention to this branch of the veterinary art, I called in the assistance of an individual that was considered by many of his neighbours as "very learned" in the treatment of pigs. In conformity with his wishes, two inches were abstracted from the length of the pig's tail, both its ears slit, and the parts left bleeding; on the following morning, as the animal was not better, it was bled in the mouth. This (the usual treatment in all such cases) being of no essential service, and the animal getting worse, I thought it necessary to take the case into my own hands. The convulsions, blindness, and prostration of strength, I considered to be owing to an affection of the brain, which symptoms were aggravated by considerable constipation of the bowels; the case had evidently been delayed too long, and the treatment I pursued was more of an experimental

kind, than with any hope of producing a favourable result. The common means for evacuating the bowels not having succeeded, I gave the following drench in a little thickened milk:—

Croton oil, 2 drops.

Tincture of ginger, 1 dram.

Simple syrup, 2 ounces.

The drench was repeated after an interval of nine hours: the first dose brought away some feces very much hardened, and the animal appeared relieved, the convulsions being less violent and not so frequent; the last dose caused a relaxed state of the bowels on the following morning, but thinking them not sufficiently operated upon, an ounce of sulphur was given in a pint and a half of thickened milk. With all the attention which it received the animal did not live long after taking the sulphur, the system evidently having been too much exhausted before active treatment was resorted to. On examination after death, the brain showed extensive marks of active inflammation.

The observations that I made on the case and on the effects of the treatment, would in a similar case induce me in an early stage of it to pursue the following treatment, which I would also recommend to the public in general as being most likely to check the disease, and restore the animal to health, and which is practicable by any individual. The first thing to be done would be to bleed largely from a vein in the fore leg (the brachial, or as known to farriers in the horse by the name of the plate vein); this vein runs along the inner side of the fore leg immediately under the skin; and, the best place for opening it, is about one inch above the knee, and scarcely half an inch backwards from the bone (radius), as no danger need be apprehended from cutting two or three times, if not successful at first in getting blood, by tying firmly around the leg just below the shoulder a ligature of tape, the vein will be more readily discerned, and the flow of blood greater. The palatine veins which run on both sides of the roof of the mouth, should also be opened, by making two incisions, one on each side of the palate, about halfway between the centre of the roof of the mouth, and the teeth. A drench similar to the one already prescribed I should also give, varying the dose of Croton oil from one to three drops, according to circumstances and the size of the pig. The tincture of ginger acts as an aromatic, and also dissolves the oil; if necessary the dose should be repeated every twelve hours for two or three times, until the bowels are well acted upon. (Sulphur, although a good aperient, in general cases may be used as an auxiliary, but must not be depended upon for producing a certain and quick effect like to Croton oil, in important and dangerous cases.) The head should be kept cold bathed, by tying round it a piece of cloth, and by frequently pouring the following cold lotion upon it:—

Sal ammoniac, 1 ounce.

Strong vinegar, 1 pint.

Cold water, 2 quarts.

To be mixed together. Should this treatment not prove sufficiently effective although the bowels might be opened, I would attempt blistering on the back of the neck, and would give internally powdered hellebore\* in two grain doses, two or three times a day,

\* Hellebore is generally used by pig doctors for pegging their patients with, in a variety of complaints, and the good which frequently results from this mode of treatment, is to be attributed I consider more to the nausea which its causes, by being absorbed into the system, than by the local irritation which it produces.

until the animal was nauseated, which would be known by its "slavering" at the mouth; the effect of nausea on the animal system is the reducing of arterial action, or perhaps in more comprehensive words, lessening the power of the circulation.

The principle of this treatment throughout, will be perceived to be the reduction of excessive vascular action, either by depletion (blood letting), purging, counter irritation or nausea, or by all conjointly; and on this principle only can the disease be scientifically and successfully combated.

Hoping that the diseases of no animal will be considered as undeserving of scientific investigation or inquiry, and wishing that this case may serve as a nucleus, around which many facts may be gathered, whereby animal suffering may be reduced, and individual loss to a considerable extent prevented,

I am, Mr. Editor, yours, &c.

FRANCIS CUISS, V. S.

Diss, Norfolk, April 6, 1836.

### AN ACCOUNT OF THE FLOUR MILLS AT ROCHESTER—UNITED STATES OF AMERICA.

Amid the multitude of machinery with which the river Genesee is studded, the flour establishments are conspicuous. There are now within the city of Rochester twenty-one mills, with ninety-five runs of stone, capable of manufacturing five thousand barrels per day. Twenty thousand bushels of wheat are daily required for these mills when in full operation. The immense consumption of the raw material occasioned by such an extensive manufacture furnishes to the rich wheat growing region around Rochester a ready market, while it draws considerable supplies from the shores of Erie and Ontario. Besides the wheat drawn from the surrounding country and from Ohio, some of the Rochester millers imported in 1835 from Canada (subject to heavy duty) about 100,000 bushels. Three of the above-mentioned mills have been erected last year, and considerable improvement has been made in some of the others. These three mills contain seventeen runs, which with the seventy-eight runs in the other eighteen mills, forms the total of ninety-five runs. Some of the Rochester mills are on a scale of magnitude unsurpassed in the world; all are considered first-rate in the perfection of their machinery, and so effective is the whole Flouring apparatus, that there are several single runs of stone which can grind (and the machinery connected therewith, bolt and pack) one hundred barrels of flour per day! and such is the character and extensive demand for the article, that besides the quantity shipped for foreign countries, the "Rochester brands" may be seen equally at Montreal or Washington—at Quebec or New York—at Boston, Hartford, Charleston, or New Orleans. The total amount of capital invested in the twenty-one mills exceeds half a million of dollars (540,000) as was ascertained on a late accurate examination by Thomas H. Rochester, Esq., one of a committee appointed by the Common Council to collect the statistics of the city. Williams's "Annual Register" for 1835, mentions the Rochester mills as only fourteen in number, with sixty-four runs of stone; but, by the statement here made, it will be seen that the mills are one-third more numerous, and the capital invested about double the amount given in the Register. The avidity with which mill property has been sought, and the additions made to it during the

present season, indicate clearly strong confidence in its permanent worth.

The water power at the two great falls at Rochester is estimated as equal to 1920 steam engines of twenty horse power. The total value of this water power, calculated according to the cost of steam power in England, is almost incredible to those unacquainted with such subjects—amounting, as it would, to nearly ten millions of dollars (9,718,272) for its annual use!

When in connection with this vast water power we consider the great facilities which Rochester enjoys (by lake, canal, and river) for receiving wheat and other raw materials from, and shipping flour and other manufactures for, all desirable points either in the United States or the Canadas, we may more fully appreciate the importance of the present milling and manufacturing establishments, and confidently anticipate the continued prosperity and protective greatness of the city of Rochester.

HEALTH OF HOP-GROWERS.—Those who have been habitually engaged in hop-growing, have been so uniformly in good health, as to have attracted the attention of the medical philosophers. In the burning districts, so called, in England, in which from three to four thousand people are exclusively employed in the various preparations of hops, there has been but one death for a long period. Formerly the business was deemed unhealthy, and Mr. Ellis, a very humane gentleman, engaged, at his own personal expense, the services of a physician to be constantly in attendance at East Farley, another famous hop-raising place. So far as observation has been made in the United States, an equal share of good health has been meted out to all grades of hop-growers.—*American med. journal.*

EXPORTATION OF WHEAT TO CANADA.—A few years since a proposition to send corn to Canada would have been treated as that of a proposal to send coals to Newcastle—but "Time makes fools of us all;" and what would lately have been considered next to an insane adventure is now held to be a safe speculation. When in Bo'sness the other day, we saw a number of carters and porters actively employed in loading with wheat, for Montreal, the fine brig *Atlas*, of Kirkaldy—to sail on Sunday. The entire cargo of the vessel will be wheat, which has been in bond, we believe, these two years.—*Scotsman.*

The consumption of oxen in Paris during 1834 was 68,408, of cows 15,290, of calves 60,237, and of sheep 306,227. A curious observer on these subjects has ascertained the annual consumption of the above articles of food for the seventeen years from 1760 to 1777, and calculated that the average was 66,784 oxen, 20,977 cows, and 107,945 calves, and 332,920 sheep. The number of oxen killed in 1834 was greater than in the above average, but this was not the case with respect to the cows, calves, and sheep. In fact there was an increase of 1,624 oxen, while there was a decrease of 5,687 cows, 47,708 calves, and 26,694 sheep. The consumption of butcher's meat in London is much more considerable than at Paris. According to statements given it amounts annually to 150,000 oxen, 50,000 calves, 700,000 sheep, and 250,000 lambs. It is observable, that the consumption of meat in Paris has not augmented in proportion to the increase of its population, which may be judged of by the following figures. In 1760, there were in Paris 3,787 marriages, 17,991 births, 18,531 deaths, and 5,031 foundlings. In 1831, there were 8,094 marriages, 19,119 births, 23,015 deaths, and 9,987 foundlings.—*Galvani's Messenger.*

MILLERS AND BAKERS IN FRANCE.

The following replies, which appear in the *Echo*, the principal agricultural paper published in Paris, to various queries forwarded the Editor, respecting the system adopted of fixing the assize on bread, and also the price of flour from the miller to the baker, elicit some interesting details, which would not be very palatable to our London millers, if adopted in the British metropolis. It is asked "how much bread the Parisian baker, obtains from a sack of flour of the first quality weighing 159 kilogrammes, which allowing 2 kilogs for the sack, leaves 157 kilogs., nett, or about 346lbs English?" To which it is replied,—The government calculation from which the tax or assize is levied at Paris, is estimated, that the 157 kilogs of flour will return 102 loaves of 2 kilogs. This mode of calculation has been objected to by the bakers, on account of the quality of wheat and yield of flour varying according to the harvest, though on an average season, the above estimation is acknowledged to be as near the reality as possible. Again—What is the price adopted between miller and baker on selling a sack of flour for making into bread?—It is answered—The law allows to the baker 11 francs per sack for all expenses, as baking, wages, &c.—that is to say, in addition to the average price of flour fixed by the comptroller of the market, which remains stationary for a fortnight, 11 francs are charged as a representative of the expenses of manufacture. Thus, if the average price of flour is fixed at 40 francs per sack, 11 francs are added, making the total 51 francs; and taking the estimate of 102 loaves of 2 kilogs—the price of each loaf is fixed at half a franc or 50 cents, making 51 francs. By this assize therefore, the miller and baker are guided in their transactions in what is termed *les marchés à cuisson*. The miller sells to the baker at a certain period for delivery, and at prices to be stipulated also at a certain time, according to the legal price of bread, with 9, 10, 11, or 12 francs according to agreement allowed by the miller for the *cuisson*, or baking expenses. In order to ascertain the price to be paid the miller, and the discount allowed the baker, the *custom of the trade* is, to calculate that the sack of flour makes one hundred loaves of 2 kilogs, therefore the miller sells his flour we will say with 10 francs deduction for the *cuisson*, deliverable on the 1st of February; on that day, the assize of bread is 53½ cents per 2 kilogs; the baker consequently pays as follows:—

100 loaves made from a sack of	} francs.	cents.
flour at 52½ cents each loaf		
Deduct the baking expenses allowed the baker	} 10	
Leaves for the miller		42

Nothing therefore, is more easy than to establish in this manner the price of flour.

HORTICULTURE—ASPARAGUS, SEA-KALE, RHUBARB, ARTICHOKE.

By Mr. J. Towers, Author of the Domestic Gardeners Manual, &c. C. M. H. S.

(From the Quarterly Journal of Agriculture.)

It has frequently occurred to me that works on agriculture might, without infringing materially upon the object which they have chiefly in view, be rendered the vehicles of much important horticultural information. The culture of the field and garden

are sister arts, and might go hand in hand together; many also of the products of the garden are grown to a still greater extent in the field, and the same natural agents equally act as stimuli upon both. I have therefore resolved to risk an occasional communication upon the cultivation of the most valuable garden vegetables; and though I profess not to instruct the practised gardener, I indulge the hope that the few hints which are derived from successful practice may not altogether be thrown away, or be unproductive of amusement and information.

In order to render the articles as immediately useful as possible, I intend to confine my remarks as closely as I can to those vegetables or fruits that are in season, or may be raised or cultivated in routine, at those periods which coincide with the publication of one or other of the numbers of this *Journal*; and, in the present instance, as the months of March and April are particularly favourable to the culture of asparagus and sea-kale, I shall, in the first instance, advert to them, and then as far as my limits will admit, refer to one or two other subjects to which a corresponding mode of treatment will apply.

I. ASPARAGUS is a native of the sea shores of Britain, though, according to Dr. Hooker, it is rarely found in Scotland: it is worthless in its native original state, but, as every one knows, is susceptible of the greatest improvement by culture, and becomes highly luxuriant in a richly manured, light, and mellow loam. The young sprouting stems, as they emerge from the soil, are used for the table; and these, if suffered to grow, and become fully developed, form one of the most graceful among the productions of herbaceous vegetation: the numerous branching lateral stalks, produce innumerable tufted, minute leaves, of the most lively and delicate green, at the angles (*axillæ*) of the smaller branches two or three pendulous flowers are situated; they are greenish, bell-shaped, and without any particular odour. Each flower consists of a calyx of six deeply cut segments,—six stamens,—one very short style, and its stigma cut into three divisions,—and a germen, becoming a scarlet globular berry, which contains one or more perfect seeds in its three cells. This plant forms, with others of the same genus, one of the families of the Asphodel tribe, *Asphodelæ* of the natural system. How, and at what period the plant was brought into cultivation, it would now be vain to inquire; but it appears probable that, in England, it was little known before the seventeenth century.

The modes of cultivation practised with a view to bring the vegetable to the highest state of perfection, in the different countries of Europe, are too numerous and complicated to be now allowed to, much less described. It will be my aim to point out two processes by which fine highly-flavoured shoots may be abundantly produced. The one is not so much in fashion as formerly, but it possesses great conveniences; the other is more novel, and perhaps more scientific, as it may be made to conform to the hypothesis of radical exudation. The physiological reader will readily perceive, that, by adopting it, he can introduce other vegetables between every row of his asparagus, and thus avail himself of the nutritive matters which their radical processes yield to the soil: however, I shall simplify my directions, and confine them to the process of *forcing* early asparagus. These will be brought under one view in the succeeding notice of sea-kale.

CULTURE IN BEDS.—This is the method that has been adopted for a number of years, and recommended by most writers; but there exists great difference of opinion as to the way in which the beds ought to be formed. Much of the permanent

success will depend upon the nature of the staple soil; and I hesitate not to say, that, unless the garden afford one which is light, loamy, and free from stones of any considerable size, to the depth of two feet at the least, the whole plot ought to be formed artificially, and the best material for the work is the thin turf of a meadow of short growing grass, or that of a common where sheep abound. Such a soil is replete with vegetable, decomposable matters; and, in fact, is very suitable to the cultivation of every product of the garden, unless it be that of a few vegetables which prefer a stiff soil, or one of an entirely opposite description, and approaching to the nature of sand.

Turf may, however, prove a defective material, if it be produced upon clay or stiff loam; but, in ordinary cases, that of a common or sheep-walk is of a medium texture, and breaks down into a rich light earth, which, while it can be digged and pulverized with freedom, is also sufficiently compact in texture and retentive of moisture. If a store of turf, an inch and a half in thickness, could be readily obtained, I should prefer it to any other species of earth whatever. An asparagus bed is not the work of a day; if well laid out and properly planted, it endures for years, and repays any ordinary cost and exertions; but it would be better not to undertake it at all, than to perform it in an unskillful and slovenly manner. If the soil of the plot selected be already free to the spade, deep, and equable, it may be brought into a state nearly equal to good natural turfy loam, by the liberal addition of a well reduced and black leaf-mould. Having thus premised, I would recommend the formation of two beds by the process now to be described; the one will exhibit the progress of the plant from the seed, and perhaps will form the most perfect plantation; the other will come into full bearing at an earlier period, but not by any means so much so as many persons are apt to imagine.

**PREPARATION OF THE BEDS.**—Select a piece of ground of about thirty feet long, ten feet wide, and open to the full south sun, so that its rays may fall in the direction of the length of the beds. Open a trench, two feet wide at one end, and wheel the earth to the opposite end, or rather to a spot two or three feet beyond it; this implies that the soil is good, otherwise it should be wheeled or carted away, to be employed for other purposes. Have ready, and close by the plot, six cart-loads at the least, of well-wrought leaf-soil, sea-weed, or, in default of either, of perfectly good spit-dung. If fine turf be employed, one half of the above quantity of the *enriching substances* will be sufficient. The first and every succeeding trench is to be digged and cleaned out at the bottom, to the depth of two feet or more, as the good soil may indicate. It has been recommended to trench four and five feet deep, with the assurance that a proportionably great and permanent crop of the asparagus would be produced. I have tried two feet and thirty inches, and believe that a perfectly well enriched soil to that extent, will be more efficient than six feet of a dead, cold substratum. At all events, a good six-inch layer of rich manure should be laid at the bottom of each trench, and the first being cleared and so prepared, the soil and a due proportion of the manure are to be put into it, and mixed as equally as possible, till the earth be raised at least six-inches above the old surface level. Thus the work is to proceed, trench after trench, until the entire plot be filled up with *thoroughly moved and incorporated materials*: the last trench must be filled with the earth out of the first. At this stage of the work it will be found that the

reserved earth will be insufficient to complete the plot; in order, therefore, to equalise the surface, it will be prudent to dig the bed again in a contrary direction after an interval of a week; and previous to this operation, I would recommend that about a gallon of common salt be regularly sprinkled over the whole surface; it will tend to bring the bed into that chemical condition, which a constant dressing of sea-weed would induce.

Having thus described the preparation of the bed, I observe once for all, that if turf be in plenty it cannot be made too deep; and this will hold good in the preparation of all garden plots where *vegetables alone* are to be grown. For *fruit-trees*, I believe that eighteen inches of pure maiden turfy loam, without one particle of animal manure, over a six-inch stratum of coarse stones, brick-bats, rocky fragments, or the like, would be a more fertile medium of growth, and one infinitely more conducive to the health of the tree, than double the depth of a highly enriched garden soil. This digression will be permitted, as it includes a general remark applicable to culture in most departments.

The bed thus double-digged will be ready for cropping, and though it might be as well to have thus prepared the soil during the dry weather of the winter, it will yet be in good time if the work be accomplished during the month of March. After the ground shall have settled for a week, two beds each three feet wide, should be marked out, and this width will admit of an alley between the beds, and one on each side of them, more than a foot in breadth. To form these, strain a line on the outside of the beds, and two down the middle space between them, so as to mark out the limits of the beds, throw the earth out of the alley upon the beds, that their surface level may be six inches above the base of the alleys. If turf be at hand, it would be right to place three inverted well cut turfs the whole length of the alleys, and thus to form good and solid walks; a dressing of salt should then be sprinkled over the turf to prevent the growth of the grass. Some persons use a deep layer of ashes; but whatever be the material employed, the beds ought to be raised a few inches above the walks, not, however, to provide for drainage, but to render the future culture convenient, and to give a finished appearance to the plantation.

**SOWING SEED.**—Early in April and in fine weather, stretch a line three times up and down the bed, by means of stakes driven into each end, exactly one foot apart, and the like distance within the sides; draw three drills an inch and a half deep, with the angle of a hoe, and make the bottom of each drill even, by pressing into it lightly a straight even pole, like the handle of a long rake. Scatter asparagus seed as regularly as possible along the drills, or if the seed be known to be good, three or four seeds may be carefully dropped at inch distances, in spaces nine inches apart: the ultimate object is to obtain one good plant, at every space of nine inches, therefore the good sense of the gardener will guide him so to manage the seed-sowing, as to combine economy of seed and time with security of result. Bad seed taken out of very old berries may perhaps scarcely produce one plant from twenty grains, though the seeds will remain good for three or four years.

When the young plants germinate they should be permitted to grow to the height of three inches, or till the leaves become perfectly developed, and it appear which plant will prove strong. If two arise close together, one should be removed as soon as possible, by means of a flat, sharp-pointed stick, and the whole should be thinned out early, so that there may be a space of two or three inches between plant

and plant. The spaces between the rows must be kept clean by passing a flat or Dutch hoe cautiously over the surface, and as the plants acquire strength they may be thinned out to four inches apart; but it would be rather imprudent to attempt a more severe thinning-out during the first year and till the winter pass over, as it will be impossible to decide to what extent extreme moisture of the ground, frost, snow, and other enemies may prove destructive during the torpid season. If the plants stand the winter well, the supernumeraries may be employed to great advantage; but of the use to which they may be turned, and, indeed, of the treatment of the seed-bed during autumn, nothing need now be said.

**PLANTING ASPARAGUS BEDS.**—This is the method usually adopted, and plants two years old from the sowing are generally recommended. I believe that the age is of little consequence as far as security may be considered; and that, three or four year old plants may be employed when it is the object to obtain produce within the period of twelve or fifteen months. Yearly plants are safe also, and these may be planted four inches apart in shallow trenches, or open drills, cut with a spade along lines stretched very tight, and at the distances mentioned before. The plants should be placed so deep as to permit the crowns to be covered with two inches of fine earth, and the roots ought to be let down to their full extent into the ground in a rather open and expanded order, and be perfectly coated, and in contact with the soil. Dry weather at the close of March, or early in April, should be chosen; because the earth, when it is in a free and open condition, may readily be made to fall among the stringy processes of the roots; but when planted, each row should be liberally watered once, to fix the plants securely, and to enable them to start into growth without any loss of time. The routine culture of the beds will be in all respects similar to that before described; and if blanks occur in consequence of the decay of some of the roots, they may be filled up with young growing plants, as late even as the middle of June; provided that each be raised from the seed, or nursery-bed, without injury, and be set immediately during cloudy weather, or in the evening, and copiously watered. The second method of planting, with a view to forcing, will be described hereafter. I defer any farther observations for the present, as respects the general routine culture, merely remarking that, from *seed-beds*, in carefully prepared ground, I have cut very good asparagus in two years, that is, in the third season after the sowing.

**II. SEA-KALE** (*Crambe maritima*) is found on our sea-coasts; it belongs to that natural order which includes all the cruciform flowers (*Crucifera*): the stamens are six in number, two of which are shorter than the others; hence the plant is classed in *Tetradymia*, and is found in its first order, *Siliculosa*: the seed vessel or "pouch" is round, smooth, and about the size of a black currant. The root of the native plant—according to Sir J. E. Smith—is large and fleshy, much divided at the crown. *Herb* very glaucous (*sea-green*), smooth, rather succulent. *Stems* several, from one to two feet high, branched, spreading, leafy. *Leaves* stalked, spreading, or deflexed, large, undulated, and toothed, of a leathery "*coriaceous*" texture; the lowermost somewhat lyrate; the rest roundish acute." *Flowers* in dense terminal clusters, milk-white, yellowish in the centre, *fragrant*. This description accords sufficiently with the appearance of the cultivated plant; and in fact, it is known that the inhabitants of the countries where it grows wild on the shores, have always been in the habit of observing the first progress of the

young shoots as they emerge from the sand, and of cutting them under the surface. In this state they are merely a species of green kale; but by culture the shoots become a most delicate vegetable, which, while it precedes asparagus, combines much of its peculiar flavour with that of the best borecole, or *chou de Milan*. *Sea-kale* was introduced to the gardens about seventy years ago; it is now found in all the best establishments; and its culture, though peculiar, is as easy as the plant is prolific. It can be raised from seeds, and be brought to the table early in the second year. By transplanting, and division of the shoots and roots, it may be propagated abundantly, and at any season of the year, and is so hardy as to withstand any common degree of frost.—The *Soil*, as indicated by its native situation and habits, should be light and sandy, with a slight addition of mild lime, muriate of soda, and wood ashes. The beds ought to be prepared as for asparagus; and of a light sandy turf, with a natural manuring of sea-weed alone, or artificially—with one-fourth of a compost consisting of a perfectly reduced fern, or leaf-mould, nine parts—wood-ashes, one part—and about half a pound of common salt to every barrow-load of the compost. This last chemical compound contains a large proportion of the components of sea-water, and the wood-ashes yield carbonate of lime in its most effective state, also some carbonate of potassa, and fine silix. Three barrows of light sandy turf, and one barrow of the above compost, give proportions which promise to yield a medium of growth of the most permanent and effective character. In it sea-kale and asparagus might be grown for forcing, either side by side, or in separate plots, the treatment of the one would be applicable to the other; and therefore one description will suit both. I only observe, that, if neither turf nor sea-weed can be obtained, good kale can be produced in any light garden soil, trenched in the manner before described for asparagus beds, and manured copiously with wood (not coal) ashes, and the prescribed quantity of common soil. All the difference in the two beds is this, that for *sea-kale*, or forced asparagus, the plot of ground should be large enough to permit the plants to stand in *single rows* three or four feet apart. The rows may be of any required length according to the quantity likely to be consumed. Supposing that six or eight rows, each twelve feet long, be required, then the ground is either to be trenched twenty inches deep at the least, or digged out and replaced with the enriched turf; and the work ought to be completed before March, so as to become settled by the middle or latter end of that month. Between every row there should two stakes be set up at each end, two feet asunder; these will mark the *beds* and the *spaces* between them; thus there may be eight beds and nine spaces or divisions. At the time of *sowing* the beds—(I greatly prefer seed to plants)—leave a space on the outside of two of the outermost stakes, and strain a garden line exactly along the middle of the bed immediately within and next to it; and beginning at one end of the line—but a foot within it—make a small ring or circle with the finger, an inch deep, and three inches wide; or what is better, force a circular piece of iron or wood into the ground to the required depth, and drop three seeds in the ring so formed, equidistant, and at right angles with one another. Form and sow the rings about fifteen inches asunder—centre from centre, the whole length of the line; then cover the seeds to the surface depth with sand, and pat it to a level with the flat of a spade; one row or *bed* will thus be sown. Leave the adjoining *space* of two feet vacant; and proceed to the bed or division next beyond it: sow that, and proceed in the same alternate

order till the plot be completed; when a space exterior of the last sown division must be left, and it will then be found that whatever be the number of divisions sown, that of the unsown spaces will exceed it by one. The plan thus laid down is grounded upon the practice of the celebrated Bath cultivators; and nothing can exceed it for the facility it affords to good tillage, and orderly, convenient forcing. It must be apparent to every one versed in horticulture, that *Asparagus* can thus be sown or planted, and be cultivated—for forcing—with every advantage afforded to sea-kale, as will be further shewn in the detail.

If the seed be good, the season propitious, warm, and moist, germination will rapidly advance; and when the plants appear, they may be secured from vermin by sprinkling around and within them a good covering of wood-ashes (three parts,) blended with soot and powdered lime, of each one part. If weeds arise and threaten to surmount the plants, they must be kept under by surface-hoeing to the depth of an inch, with the "Dutch," or thurst-hoe. Perhaps three plants will rise from each ring, and these, indeed, all that grow, must remain till they begin to interfere with each other; then, one only, the strongest, must be left, and the others drawn, or raised up; so that a complete row of single plants, from one foot to 15 inches apart, finally remain. The young supernumeraries may be set out in rows, to grow for succession, or be thrown away if no more stock be required. The plants in the rows will grow luxuriantly, and become very large, so much so as, in all probability, to come in contact, forming one connected line of sea-green foliage. All the culture during the summer and autumn, will consist in keeping the beds clear from weeds, and in digging alternate spaces two or three times, to the depth of nine inches, so as to pulverize and render the soil as fine as possible. At the two last operations (say in July and October,) it would be as well to incorporate with the soil a two-inch layer of decayed leaves, mixed with one-fourth part of pure wood-ashes.

The reader will be very careful to avoid sea-coal, or even pit coal ashes. It formerly was the custom to cover sea-kale with conical hills of those ashes during winter, and one out of three or four plants perished, the damage being ascribed to mice or moles. I never have lost a plant since I left off that acrimonious chemical compound, styled ashes, nor could I, by any means keep my bed entire, while I employed it. Its destructive influence has at length been admitted, and sea-kale now enjoys a regular growth, and repays its cultivator. No forcing ought to be attempted during the first winter; but it would not be amiss, after clearing off all the old leaves, to strain a line along the edges of the beds, and, cutting the earth by it three inches deep, to mould up the two feet beds with the earth taken to that depth from the intermediate spaces. A tall marking stick should, however, be placed near the centres of the plants. After the "earthing up" a blanching-pot, wooden box, or old bee-hive, is to be set over every plant. A straw-hive is indeed an excellent material. It is sufficiently strong, warm, and impervious to light, even when used alone, without leaves, for blanching. A small or even a very tolerable gathering of fine white kale will be the result of this treatment, earlier or later, according to the season and climate; and, in cutting it, the knife should be passed below the surface of the stratum of soil that was added, so as to bring up each full-sized shoot in a compact state, and not in detached leaves. The smaller sprouts ought not to be cut; and, when all the large ones have been taken, the superposed

soil should be drawn back into the spaces, and the whole plot reduced to an even surface-level. This work will, it is presumed, be performed about mid-April, and then a knife, or very sharp-edged spade, should be passed through the shoots, so as to cut off every one that rises above the original level of the bed. This cutting will induce the plants to send forth a number of fresh shoots, and prevent, in a degree, the protrusion of flower-stems. The routine culture of the second season will comprise weeding with a flat-hoe, digging and enriching of the spaces, as before directed, and the immediate excision of every flower-stem that may be sent up.

FORCING.—(These directions will apply equally to asparagus in single rows, by the second method.) After the leaves of the sea-kale, and stems of asparagus have become inactive, remove the former, and cut off the latter. Mark each sea-kale plant with a tall stick, dig and mould up the beds with fine earth from the spaces, as in the previous season; but now, and in each succeeding year, dig out, and remove to a spot at hand (as convenience may point out,) the earth of each space, on the sides of those rows which are to be excited, so as to leave trenches one foot deep. The plots ought to be so contrived as to furnish three distinct forcings, the first to commence late in November, to be cut at the close of the year; the second about the first week in January; and the third early in February. A fourth reserve ought to come in at the natural season, blanched but not forced in April. The trenches are to be filled to the level of the tops of the line of pots or covers with tree leaves, blended, if possible, with one-third part of fresh stable-manure. When this level is attained, the pots, and spaces between them, must be covered to the depth of two feet with the same materials; but for asparagus, which can have no pots, leaves alone are recommended to the depth of 18 inches. If shallow boxes or troughs, formed of three strips of boards fastened together, and five or six inches deep, could be inverted over the whole line of asparagus, the mixture of dung and leaves might be safely employed.

The bed of fomenting material, in either case, ought to form a compact mass of equal depth; and this it would be advisable to cover with straw, hurdles or thatch, to keep out excessive rains, and to retain the developed heat. Trial-sticks should be thrust deeply into the masses; and if these, on being withdrawn, feel gently warm, the work of forcing will proceed regularly; and kale and grass will be procured in succession from Christmas to the end of March; to be succeeded by the crops from the unexcited bed. After forcing, and clearing off the leaves, &c., the trenches are always to be filled up, and the surface-level restored. The slight difference to be observed in treating these two delicious vegetables, will soon be sufficiently obvious to every cultivator of discernment, and need not be alluded to at this time.

III. RHUBARB.—My notice of this exquisite vegetable shall be comprised in a few lines; but these I trust, will avail to extend its culture more and more; for any thing more productive, salubrious, profitable, and expressly suitable to the purposes of the cottager, can scarcely be found in the entire list of vegetable productions. A few years only have elapsed since the rhubarbic hybrid, green rhubarb, was cultivated for tarts, and held in very slight estimation; but since the introduction of the larger (giant) varieties, the demand has increased with surprising rapidity. Of the two sorts which I earnestly recommend, one is called, if I mistake not, *Ratford's Scarlet Goliath*; and the other is a small red variety, which is crimson throughout when boiled or baked. These will supply

the table from April to August, and suffice for every purpose.

**CULTURE.**—Let the ground be prepared precisely as for asparagus beds. Select clean offsets, with two or three bold eyes: the first week in March is a very suitable season. The eyes or buds of the Goliath will be of a deep, rich red, hence its name: the leaves, however, and stalks are green, though of different hues, and the latter are spotted and streaked with red. In the smaller pink variety the red tint prevails throughout.

The plants of the great Goliath should be set firmly in the soil, five feet apart, or five feet one way and four feet another; the smaller kind may be set three feet asunder, plant from plant, giving a free watering to each to settle the soil among the roots. Dry weather, an open condition of the ground, and a temperate, unfrosty state of the air, should be preferred. When the growth becomes established, the ground must be kept free from weeds; and if dry weather supervene, water ought to be freely given around the roots, two or three times, with intervals of four or five days.

Not a leaf or stalk ought to be touched during the first year; and in autumn, when the leaves are all decayed, they should be laid in little trenches formed along the centre of the spaces between the rows, sprinkled with a handful or two of salt, and covered with the earth that had been digged out. Thus the plant will itself furnish a portion of the manure that will annually be required. As winter approaches, a coating of well-decomposed stable manure or leaves, or a mixture of both, two or three inches deep, should be laid round each plant, to the extent of two feet; and in the open weather of February, the whole bed must be forked over.

As a proof of the excessive productiveness of the *Scarlet Goliath*, I need only mention, that, in the second week of March 1831, twelve plants were set in ground prepared for asparagus. In June the leaves met, and the whole plot was covered. In 1832 the plants yielded profusely, many leaves measured above a yard and a half over the surface, the footstalks being an inch and a half broad, and from two to three feet long. The outside leaves were, as required for use, stripped off by an oblique pull, not cut; the family was amply supplied till July and August, and yet the plants increased: the neighbours also were furnished with leaves throughout the Summer, and with *offset-plants* in the succeeding Spring. During the two past seasons the root-stocks increased to such a size, that, when it became needful to remove some, it required a barrow to contain the weighty mass that was raised, after great labour, from the soil. If any one try the experiment in favourable soil, and with any thing like judicious management, he will scarcely fail to discover that the growth and production of the plant will exceed every demand that can be justly made upon it.

**IV. ARTICHOKE** (*Cynara Scolymus*). *Syngenesia Polygamia Æqualis* (Cl. xix ord 1.), *Linnae*; tribe **CARDUACEÆ**; among the *Compositæ* or the compound flowers of the natural "*Jussieuan*" system is, as the tribal name implies, nearly related to the thistles; the observant natural physiologist must be aware of this from the imbricated order of flowering, and the dense close head which contains the blueish flowers, and the seeds surmounted by a feathery down (*pappus*.) In England the full heads only are eaten boiled; these heads consist of a fleshy receptacle, on which the flowers and their bristly appendages are based; and of an alternating series of scaly bracteas or floral leaves (*involucrum*.) that are fur-

nished with a pulpy substance at and above their point of union with the base.

**CULTURE.**—All that has been previously said as to the preparation of the ground for the asparagus, will apply to this valuable autumnal vegetable: it delights in a rich and light soil; therefore a sandy turf will supply the appropriate medium of growth. *It is propagated by suckers* or offsets taken from old plants, and planted in March and April, either in a bed of three rows, four or five feet asunder, the plants three feet from one another, or in single rows between other vegetables. The soil ought to be previously digged and laid even; and the line, being strained very tight, each sucker should be planted by the dibble or garden trowel, and fixed securely in the soil. Nothing tends so effectually to promote the growth of any sucker or offset as to place its base, and the lower parts or joints of its stem, firmly in recently removed ground. The vital principle thereby becomes stimulated, and, to speak chemically, is acted upon by the electro-gaseous products of the soil at the moment of their development. Water, if the weather and soil be dry at the time of planting, ought to be then freely given around the plants, and, subsequently, more than once, in order to fix them in the soil, and prevent stagnation of the vital fluids.

The subsequent culture consists in keeping the ground clean and moderately open; and, at the approach of frosty weather, to draw earth about the stems, as in landing up celery, but not bringing it to so acute a ridge at the top. Artichokes may be abundantly produced in the autumn of the first year; some plants will not, however, be prolific. The fruit ought always to be gathered, and the stems cut close off prior to the winter earthing-up. In the second season the plants will become abundantly more prolific, and great care should be taken to preserve them from extreme frost by straw, haulm, or evergreen boughs, laid upon the ridges of the soil so as to form a sort of roof over the herbage; but these coverings should be removed in rainy weather. The heads may be preserved throughout the winter and early spring months, by inserting the lower ends of the stems in sand, under shelter of an out-house or cool dry cellar.

The artichoke plant produces abundance of suckers, which ought to be detached in March—not in the torpid season, and of the best of these fresh plantations may be formed. We suggest, on the ground of the doctrine of *radical excretion*, that, if the plants stand in single rows widely apart, between which a rank of potatoes, beans, or peas, be grown,—the new suckers be planted on the site of such crops, in order to reap the benefit to be derived from the matters ejected into the soil by their excretory organs, and by the actual deposition of detached vegetable fibres.

Thus artichokes and annual crops may be made every two or three seasons, to alternate or "rotate" with each other.

**USES OF SLATE.**—Slate is coming daily more extensively into use; it is being employed for paving the area in front of the New National Gallery, and also for church-yard memorials, in place of stone. It appears from a paper read at a recent meeting of the members of the Architectural Society, that a slab of Welch slate, one inch in thickness, is equal in strength to a piece of Yorkshire stone of six inches, or of Caithness or Valentinia stone of two inches in thickness.—*London's Architectural Magazine.*

EMIGRATION.

SIR,—In the *Globe* of the 12th inst. I read a letter addressed by you to the Editor of that independent and respectable journal, wherein you unsparingly condemn him for opinions expressed a few days ago in an editorial article, with reference to certain measures recommended by the Irish Poor Law Commissioners, for bettering the condition of the wretched and long neglected peasantry of that country.

Before you so arrogantly claim to yourself such exclusive knowledge as to the preceding subject, and unhesitatingly pledge your veracity and challenge contradiction for your assertions, you should have taken the trouble to have obtained *correct* information as to the *important* item of expense, claiming as you do, on the score of economy, great superiority in favour of bog draining, and squatting the wretched peasantry on a patch of *floating bog* or waste land, as if afraid to allow them to taste the sweets of improvement by their being put on the sure path to independence by means of a judicious system of emigration. You state that the sum necessary to remove a pauper labouring emigrant from Ireland to Canada will cost *twenty pounds* sterling.

Now, Sir, I will tell you that your statement is more than *four times* greater than the fact; and it is evident you have been made the dupe of asserting as great a miscalculation as ever was put on paper.

I cannot for a moment think you would deliberately state that which you know to be untrue, therefore my chief object in thus noticing your letter is to caution you from such hasty conclusions in future, and not to suppose that any measure can be made palatable to the public, and to obtain the countenance of men of reflection and judgment, by such unfounded statements.

I beg to tell you, Sir, that a labouring pauper adult emigrant can be removed in a satisfactory manner from a port in Ireland to a situation in upper Upper Canada, where full employment can be obtained immediately on his arrival, for the sum, considerably *under 5l.* I will, however, adopt that sum; the items of disbursement as follows:—

Passage from a port in Ireland to Quebec, including berthing, fuel, water, and medical aid.....	£2	0	0
Ample provisions 60 or 70 days, consisting of potatoes, oatmeal, butter, fish, bacon, molasses, tea, and sugar.....	1	15	0
Capitation tax at Quebec (Currency of Canada) .....	0	5	0
Steam-boat transport from Quebec to Toronto, or any landing at the head of Lake Ontario, in Upper Canada .....	0	17	6
	£4	17	6

Thus, sir, for less than *5l.* sterling for each adult, I will guarantee to remove one thousand able bodied labourers from a port of embarkation in Ireland, and place them in a situation to insure them full employment, and, if sober and industrious, certain prospects of independence, raising them from a state of moral degradation and wretchedness to a place among civilization and comforts. Can you do equal good for the poor labourer by expending *5l.* in providing him with employment at home? and will his prospects be equally favourable at the termination of such outlay? If you wish for further positive facts in reference to the preceding subject, I shall be very glad to favour you with them, but not through the medium of a newspaper correspondence.

I, remain, sir, yours, &c.  
HIBERNICUS.

April 15.

EAST LOTHIAN AGRICULTURAL SOCIETY'S SHOW AT HADDINGTON.

HADDINGTON. — The show of Cattle, Bulls, Horses, &c. for the premiums offered by the East Lothian Agricultural Society, came off here on Friday April 1, and was in the opinion of all who attended, by far the best and most interesting that we have ever had. The stock shown was all of a very superior description, and the judges experienced much difficulty in awarding the premiums, owing to the excellence of all. They were adjudged as follows:—

1. For the pair of fattest cattle of the Aberdeen, Angus, Fife, or West Highland breed, to Mr. James Bogue, Snadon.
2. For the second best ditto, to Mr. Ferguson of Raith, M. P.
3. For the pair of best cattle, bred in the county, to Mr. Robert Walker, Whitelaw.
4. For the pair of second best ditto, to Mr. George Reid, Ballencrieff.
5. For the five best black-faced Wadders, to Mr. George Reid.
6. For the five best half-bred Leicester Hogs, to Mr. Brodie, Amisfieldmains.
7. For the best short horned Bull, to Mr. Brown, Halls.
8. For the second best ditto, to Mr. Mylne, Bolton.
9. For the third best ditto, to Mr. Walker, Whitelaw.
10. For the best yearling Bull, to Mr. Brown, Halls.
11. For the best cart Stallion, to Mr. Meikle, Bathgate, for his horse "Farmer's Favourite."
12. For the best year-old colt, to Mr. Tweedie, Coats.

The judges of the fat cattle and sheep were Messrs M'Gill, Moffat, and Hutchinson; of the Marquis of Tweeddale; and of the horse Mr. Walter Cosnar.

Besides the cattle shown for the four first premiums, a lot of 28 was exhibited by Mr. Brodie, East Fortune, and another of 20, by Mr. Howden, Lawhead. An account was given in this paper on the 23d March, of the manner in which these cattle were severally lotted out and fed, and much interest was excited by the exhibition. A printed report of the manner and expence of feeding was circulated on the show ground, and being put into separate pens, each lot marked and numbered, the result of both experiments could be examined and appreciated by all. The following table shows the original cost of the cattle, the quantity of food consumed, and the valuation put upon them by the judges.

MR. BRODIE'S.

- Lot 1. Fed on turnips alone, cost 12l 15s, feeding for 22 weeks, 5l 3s valued by judges, 21l 10s.—Profit, 3l 12s.
  - Lot 2. Fed on turnips and potatoes, cost 12l 15s, feeding for 22 weeks, 6l 9s 9d, valued by the judges, 22l 10s.—Profit, 3l 5s 3d.
  - Lot 3. Fed on turnips and linseed cake, cost 12l 15s, feeding for 22 weeks, 7l 7s 9d, valued by the judges, 25l.—Profit, 4l 17s 3d.
  - Lot 4. Fed on distillery grains, &c., cost 12l 15s, feeding for 22 weeks, 5l 12s 9d, valued by the judges, 21l.—Profit, 2l 12s 3d.
- We understand that all this lot has been sold at 24l each.

MR. HOWDEN'S

- Lot 1. Cost 7l, consumed in 22 weeks about 49½ tons of Swedish turnips, and are valued by the judges, at 12l 4s each.
  - Lot 2. Cost 7l, consumed about 24 tons of turnips, and 16 tons of potatoes, valued at 13l 12s each.
  - Lot 3. Cost 7l, consumed 24 tons of turnips, and 1¼ tons of beans, valued at 14l 16s.
  - Lot 4. Cost 7l, consumed 16 tons of potatoes, and 1¼ tons of beans, valued at 14l each.
- It is understood this lot is sold at 14l each.

The above experiments show that the most expensive feeding yields the greatest profit. The fleshers to whom the cattle have been sold, are to report the value of the several lots after they are slaughtered, which will carry

out the experiment to the utmost, and show to feeders generally, what sorts of food are most profitable, both to themselves and to the butcher. A premium of 20*l* was awarded to both gentlemen, the reports of the manner in the experiments were respectively conducted have been considered highly satisfactory.

## THE TRADE OF GREAT BRITAIN.

(FROM THE BANKER'S CIRCULAR.)

SIRs,—The following statement exhibits the extraordinary increase which took place in the exports of British manufactures in the year 1835, compared with the year 1834. It will be seen that, in every one of the fifteen articles, the amount—taking in real, not official value—is greater, (tin alone excepted); the export of this commodity in both years is nearly the same. We place the fabrics of the loom at the head on account of their importance, and the excess in the amount exported being in these the most striking and extraordinary.

	1834	1835.
Cotton Yarn .....	£5,211,015	£5,709,041
Cottons .....	15,302,571	16,394,590
Linens .....	2,579,658	3,226,394
Woollens .....	5,975,415	7,046,829
Silks .....	637,198	972,031
	£29,705,857	£33,348,888
Hardware and Cutlery..	1,485,233	1,835,142
Iron and Steel .....	1,408,872	1,680,750
Copper and Brass .....	961,823	1,081,554
Lead and Shot .....	142,513	197,474
Tin .....	33,327	33,238
Tin Plates and Wire....	324,559	368,429
	£4,354,237	£5,196,587
Coals .....	220,746	242,369
Glass .....	496,872	640,867
Earthenware .....	493,382	538,426
Wool .....	192,176	387,416
	£1,403,176	£1,809,078
Total of the three classes	£35,463,360	£40,354,553

Most persons of inquiry and research have regarded with extraordinary interest the great activity and long continued prosperity of our manufactures, viewed merely as a statistical question; for whatever the ultimate result of the increased production may be, whether the exporters of our goods may finally realize, in substantial value, those anticipations of profit which have been one of the main causes of the increased production, or whether some of the markets may be overstocked, and the returns tardy and scanty, it is quite clear, we think, that prosperity to the mere manufacturer has been secured by the state of trade prevalent for more than two years past. To analyze the sources of this prosperity, to describe its character, and to be able to form a correct judgment concerning its probable duration, would be at once useful and interesting. The materials for such an undertaking could not, however, be very readily obtained, because no man can have access to the circumstances of every individual merchant; and yet without knowing what proportion of a brisk trade is to be ascribed to the effect of credit—renewed, enlarged, or prolonged credit—and what proportion to a real scarcity of goods in the markets of consumption, it would be impossible to take

a full and correct view of this matter. The general circumstances bearing upon it we may at least endeavour to render serviceable.

The most remarkable feature of the present state of manufactures and trade, is the great activity prevailing, not in two or three, only, but in all departments of manufacturing industry. The increase of the Cotton trade does not show itself more conspicuously at Manchester, than that of the Linen trade does at Dundee—regard being had to the previous state of the development of the two branches of trade respectively, and attention being given also to the relative facility or difficulty in obtaining the raw material for supplying them. Every branch of the Woollen trade has been marked by the same difficulty in obtaining the raw material in sufficient abundance to meet the increasing orders for goods, and the demand has been almost equally strong for the finest broad cloths of Trowbridge, Stroud, Leeds, and Huddersfield, and for the coarsest druggets, blankets, and carpets, of Witney, Kidderminster, Dewsbury, and Kilmarnock. The trades of Sheffield and Birmingham, though the basis of both is metallic, differ as much as the trade in Norwich crapes and bombazeen differs from the broad cloth and carpet trades; yet Sheffield has corresponded with Birmingham in activity to as great an extent as one town can do with another, the inhabitants of which are more enterprising and speculative. Nor is the same general feature to be seen alone in these great divisions of the manufacturing interest; it is equally discernible in the minor departments; the Hosiers of the midland counties, the Potters of Staffordshire, the Glovers of Worcester and Yeovil, and the Shoe manufacturers of Stafford and Northampton, all testify to an improvement and an advance in their condition.

It may not be possible very distinctly to indicate one general cause for this universal and almost uniform effect, but still we think that cause will be found to exist, substantially, in the great and prolonged contraction of confidence at one period, and its great and long continued extension at another. It is easy to say that the effects of the panic of 1825 have not yet subsided; a true history of the causes, the extent, and operation, and of the consequences of that convulsion, would be one of the most valuable offerings to the men of business and the politicians of the age—to the manufacturer and merchant as well as to the statesman. We some time since called attention to the fact of five British companies having lost four millions sterling in attempting to carry on mining operations in foreign countries. This was a startling case; it was, however, nothing more than a type, and a very imperfect and insignificant one, of the wide spread ruin which the familiar term "the panic of 1825" ought to indicate. The measures to which the Ministers of 1822 resorted for the purpose, to use their own language, of reviving a spirit of speculation, had the effect of raising the prices towards the close of the following year, and this temporary prosperity was carried to excess in 1824 and 1825. The effect, however, was at once annihilated when it placed the Bank of England in jeopardy, a result which—if the Government had had the requisite knowledge concerning the operation of the great causes of speculation and activity, produced by the means of excitement then in their contemplation—ought to have been foreseen and considered by them, before they adventured upon so hazardous an experiment for the relief of distress.—One of the consequences of the

relaxation, effected by the measures of 1822, was to put off for a few years the disasters which subsequently befel the great merchant-bankers of Calcutta, and the merchants of our long settled colonies in the West Indies. If the policy which dictated the relaxation had been adopted in 1821-5, as the rule of conduct for the Government, those great interests in the West and in the East Indies might have been saved altogether.

These circumstances are exceedingly important to be borne in mind when we are attempting to ascertain the precise character of the present state of commercial prosperity and its probable consequences. The panic ruined old, and formerly opulent, firms in England, in great number, but if that had been the whole mischief, energies of enterprise and industry would much sooner have recovered their elasticity and force. Instead of a general revival taking place in commercial and manufacturing operations in 1833 or 1834, it would probably have commenced in 1828 or 1829. Confidence, wherever credit was necessary to put industry into motion, was completely paralyzed by the convulsion of 1825, and it was prevented from recovering by the large failures among merchants, who had, directly and indirectly, contributed much to furnish the manufacturers with orders for their goods. These failures continued to occur for seven years subsequently to the panic, and tended much to keep manufacturing affairs in a depressed and unnatural condition. The period when this great and signal check to the development of industry and the extension of commerce took place, was the precise period when all the means of production would, in a natural and sound state of things, have been in full vigour and complete efficiency. After a war of more than twenty years duration, during which England alone had maintained her commercial greatness, several years would necessarily elapse before the capital of her bankers, merchants, miners, and manufacturers, could become properly adjusted to the new state of things under a peace, and ten years after its final termination would be the time when the utmost vigour might be expected to prevail. The panic therefore produced more effect on the pursuits of industry than could be effected by a declaration of war; and was nearly equal, in its destructive and depressive agency, as far as the interests dependent on the industrious are concerned, to a decree compelling every borrower of money to pay thirty shillings for the pound to his creditors.

The panic was not, therefore, an ordinary commercial convulsion, like those of 1793, 1797, 1810, and 1816, the ruinous effects of which soon passed away, and were, in a national sense, speedily compensated by the enterprise and activity which succeeded them, but the immediate mischief was of unparalleled magnitude, and its repressive effect upon industry and commerce was of the most protracted and extraordinary character. And it is curious to observe how this view of the subject has been illustrated and confirmed by the operations of the banking system. The old bankers would naturally be more strictly circumspect and cautious after the destruction of credit which took place towards the close of the year 1825. But the Act permitting the formation of Joint-stock Banks in England and Wales passed in the early part of the year 1826. How can we account for this law, so urgently required, as it had been represented by the Ministers to be—remaining almost a dead letter for five years after it had received the Royal Assent? How came it that the public, generally

so much alive to their own interest, could not discover its urgent necessity for so long a period? Undoubtedly part of the answer is, that the people were in general satisfied with the existing banks. But Lancashire—now adding to its wealth and population every year, in amount equal to the entire wealth and population of several of the smaller counties—how came this important district to be backward in perceiving the advantages of the new system? We believe there was no Joint-Stock Bank formed in Manchester or Liverpool for nearly five years subsequently to the panic; and that last pregnant and important word accounts for the whole mystery. The elastic spirit and natural resolution of the people continued so much depressed by the accounts of the failure or difficulties of eminent firms connected with distant markets for supplying the consumers of our manufactures, that there was no disposition to enter upon new projects. Every man's attention was directed to the prevention of further dilapidation upon his own possessions and circumstances.

This state of general depression was far from being limited to England and her colonies. It extended to all the foreign markets. Less to those of the United States of America than any other because their banking and credit system contributed to keep their great internal resources free and fruitful. But with this qualified exception, the state of commerce was languid and inanimate for seven years succeeding the panic; and some of the most extensive failures connected with the East and West India interest, occurred in the latter part of that term. The bankruptcy of the eminent firm of Manning and Anderton took place in 1831, and some time after, the unexpected failures to a great amount in Petersburg, Prussia, and Hamburg. These facts show the insidious, but powerful operation of the one great cause of disaster which continued to produce its inevitable consequences for so long a period.

Then another cause contributed greatly, in the years 1829, 1830, and 1831, to produce a similar result; we allude to the political discontents, agitations, and alarms which burst forth into open insurrection in France, Belgium, and some of the minor states of Germany. The destruction of confidence in France was so great at one period that, united with the very general disposition to hoard coin, there was great danger of all the operations of industry in the great towns being entirely stopped. It was the effort which Lafitte made to prevent such a catastrophe, by lending his money freely to the manufacturers and traders of Paris, and other populous cities, that caused his banking-house to suspend payment. We say "suspend," because we are to understand that that liberal-minded individual has discharged all his obligations, or is prepared to do so, and is proceeding to commence business as a banker with a fortune which is still large, recovered from the wreck of his former wealth. Commercial men describe the state of trade in France for more than two years subsequent to the revolution of 1830 as approaching to an interdiction of all the ordinary interchanges in business. And France never wholly recovered from this plight till within the last two years.

This brief reference to a long antecedent state of depression appeared to us necessary to an accurate examination of our present condition. The long protraction of the pressure was one of the causes of the great rebound which followed the removal of that pressure. And it is a matter of

serious import—of the first necessity—that the difficulties which encumbered mercantile pursuits from the year 1819 to 1833 should be clearly seen, understood, and admitted, or the nature of the present state of activity and comparative prosperity will never be correctly apprehended. There has been a somewhat similar action simultaneously proceeding in most great commercial countries, which has led to somewhat similar results in all. It is necessary to bear this circumstance in remembrance when we would understand the nature of the present prosperity, and be able to estimate the kind of convulsion that would be likely to take place, if any serious check to confidence should arise. The part of the subject which is of more immediate importance is that part which would commence where we now leave off, viz. an examination of the working of the machinery which has been instrumental in propelling enterprising men forward in a career of adventure and exertion, when the general pressure, to which we have here alluded, began to be abated and at last partially removed.

We are well aware that the nature of our present prosperity is an obstinately litigated question amongst men prone to enquiries concerning the operation of the causes of wealth. While some of the ablest men in the country say that the alleged prosperity is hollow, and that it will never bear the test of the ultimate winding-up and settlement, which has not yet arrived; another party, and this of course comprises the governing body, assert that prosperity was never based on a firmer or more stable foundation, and that, so far from there being any grounds for apprehending mischief, we are only just entering upon a course of unexampled activity and profit. The first contend that a convulsion, pregnant with wide-spread ruin, may be expected to happen speedily, while the latter think that scarcely any probable cause can spring up to interrupt our present tranquil and satisfactory state. We shall endeavour, in the next Circular, to indicate the grounds from which something like a correct judgment may be formed on this contested question.

#### FOR THE SHREWSBURY CHRONICLE.

MR. EDITOR,—Can you inform us what the Agricultural Society of this county are doing? or what is the purpose of their meeting just now. Was the prospect of the farmer ever much brighter than it is at this moment? certainly not within these last five and twenty years.

Will the members of this society petition his Majesty and say—“We your Majesty’s loyal and dutiful Conservative subjects, do hate and abhor every act and deed done by any Minister of the Crown, so long as that Minister is supported by that infernal Irishman, Daniel O’Connell?”—Better they should recommend to all landlords, whose tenantry are in arrears of rent, to profit by the good example of that Prince of them, Sir Watkin W. Wynn, Bart., who by one short order to his principal Agent and Auditor, diffused more happiness and more industry in his country than had been done for years, and which was done in these words:—“Wipe off all the arrears of my tenants.”

Let other landlords do alike: let them give their tenants a fair start again:—and I warrant they will do. “Rub out old scores and begin again,” says the beaten man.

Confidence is all that is wanting between landlord and tenant. The former can establish it if he likes.

I am, Sir,  
Your obedient Servant,  
A SHROPSHIRE FARMER.

#### CONSIDERATIONS TO BE LAID BEFORE THE COMMITTEE ON AGRICULTURAL DISTRESS.

That the amount of profits derived from agriculture are regulated by the price of produce, as compared with the expenses of cultivation—

That is, they consist of the surplus that remains after all the expenses attendant on cultivation have been paid.

That of late years, though the price of produce has fallen greatly, yet that the expenses attendant on cultivation have not fallen in the same proportion; consequently the amount of profit is very much reduced.

That the amount of rent which the cultivator of land is able to pay to the owners for the use of the land, depends on the amount of profit that he can obtain in cultivation.

Therefore, that in the same proportion in which the profits are reduced, so the real power to pay rent is reduced. Consequently, the rent of land can be permanently secured only by means which shall preserve a certain profit in cultivation. Therefore, that as far as the expenses of cultivation on the prices of produce are dependent on legislative enactments, so likewise are the profits of agriculture dependent on the same enactments. Consequently, the amount of rent which the cultivator is able to pay for the use of the land is also dependent to the same extent on these enactments.

That as far as legislation can effect the object, the owners of land have a just claim to such an adjustment or balance of prices and expenses as shall permit the obtaining such profits in agriculture as will secure to the cultivators the power to pay to the owners that proportion of the produce in the shape of rent which has been deemed fair for a long series of years.

That for a long period it has been deemed just to the owners of land (taking into consideration the price which produce bore) not to lay any burdens on the cultivators of land which should prevent their being able (on land of average quality) to pay about one-fourth of the produce to the owners of the land in the shape of rent.

And that all the public and private transactions of the country have been based on the allowed principle, that this amount was the just property of the owners of land.

That the prices of agricultural produce have now fallen to such an extent, that (taking into consideration the necessary expenses attendant on cultivation), the profits of agriculture are so reduced, that on land of average quality, the produce returns very little, if any thing, more than is required to cover the necessary expenses; so that the real rent of average lands, even if it has not been annihilated, is, at all events, reduced far below that point, which for many years been considered fair.

That the cultivators of land (from the difficulty of obtaining other employment—from ignorance of other kinds of business—from delusive expectations, and from competition produced by these previous causes) have long been, and are now paying far more in the shape of rent, than the profits of agriculture enable them to do, and are therefore becoming poorer every day—not only by the loss of their own profits, but also by the diminution of their capital. But that it cannot be expected that the cultivators of land will continue to do this many years longer.

Therefore, under present prices and expenses, the owners of land of average quality will be obliged ultimately either to submit to an extreme reduction

of rent, if not to its total annihilation. Or else, displacing the present race of cultivators, they must themselves become cultivators, and be content with the mere profits of cultivation, having lost all those profits of ownership which have hitherto been considered their just property.

But if the present race of cultivators are to be preserved from ruin, and if the property called rent is not to be annihilated, the expenses of cultivation and the prices of produce must be adjusted afresh, so as to restore such a profit in cultivation as shall enable the cultivators again to pay the fair proportion of the produce to the owners.

The cultivators of land have already reduced those expenses over which they possess any control to the lowest point possible; but they have no power to reduce that part of the expenses which is dependent on the direct or indirect taxes and burdens; and as the cultivators practically have no power over prices, they are unable to relieve themselves from their present ruinous position. That the expenses attendant on cultivation are dependent to such an extent on the effect of direct and indirect taxes and burdens. That if these were removed or reduced, the necessary amount of profits might be restored. But if these taxes and burdens when so removed are still to be paid, they must necessarily fall on some other class of the community instead of falling on the cultivators of land.

If they fall directly on the property of the kingdom, as the landowners would then be receiving their fair amount of rent, they would also pay their fair proportion of these burdens. But if it be determined that the taxes, &c. now falling directly or indirectly on the cultivators of the land, are so interwoven with the whole system of taxation and the whole external and internal arrangements of the country, that they cannot be advantageously removed or reduced to the necessary point; and that if they were laid directly on property it would be injurious to the general interest of the country, by driving out capital and bullion, &c.—if this be the case, these burdens must be considered as immovable, and other means of relief must be adopted.

If, then, it be just and necessary, that the property of fair rent should still be preserved to the owners of land, since *the expenses cannot be reduced*. The prices of produce must, if possible, be so raised as to restore the necessary profits under present expenses. For if it be just that the value of the property of landowners should not be annihilated by taxes, &c., then is it also just, between one part of the nation—viz., *the consumers of produce*, and another part—viz., *the owners of land*, that the consumers shall pay such a price for the produce as will secure the required profits in cultivation. This increased price will be charged from one grade of the productive classes to another, on their labour or manufactures, until the additional price will be paid at last, by those who are consumers merely, and not producers, and who, having nothing to sell, cannot reimburse themselves.

That prices would be raised in three ways:—

1. By diminishing the quantity of produce in the market.
2. By increasing the actual demand for the present quantity.
3. The quantity of produce and the demands remaining the same, by increasing the quantity of money in circulation.

The first of these could only be effected in a long process of time, during the whole of which time severe injustice would be inflicted on all the interests of the country, by a gradual diminution in the supply of food; while at the same time the greatest pos-

sible injustice would be done to the owners of land below an average quality, as well as to the occupiers and labourers, for this must be gradually driven out of cultivation.

The second means of raising prices is evidently impracticable.

Therefore the third alone remains—viz., to increase the quantity of money in circulation.

The quantity of money in circulation—that is, the quantity of pounds, as at present regulated by the quantity of ounces of gold which can be retained in this kingdom, every pound being payable on demand, in about one-fourth of an ounce of gold.

But if every pound were made payable by a smaller quantity, say, for example, the one-eighth part of an ounce of gold, then, the quantity of gold in the country remaining the same, and the regulating system the same, there might be double the number of pounds in circulation, since the quantity of pieces of gold into which each pound is convertible would have been doubled; consequently prices might, by an operation of this kind, be raised to that point, which is admitted to be a just one as regards the owners of land and the consumers of food.

If the foregoing statements are true, and the reasoning correct, it ought no longer to be asserted that the owners of land have no just claim to higher rents than the present prices will fairly afford them, and that it is not the fault of legislation that the property of the owners of land has become worthless. Their rents are, or must be, reduced or annihilated, because prices have fallen, while taxes, &c., have not been reduced in the same proportion. It is not the fall of price merely, but the fall of price acting simultaneously with the taxes, &c. At the time landowners consented to bear these taxes, &c., the price of produce was still high enough to preserve the necessary profits to agriculture.

Therefore unless prices have been lowered by such an increased production of food as renders the reduced price as profitable in the aggregate as the larger price, it is clear that the continuance of the taxes, &c., which destroy the rent, is as much a Legislative Act, though a negative one, as if those taxes were now first imposed; therefore that the destruction of their property is perpetuated by a negative act of the Legislature.

But this fall of prices has not been produced by any natural causes; merely as far as at least as England is concerned, there has been no increased quantity of produce raised during the last five years which can account for the fall of prices, or compensate for it.

But there has been another direct cause in operation which has reduced prices. The proportion which (for many years) the quantity of money had borne to the quantity of produce has been altered by an arbitrary law—and the quantity of money which can circulate has also been limited by the same law; so that increased production cannot, with any success, struggle against the effects of low prices, for, the quantity of money being in reality limited by law, any increased quantity of produce only tends still further to alter the proportion of the produce to the money, and thus to lower the price of such portion of produce.

This diminution in the quantity of money has been one great if not the entire cause of the fall of prices—of the consequent annihilation of real rent—and of the ruin of the tenantry.

This diminution has been effected by an Act of the Legislature; the increase may therefore be also effected by the same power.

The quantity of money has been so limited as to

give insufficient prices. It may now be so extended as to give sufficient prices.

The quantity of money is dependent on that law which fixes or alters the standard.

If the Legislature cannot, or will not, take off the taxes and burdens, &c., so as to leave the fair rent to the owners, it clearly can raise the prices so as to produce the fair rent, notwithstanding the taxes, &c.

If Parliament refuse to do either, their refusal, though a negative act, gives as direct an assent to the violation of property as if they now passed an Act professedly to confiscate the income of landowners. But such an Act would not produce half the ruin and injustice which their refusal to act must in this case effect. For though landowners will ultimately be thus robbed, yet before this robbery can be effected, race after race of cultivators will have sunk into inevitable ruin, till at last that wall of cultivators which defends the owners having been destroyed, ruin will break in on them and overwhelm them.

A FRIEND TO JUSTICE.

## AGRICULTURAL DISTRESS.

TO THE MARQUIS OF CHANDOS.

MY LORD,—I have been watching with much interest the proceedings before the committee appointed to inquire into the causes of agricultural distress. Various witnesses have been examined and opinions given upon many subjects connected with this most interesting inquiry; but, strange, although it may seem, the members of the committee altogether abstain from taking evidence regarding the influence which "high rents" have in promoting this distress; and also whether the greater part of the agricultural distress in England does not exist among the "tenants-at-will," who, from their peculiar and dependent situation, are totally precluded from ever benefitting either themselves, the land they cultivate, (I should not say "cultivate," as it is impossible that a "tenant-at-will" either can or will cultivate land as it ought to be,) or their landlords, excepting, of course, those proprietors who prefer a compulsory and unwilling vote at a county election to a well-managed farm, and a fair rent punctually paid by an honest and independent tenant.

"High rents" and "holdings-at-will" will be found to be the bane of agricultural prosperity; while in rents adequate to the times, and in leases which bestow upon the tenant independence from political tyranny, and induce him to embark his capital in the improvement of his farm, with a fair prospect of ultimately remunerating himself, will be found the antidote.

Your lordship takes so great an interest in agricultural distress, and is so anxious that the suffering condition of the tenantry of these kingdoms should be ameliorated, that I would fain hope that your lordship will not (as I fear has been already the case) permit a single witness to pass before the committee until he has been particularly questioned upon the two subjects to which I have taken the liberty of drawing your lordship's attention.

At the same time I would, with your lordship's permission, further beg leave to suggest, that as I suppose this committee has not been appointed solely for the purpose of ascertaining the causes of agricultural distress in England, but generally throughout Great Britain, a few intelligent Scotch farmers ought also to be examined before the committee.

From agricultural distress prevailing in Scotland to a great extent, where none of the speculative begging-of-state methods of administering relief contemplated by your lordship and other disinterested proprietors would avail, if unwittingly essayed by Parliament, perhaps not a few facts bearing upon the question of the "distress in England" would by an examination of Scotch farmers, be brought before the committee, and which would materially promote the success of the object which they have in view—namely, an inquiry into the origin of the present agricultural distress which exists throughout Great Britain.

I have the honour to be, my Lord, your Lordship's most obedient humble servant,

A TILLER OF THE SOIL.

*Long's Hotel, April 15, 1836.*

## RELIEF OF AGRICULTURAL DISTRESS.

The following Speech, made at a recent Meeting of a Scotch Agricultural Meeting, merits especial attention:—

MR. MAITLAND MARGILL proposed to drink "prosperity to the commercial and agricultural improvement of the country." All calm and judicious enquirers were now convinced that relief to agriculture, was to be best and most surely found in a liberal policy of mutual concession between landlord and tenant, leading to the improvement of the economy of agriculture, and in the increasing prosperity of commerce and manufactures. (*Cheers.*) While he was far from denying that a partial relief might be obtained from legislative measures, such as the lessening of the general burdens of the country, and the removal of oppressive local rates and taxes, still in his opinion the main channels of abiding prosperity, could only be looked for in those streams arising from the sources he had indicated. It was perhaps, however, not sufficiently known by the public how much in the way of concession had already been done. A great deal certainly had been done; but yet he was afraid much remained to do. It was unfortunate for the landlord, that with the declension of price in the various articles of agricultural produce, and therefore of his rents, he was placed in many cases in a position of peculiar embarrassment, inasmuch as the burdens upon his estate became relatively greater, so that he found himself fettered and tied down in such a manner as hardly enabled him—nay he would say absolutely precluded him—consistently with his family arrangements, from doing so much as he ought and would otherwise be inclined to do in that respect. Did he require to enlarge, however, upon the advantages to be derived from this mutual concession and co-operation between landlord and tenant, in the improvement of the economy of agriculture, he would only point back to what had been already accomplished—to what within the last few years had been achieved. (*Cheers.*) The magnificent results in this way—results, he was happy to say, which were still in the act of being realized—going to the augmentation of the value of agricultural property, had, however, in his opinion, on the other hand tended to impress upon the minds of a certain class of political economists a fallacious opinion in respect of the actual condition of agriculture. These had been taken to indicate a posi-

tive state of agricultural prosperity. Now he would venture to say, that they had their spring from the very pressure of distress under which agriculture laboured. The landlord had seen that unless he made very great exertions in the improvement of his estates, that absolute ruin awaited him. In this case, as in others, necessity had become the mother of invention. No doubt, it became them thankfully to look up and to praise an all-wise Providence, which had so arranged events that good was brought out of seeming evil in many instances, and so it had been in that case. But although relief in this way had so far been afforded them, still he thought it was rather too much that they should be told that this state of things—this state of increased agricultural exertion—constituted an evidence and a standing proof that agricultural distress was a mere cry got up to serve political purposes, and not based on actual fact. (*Cheers.*) Then as to the last mode of relieving agriculture which he had indicated, viz. the increase of our commercial and manufacturing prosperity, he would ask, who could doubt of its efficiency when they considered that it was mainly the market thus afforded for their produce on which they had to depend? Let them revert to the history of this very winter. Let them consider the great depression in the market at the close of the year, and the advances which it had subsequently made—advances which, although perhaps partially connected with other causes, still he had no doubt were mainly owing to that improved state of commerce and manufactures which enabled the labourers to augment their enjoyments, and to become more extensive agricultural consumers. He was not at the same time blind to the fact that the opportune rise in the market he adverted to was in some degree owing to the failure last year of the turnip crop in England, which forced the farmers of the south, in many instances, to feed their cattle upon grain, and which, through the improvements of steam navigation, had tended to raise that great demand for fat cattle in the Scotch market of which they were now so much reaping the advantage. He trusted he had said sufficient, however, to show, that whatever attempts may be made for the relief of agriculture, the two sources he had pointed out were the only ones from which efficient good or permanent prosperity could arise. It was alone through the mutual co-operation of landlord and tenant in the improvement of the soil, and the advancement generally of the art of husbandry, and the progressive advancement of our commerce and manufactures affording a corresponding demand for an increase of agricultural produce, that not only agriculturists, but all classes of the community, were to be placed in a sound and healthy condition of prosperity. He gave, therefore, "Prosperity to the commercial and agricultural improvements of the country." (*Drunk with thunders of applause.*)

#### OPENING OF ISLINGTON MARKET.

On Monday, two large marquees were erected within the principal entrance, in which a large party of buyers and sellers partook of breakfast with the proprietor. At four o'clock the market was opened by the purchase of three beasts; at which time there were about 450 oxen, 2,500 sheep and lambs, 80 pigs and 5 calves. As the morning advanced parties began to flock to the new Market, and at six o'clock it presented a most animated appearance. In the course of the day thousands of

persons visited it, most of whom appeared to have had no idea of the extent of accommodation provided. In the afternoon, Mr. Perkins, the proprietor, gave a public dinner to celebrate the event. Amongst the gentlemen who sat down to breakfast in one of the spacious marquees prepared for the occasion, were Messrs. Joseph Marriage, Jun, John Marriage, Jun, M. Mason, T. W. Crooks, W. Allaker, W. Sheppard, W. Steele, W. Simmons, J. Green, James Wood, W. Plum, S. Ratcliff, W. Cooper.—Henry Handley, Esq, the member for Lincolnshire, to whom the graziers and public are mainly indebted for the Act, by his exertions during the two last Sessions of Parliament, presided at the dinner, and among the numerous gentlemen present we observed—Sir W. Folkes, Bart, M. P.; J. E. Tennant, Esq, M. P.; F. French, Esq, M. P.; Hon. Capt. Edwardes; G. W. Coates, Esq, of Belfast; John Kene, Esq, ditto; K. Collett, Esq; H. P. Collett, Esq; George Dacre, Esq; P. Laurie, Esq.—Lawrence, Esq; Joseph Marriage, jun, Esq; K. B. Mosse, Esq; and many others, amounting to upwards of 300 persons. The following were among the toasts—Mr. Perkins, and Prosperity to the Islington Cattle Market.—H. P. Collet, Esq, as his solicitor, returned thanks.—Mr. Fitzstephen French, in a very elegant speech proposed the health of the Chairman, remarking how much the cause of humanity, and the interests of the graziers, butchers, and consumers were benefited by his able, indefatigable, and persevering exertions.—The Chairman acknowledged the compliment in a speech of great length, and remarked upon the evidence given by certain individuals before the committees, commenting on the contradictions in the statements of these witnesses, when compared with their memorials to the government some years back, and the difference between their evidence in the Commons and in the Lords, of the last session. He then proposed the health of Sir W. Folkes, and the other members of the Committee, who attended him *de die in diem* for so many weeks in the dog days of last summer.—Sir William returned thanks, assuring the company he should continue his support to the admirable arrangements of the New Market.—The Chairman then proposed the health of the Most Noble the Marquis of Salisbury.—He then proposed the health of Emmerson Tennent, Esq, and the other Members for Ireland, who had so zealously supported him and the measure in the Committee and House of Commons.—Mr. Tennent returned thanks in a most fluent and able speech, assuring the company that his best exertions would at all times be given to the prosperity and union of the two Kingdoms.—The healths of the Graziers who had signed the declarations, were then drank, and Sir W. Folkes returned thanks, stating that though grazing a small extent of land, he would continue at all times to give his best support to this market.—Mr. Handley proposed the health of Mr. Collett, as the solicitor for the Act, and remarked that his exertions and perseverance were very far beyond those usually given by a solicitor, for his whole time and attention were for many months exclusively devoted to the cause, which he had most ably managed, and for which he personally tendered his thanks to Mr. Collett, who acknowledged in a speech of some length, the compliment paid to him.—The Chairman proposed the health of Mr. Dacre with many thanks to him for the efficient and able assistance he had given to him and the cause in both Houses of Parliament throughout this protracted and laborious business.—Mr. Dacre returned thanks, and assured him and the parties that he was much gratified at the success of this praise-

worthy undertaking.—No unpleasantness or confusion occurred throughout the market or the entertainments, and too much praise cannot be given to Mr. Collet for the various requisite arrangements; he was ably assisted by the promoters of the new market, and a most efficient and well-behaved detachment of the police.

### THE GROANS OF THE SMITHFIELD DROVERS ON OPENING THE ISLINGTON MARKET.

No wonder, alas! that our features are wan,  
When our proud occupation will shortly be gone;  
When no more in the city our beasts will display,  
And the drovers from Smithfield be driven away.

I'm sure in our calling the public might see,  
There was never a squad more politer than we;  
Poor hard-working fellows, we always did right,  
And stuck to our duty by day and by night.

But, this Islington Market, of which people chaff,  
Will soon cut us up, and 'tis too bad by half;  
By the stick that we flourish, 'tis really too bad,  
Smithfield West to convert to a wilderness sad.

No more with our brutes to the spot we'll repair,  
Our mug to enjoy at "the Staff and the Bear;"  
Nor to the Old Bailey shall trot on our shank,  
For a plate full of pork, or of buttock and flank.

Now, as to the cattle we drew up to sell,  
Not a soul can deny we treated them well;  
Though, if beasts are unruly, I'm sure there's no sin,  
In sending a whop on the nose or the shin.

And we swear (and to truth we have always regard!)  
They never complained that we hit them too hard;  
And this here old maxim we couldn't dispute,  
That a marcful cove is the same to his brute.

The "cruelty hanimal lads" seem'd to think,  
That brutes should be furnished with summit to drink,  
'Tis true they might move many miles on the road,  
But if ever they ax'd for one drop we'll be blow'd!

But this Mr. Perkins, and who the deuce is he?  
Has been making himself most confoundedly busy;  
And swears that he means snug apartments to keep,  
For bullocks and donkeys, for pigs and for sheep.

And, he also has got the assurance to tell us,  
That we're nothing but vulgar and hard-hearted fellows;  
Now these purse-proud and insolent knaves ought to feel,  
That drovers are lads what can come it genteel.

If we're friends to reform, may we all go to prison!  
Least of all on the list of reform such as his'n;  
Reform which must sadly the butcher annoy,  
And the old *wested* rights of *West* Smithfield destroy.

Oh surely our tears each true heart will excuse,  
As our pens are deserted we *pensively* muse;  
Or sigh to our sticks as we view them with pain—  
"These never shall wollop a bullock again!"

Fortunc's door against us will be speedily shut,  
And our staff of existence (these sticks) will be cut;  
(Those sticks in our mawleys so useful before),  
But the sound of our *herds* won't be heard any more,

To old Smithfield, farewell! to each bullock and calf!  
Farewell to "the Bear and the old Ragged Staff;"  
With grief from those haunts we're destin'd to go,  
Where the *lowing* of cattle henceforth shall be low.

But in spite of this Perkins, this Islington buffer,  
Our friends we are sure won't allow us to suffer;  
And, if Tories get in, 'tis we hear their intention,  
For services past to allow us a pension.

Then, long life to Bob Peel in a bumper of sherry!  
Long life to the Duke and to Lord Londonderry;  
May the Whigs wery soon be turn'd out in despair,  
And Islington Market be blow'd in the air.

### FALLOWING.

The fallowing of land consists of a course of tillage continued for a certain time. When it is continued for an entire season, the process is termed the summer-fallow.

A course of tillage during only a part of the season is adopted in the case of preparing land for such crops as the turnip, the cabbage, the potato, which are thence frequently termed *fallow crops*. This preparation consists of a series of ploughings, harrowings, and other operations, continued until the land is cleaned and otherwise fitted for the crop to be cultivated.

The extension of the culture of fallow-crops has greatly lessened the necessity of the summer-fallow; for the ground receiving a good preparation for this class of crops, and they, from the wide intervals at which they are cultivated, admitting of an efficient tillage during their growth, the farmer is more enabled to dispense with the necessity of devoting an entire year to the tillage of his land.

It is chiefly on the stiffer clays that the summer-fallow may be held to be an essential branch of farm management in this country. These are tilled with greater difficulty than the lighter soils, and do not always admit of the cultivation of those particular classes of plants as the turnip, which are suited to the lighter soils, and which render upon them an entire summer-fallow unnecessary. A further reason exists for the adoption of the summer-fallow on the stiffer clays, namely, that the most valuable of their productions is wheat, for which the summer-fallow affords the best preparation. The manner of performing this process, therefore, merits the serious attention of farmers in this country.

Whatever be the nature of the soil to be fallowed, the first ploughing is in all cases to be given in autumn, or before winter, so that the soil may receive the influence of the winter-frosts, and the growth of weeds be checked; for certain weeds will grow during the months of autumn, and partially in winter and in early spring; but by inverting the surface, and exposing the roots of those plants, and the under part of the sod, to the frost, the vegetation is checked until the process of ploughing can be resumed in the following spring.

In all cases the first ploughing should be as deep as the plough can conveniently be made to go. A good plough with a pair of horses can easily plough from eight to nine inches deep, and this is in most cases an efficient tillage. But should the nature of the soil render it necessary, an additional force of draught must be employed, so that the requisite depth of furrow may be given. Thus, in some of the marly and tenacious soils of England, four horses may be occasionally required to give sufficient depth to the first ploughing of fallow. Three horses may be also used; these, with a good plough, forming an efficient team, which may be managed by one ploughman.

With respect to the manner of laying the ridges, that kind of ploughing must be adopted which is calculated to keep the land dry during the months of winter, this being an essential point of practice in the class of soils for which the summer-fallow is required.

A good method of preserving the land in a dry state is cleaving with open furrows. In this manner each ridge is divided into two, so that good provision is made for allowing the free egress of water.

Sometimes the ridges may be gathered, and at other times, when the land is moderately dry, they may be cast. In whatever manner the ridges are ploughed, they remain in the same state till the following spring, and care therefore must be taken that all the

cross-furrows and channels shall be made and carefully cleaned out, so that no water may stagnate upon the field.

In the ordinary management of the farm, the first operation in spring, as soon as the weather allows, is the sowing of the spring-crops of corn. When this essential labour of the season is completed, which in this country is generally from the middle to the end of April, the tillage of the land intended for such crops as the turnip, the potato, and other fallow-crops is to be resumed. But though these are the first in the order of preparation, and must necessarily be first attended to, yet the summer-fallow should not be neglected at this early season, but should receive one ploughing not later than the month of May, and the earlier in the month the better.

Now this, the second ploughing of the summer-fallow, may be done in two ways. The land may be either cross-ploughed, or ploughed in the direction of the former ridges. On the lighter and drier soils, in the cases where such soils are subjected to the summer-fallow, the cross-ploughing is the better method. But, in the case of the stiffer clays, the ploughing in the direction of the former ridges is to be preferred; for this is a provision against the effects of heavy falls of rain, which, were they to occur at this early season, when the land was ploughed, without open furrows to carry off the water, might so saturate it as to render the subsequent tillage precarious and difficult.

The next ploughing, which is to be as early in June as the other labours of the farm will allow, is to be made across. Immediately after this ploughing, the land is to be harrowed by repeated double turns, the direction of each double turn crossing that of the previous one. These double turns are to be repeated four, five, or more times, as occasion may require; and the roots of all plants which are dragged to the surface by the harrows are to be carefully collected by the hand and laid in heaps. A cart then passing along the rows of heaps, the collected plants are to be forked or thrown into it, and carried off the ground. They are to be formed into a compost by being mixed with quick-lime, so as to destroy their vegetative powers.

Sometimes these weeds are burned on the ground, and their ashes spread upon the surface: but this practice is not to be imitated, the ashes yielding an inconsiderable quantity of manure as compared with that which is produced by forming the weeds into a compost.

It is of great importance at this period of the summer-fallow, to drag to the surface and collect as large a portion as possible of the roots of vivacious weeds in the ground; for, this being the period of active vegetation, every part of these roots which is left in the ground will grow again and extend itself.

It is by the repeated action of the harrows that these roots are detached from the soil and dragged to the surface. When necessary, the roller is also to be employed. This, bruising the clods or indurated masses of earth upon the surface, enables the teeth of the harrow to act upon them. When the roller passes over the ground, the harrows immediately follow.

At this time, too, the grubber may be employed, as subsidiary to the action of the harrow.

This is a period of the summer-fallow at which all obstructions arising from land-fast stones and other impediments to tillage are to be removed; and if drains are required, it is now convenient to form them, the stones collected upon the surface being led forward at once to the drains, and filled into them in the manner to be afterwards explained.

This, indeed, is merely matter of convenience when the stones are in readiness, for the time of Summer-fallow is not really the best for the forming of drains, owing to the hazard of heavy rains occurring, and carrying the soil, which is then loose, into the drains. This, however, is but a contingency, and there is convenience in forming such drains as may be needed at this time: and not only at this time, but during all the subsequent operations of the summer-fallow, draining, the removing of obstructions to tillage, and other works, are carried on. The obstructions of this kind to be removed are, generally speaking, any thing that may impede the path of the plough, and interrupt the common operations of tillage,—such are the roots of trees, stones, inequalities of the surface, and the like.

It has been seen, then, that, in the management of the Summer-fallow, the first ploughing is to be given before Winter, when the land is ploughed lengthwise, in such a manner as that the land shall be kept dry until the tillage can be resumed in the following spring; that the second ploughing is to be given as early as possible in May, and, in the case of stiff soils, lengthwise; and that the third ploughing, which, in the common course of farm-labour, we may hope to accomplish in June, is to be given across, when the principal labour of harrowing, rolling, and disengaging weeds, is performed, and when opportunity is taken to begin to drain, clear the ground of stones, and perform similar operations required.

As soon after the last ploughing and cleaning as the state of the weather and the labours of the farm will allow, the fourth ploughing is to be given. This ploughing may be performed in two ways. It may either be given lengthwise, and the land formed into ridges, or the whole may be ploughed in large divisions, without regarding ridges, as in cross-ploughing.

The former method may be adopted when the season is critical, and the land stiff and naturally wet. This is in order to avoid further hazards from the great falls of rain; for, by forming the land into ridges, it is placed in a state of comparative security. But it allows of a better subsequent tillage of the land to lay it flat, by ploughing it in large divisions, without yet forming it into ridges.

In this case, the land may be ploughed in a direction at right angles to the previous ploughing, that is, in the direction in which the future ridges are to run: but it will be better to plough somewhat diagonally, that is, nearly in the direction from corner to corner of the field. This is done in order that two successive ploughings may not be in one direction, for the next ploughing to be given, as we shall immediately see, must necessarily be lengthwise in the direction of the ridges. But by deviating from this direction with the ploughing now to be given, the two successive ploughings will cross each other, and thus the tilling will be better performed.

No sooner is this diagonal ploughing completed, than the process of harrowing, rolling and cleaning the ground of the roots of vivacious weeds is to be renewed, precisely as after the preceding ploughing. It is not necessary or expedient that the process of harrowing shall be carried further than is absolutely required to disengage the weeds; but to this extent it is important that it be carried, so that the land may now be cleaned.

These two ploughings, with their corresponding harrowings, are of the utmost importance in the management of the summer-fallow. If the weather has been favourable, the land may now be expected to be effectually cleaned, and thus far to be in good order. Sometimes a further ploughing may be re-

quired for the purpose of completing the cleaning process, but whether this be so or not, the land ought now to be formed into ridges. This is necessary, in order to provide against the contingency of heavy rains, which, were they to occur at this period, when the land is lying in a flat state, might so soak it as greatly to retard the future labours.

We now, therefore, proceed to strike the furrows in the manner formerly explained. The land is then ploughed and formed into ridges, and this completes the fifth ploughing which it has received. The land will generally be now ready to have the dung laid upon it. But in some cases it may require a sixth ploughing before it is sufficiently cleaned and prepared for the dung. In this case, the land being harrowed, and the remaining weeds collected as formerly, it is ploughed again in the line of the ridges.

We may proceed, however, upon the supposition that this further ploughing and cleaning are not required, and that the land, after the fifth ploughing, is ready for the application of the dung. This may bring us, in the ordinary course of farm-labour, to the month of August.

Now the dung, according to the practice before described, has been previously led out and laid in large heaps in the field, where it has undergone a certain degree of fermentation. Should this not have taken place sufficiently, the heaps must be turned, so that the dung may be brought to a fit state for use.

The dung is now conveyed to the land in carts from the heaps, the carts being driven along the ridges. It is dragged out from behind by the workmen with the dung-drag into heaps, as nearly as possible of equal size, and at equal distances, in rows along each ridge. Sometimes, to ensure accuracy, the ridges are divided, by furrows run across them, into rectangular spaces, each space receiving its allotted quantity of dung. But in general the eye and practical knowledge of the workmen will enable him to drag out and deposit the heaps in the quantity, and with the accuracy that may be required.

Several persons, who may be females or young lads, then spread out the dung all across the ridge, by means of light three-pronged forks. This operation should be done with much attention, so that the dung may be spread regularly over the ridge.

Close upon the work of the spreaders, the ploughs are to follow and cover the dung. This is done by gathering the ridge, so that, while the ploughing covers the dung, the curvature of the ridge is increased.

The dung being covered in this manner, and the ridge raised, the land is to remain untouched for a few weeks, so that the dung may be decomposed and incorporated with the soil. When the dung has been previously fermented in a proper manner, this incorporation will be completed in a very short time.

The land is now ready to receive what is called the seed-furrow, which is the ploughing given to it previous to the seeds being sown. In this ploughing the ridge is again gathered, but the ploughing being very shallow it has little effect in raising the ridge higher.

After this final ploughing, and upon the surface now exposed, the seeds, usually of wheat, are to be sown, in the manner to be afterwards described. This generally takes place about the middle of September or later, and completes the important operations of the Summer-fallow and sowing of the wheat-seeds.

In this detail the manner of applying the dung has been described, but there is likewise to be considered the manner of applying lime, when this substance is to be laid upon the land in Summer-fallow.

There are two periods at which the lime may be applied,—either before the dung is laid on, or afterwards. In the former case, the lime may be laid on just after the land has been formed into ridges, and when it is ready to receive the dung.

The quicklime, as it is brought from the kilns, may be laid down in heaps of about five carts each, at regular distances, upon the head-lands or where convenient. In this case, it is brought to the farm as opportunity offers, and slacked slowly and regularly.

When we are prepared to spread it upon the ground, a person with a broad-pointed shovel is appointed to each heap. He fills his cart, drives it along the ridge, and spreads the lime abroad upon the surface, taking it out with his broad-pointed shovel from the cart behind; sometimes two carts and two men may be appointed for each heap, the one man filling the cart at the heap and the other spreading the lime upon the ridge.

Both men and horses sometimes experience injury from the caustic effects of the lime, especially when the weather is moist. The face of the man may be defended by a thin handkerchief, and the back of the horse should be covered.

When the lime is spread, the land must be immediately harrowed, to incorporate the lime with the soil. This being done, the dung is to be spread upon the ground, and covered by the plough in the manner before described.

But frequently the dung is first spread, and the lime is not laid on until just before giving the seed-furrow. This answers very well, provided the land has lain a sufficient time after the dung has been spread, so that it may be decomposed and mixed with the soil.

These details have an especial reference to the stiffer soils, which are those on which the Summer-fallow is generally practised. When the lighter soils are to be fallowed, the process of cleaning is more easy, and there is less hazard of serious interruption from the state of the weather. The only variation with regard to the lighter soils that need be referred to, is in the first spring-ploughing. In the case of such soils this ploughing may be given at once across, and the process of harrowing and cleaning then commenced. This is precisely the management pursued in the case of turnips and similar fallow-crops; so that, when the learner comprehends the operations of the summer-fallow thus far, he is acquainted with the manner of preparing the land for an extensive and important class of plants.

In the preceding detail the ordinary operations of the summer-fallow have been described, but the nature of the seasons, the state of the land, the prevailing weeds to be eradicated, and other circumstances, produce variations in the course of management, which, however, it is not necessary here to point out. They are little subject to rule, but are best determined by the judgment of the farmer, as the cases themselves arise. A more important purpose is served to the student of agriculture by pointing out to him the manner of managing the summer-fallow upon approved principles. Knowing this, a little experience will soon show him how to adopt those variations of practice which the state of the season and other circumstances may render expedient.

The process of the summer-fallow, conducted as it should be, enables us to effect the tillage of clay-lands in a manner calculated to eradicate weeds, and fit the land for bearing a lengthened rotation of crops.

After a complete summer-fallow, the land is seen to be in the best order which circumstances will allow. It acquires that mellowness, indicative of fer-

tility, so familiar to the eye of the farmer, yet so difficult to be described. It is frequently observed by farmers, that clay-lands in this climate get into an adhesive, and, as it is termed, a sour state, by the long repetition of crops. The giving them from time to time the mellowing influence of a summer-fallow, during which weeds may be extirpated and the manures applied in the most beneficial manner, is found to have the best effects in restoring the fertility of the soil and fitting it to yield an increased produce in succeeding years. One advantage, too, of the summer-fallow, not to be disregarded, is, that it divides the labour of tilling a farm more regularly throughout the season.—*Low's Agriculture.*

## CUSTOMS BETWEEN LANDLORD & TENANT, AND THE INCOMING AND OUTGOING TENANT.

(FROM KENNEDY AND GRAINGER'S CUSTOMS OF COUNTIES.)

### BERKSHIRE.

There is in general, no restriction upon a tenant as to the cultivation of the land or the mode of cropping it, previous to the last year, or in some places the last two years of his lease. Up to that time, he farms and crops the land as he pleases; but he covenants in his lease to leave, the last year, a stated number of acres for fallow, which are usually out-stubble. Where the restriction extends to the last two years, the tenant is bound, the last year but one, to fallow the land from which, the year preceding, he took a crop of oats; that from which he takes a crop of oats the last year but one, he leaves the last year as fallow land. The restriction upon a tenant to leave a certain number of acres for fallow at the expiration of his term, does not bind him to leave them in particular parts of the farm, only that so many acres are to be left; and it sometimes happens, that all the worst of the land is left for an incomer, which is a serious consideration, the land on the hills being generally very indifferent.

A similar custom prevails with regard to hay and straw; a tenant having the privilege of selling hay and generally wheat straw, (although, in some places, he is only allowed to exchange it for dung,) during the term of his lease, until the last crop. The wheat straw of the last crop he is bound to leave upon the premises for his successor, either for the purpose of thatching, or for any other use to which he may choose to apply it. He is also obliged to feed the hay crop, or as much of it as he can use during the time, and cannot remove any from the farm; the oat and barley straw he likewise covenants to feed on the premises during the whole of the term.

The outgoer has no demand upon the incomer for any crop or labour, excepting for the clover or other grass seeds upon the ground, for which he receives the value of seed and labour; and although the incomer has the privilege of entering upon the fallow land at Lady Day, yet the outgoer pays all the rent up to the time of his quitting. The incomer, having the above-mentioned privilege, has sufficient time to plough all the land for his turnip, or wheat fallows, which land, his predecessor cannot touch after the last Michaelmas but one of the term of his lease, without being hired or authorized so to do by the incomer. If the outgoer does not feed all the hay

crop, the remainder is valued to his successor; but merely at a feeding-out price. This is the only article, with the exception of the grass seeds, which an incoming tenant is bound by the custom of the county to take. But from the want of any restriction, previous to the last one or two years of a lease, a tenant entering upon a farm in this county is generally at the expense of much labour for several years, without receiving any adequate return.

MODE OF FARMING, IMPLEMENTS, &c.—Through the system acted upon in Berkshire, the soil generally speaking, is very much out of condition. A tenant, up to the last one or two years of his lease, drives the land as hard as he possibly can, and, in fact, leaves it entirely run out: thus, the labour of several years is required to put it into any thing like a good condition; whilst by the time A. has brought his land tolerably round, his neighbour B. perhaps intends to relinquish his farm; and thus is kept up the neglected appearance of the country. Where a farmer cultivates his own property, it is, in consequence of this system, generally seen to the greatest advantage, like a fat sheep amongst a lean flock; and in the neighbourhood of Reading some well-cultivated land may be seen, which is chiefly managed by the proprietors themselves.

A great quantity of oats is grown in this county; they are most commonly the last crop taken before the land is fallowed: the rotation on the turnip land is—first, turnips; second, barley or oats; third, seeds; fourth, wheat; fifth, oats: upon the heavy land—first, fallow; second, wheat; third, beans; fourth, wheat or oats—if, fourth, wheat, then, fifth, oats. The land is, generally speaking, tried to the utmost.

Great quantities of chalk are laid out upon the land as manure for turnips, and for all kinds of grain; it is the chief article used in this way, with the exception of the produce of the farm-yard: there is, however, a practice frequently adopted in Berkshire, for the purpose of manuring the land for a turnip crop, which consists in ploughing the stubbles after harvest, and sowing them with turnips, which are fed off the last of all; and thus a fallow is made of the land for a seasonable crop, which is manured by the feeding off the stubble turnips; rye is likewise used for the same purpose, being sown as forward as it can be in the autumn, and fed off during the month of April.

The plough most commonly used in Berks very much resembles that employed in Norfolk, but it is generally drawn by four horses, driven double, a boy usually leading the two near horses, by means of a cord.

The drill is very little used, excepting for peas and beans, where the land will allow of it; on the heavy soils beans are chiefly planted by the dibble; the wheat, and other kinds of grain, are sown by the hand. The land-press, which on the light soils is frequently wanted, has not been long introduced into use, but it meets with general approbation.

Very little draining is performed in any part of this county, not, certainly, because there is no need of it, but on account of the expense; in most places, however, whatever draining the tenant wishes to have done, the landlord is willing to supply the material.

The outbuildings are chiefly thatched, and sided with weather-boarding; they, as also the gates, and other dead fences, are always put into a good state of repair at the commencement of a lease, after which they are covenanted to be kept so by the tenant, the landlord, however, finding the materials, but which are converted to the purpose for which they are wanted, at the expense of the tenant.

## RETROSPECT OF THE WOOLLEN TRADE.

Our markets continue in the same state of activity which has prevailed with little fluctuation since the beginning of the year. Thus far there are no appearances of interruption; on the contrary, goods yet find purchasers as fast as the manufacturers produce them, and in some particular cases orders of the most legitimate character cannot be executed within the time required, not because that time is too short under ordinary circumstances, but simply because hands are not forthcoming to do the work.

Such a state of things ought naturally to be regarded with much satisfaction. If that satisfaction as to present effects be dashed with a shade of anxiety for future consequences, it is because men have learnt by experience to scrutinize attendant circumstances, to distrust the permanency of any thing approaching to an extreme, and to dread the chance of a re-action. Such caution is not unreasonable. The two periods of 1825-6 and 1833-4 furnish important lessons which may be read with advantage as often as appearances seem to indicate a departure from steady principles; or even if they serve only to moderate the ardour of expectation under auspices of less doubtful character. The present moment offers points of comparison with both these periods. Joint-stock speculations are again rife, although less so than in the first of these years; and the prices of commodities have again reached an elevation only inferior to that of the latter period. But there is one material point of difference also. To whatever extent of speculative excitement the present high prices may be owing, the manufacturers have resolutely kept themselves free from all such influence, and have cautiously limited their purchases of wool so as just to meet the effective demand for goods from week to week. The consequence is, that come what may, they are prepared for a change at any moment, or however sudden; they have no heavy stocks of dear goods to run off as they had in 1834; at the close of each market the stands in our Cloth-Halls are pretty well cleared, and are ready to receive fresh supplies for the next. In this way the manufacturers are sure to protect themselves from the ruinous losses they have experienced on former occasions; and if the buyers of goods have been equally careful in their operations, it is quite clear that trade must be in a state so sound that even a sudden check in the demand might occur without doing serious mischief; because, from first to last, every one would be prepared for a reduction in prices which must necessarily ensue. But this is precisely the point of uncertainty which leaves room for hesitation: the foundation of this active demand for goods is matter for conjecture rather than demonstration; and at no period, perhaps, has it been regarded with greater anxiety than it creates at this moment.

The supply of our home consumption is at all times a most important item in our trade, and from the favourable circumstances of our population generally, it is fair to expect that much augmentation of demand may have arisen from that source. It is, moreover, a source of demand much less exposed to risk and uncertainty than that of distant markets, because the producer and the consumer are almost in immediate contact; and hence the extent of the supply is more promptly adjusted to the variations of real effective demand.

As to foreign demand, one thing has become quite certain: the markets of Europe afford no encouragement to the continuance of high prices. Our old customers in Germany, in Holland, in Belgium, and in Portugal, are all alike indisposed to pay the prices now demanded from them. The season of operations is returned, but orders are given to a very limited extent, and with great reluctance, or are withheld altogether. The goods required for these markets are chiefly made of English wool, which maintains a price out of all proportion with that of foreign wool. Such disproportion is, of course, highly in favour of the native manufacturers in those countries which possess any; and it happens that those countries where there are no manufactures worth naming are so glutted with accumulated stocks of English goods that they care not for further supplies at almost any price.

Of the more distant markets, that of the United States alone is of importance sufficient to influence the state of prices here at almost any time; at a wavering moment, more especially the difference between a brisk and a languid demand for that country may decide the question of advance or decline in our markets. Supplies have gone out freely for some time past, and certain descriptions of low goods are yet much in request; but, generally speaking, the American merchants and exporters regard the advance which has taken place latterly with an eye of suspicion, and are disposed to proceed very cautiously in their further operations. It is only to be lamented that so much of the trade to the United States has fallen into the Consignment System that outward appearances are no longer a safe indication of the real state of things there. The markets of South America, again, are supplied altogether under that system: and such, also, in a great measure, is the case with those of India and China. Much has been done, and much is yet doing, for those parts of the world; but what may be the result remains to be seen. The China market has been but recently opened, and has given a great impulse to manufacturing enterprise during the last two years. The result may prove satisfactory, and no doubt will prove so to a certain extent; but experience teaches that the uniform tendency of enterprise so directed is towards excess of supply, until the new market becomes overloaded with goods, and finds relief only by means of sacrifices which impose a check upon such excess, and thus a due relation between supply and demand becomes established. The first private trade shipments of woollens sent out on the opening of the India Trade, upwards of twenty years ago, left a handsome profit; but three years afterwards the very same goods fell to half the price, without any corresponding alteration in this market, and left a loss equal to the former gain. Time alone can show to what extent the China Trade may be prosecuted with advantage, and how nearly the present speculations have hit the mark.

Remote markets are the field whereon the glories of the Consignment-Agency principle have ample scope for development: imagination may exhaust itself in the invention of flattering representations to catch the unwary; at such a distance the speculative adventurer has small chance of learning their real value except at the price of bitter experience; and the length of time which must elapse before the actual result of a first adventure must come to light is such that by a judicious improvement of the opportunity a regular

succession of shipments, and a rich harvest of Commissions upon them, may be secured before the credulous victim gets his eyes opened to the delusion practised upon him. The two parties to this operation are the merchant or manufacturer who supplies the goods, and the consignment-agent who sells them. The former has means to find, skill to exercise, and all risks to run, for the mere chance of a profit; the latter contributes nothing to the undertaking save the mere *brass* of assurance, his skill consists in the practice of deception; risk he has none whatever, and his profit is certain. The former may chance to get his own again; by great good luck even realize a profit; or he may lose half the value of his property, and find himself ruined; but no such contingency awaits the latter: as much as 7½ per cent. in the shape of Commission, and perhaps half as much more in the shape of simulated extra charges in account-sales, may be the consignment-agent's portion in certain cases; and with this in his pocket he rides his high horse in search of new game.

Such is the consignment system; and any portion of the late and present activity in our markets which may be owing to an extension of that system, may well be regarded with suspicion. Our Exports of woollens rose from £5,975,415 in 1834, to £7,046,829 in 1835, but whatever may be the prospects in other quarters of the world, we certainly must not look to European markets for a proportionate demand this year. It has been suggested that much of the existing spirit of speculative enterprise has been encouraged by the extended facilities which the liberality of the new banking establishments affords. The same facilities which induce speculation in public works will undoubtedly affect commercial operations also; and in the absence of opportunity for their employment in the ordinary channels, we may expect to find them seeking others of a nature altogether experimental, or of a character perhaps not over safe. Prices will be affected, as well by the augmentation of demand which must arise out of this state of things, as by the ability of holders to keep out of the market in the hope of obtaining still better terms. The advance will be greatest upon those articles of native produce which are consumed chiefly in the manufactures of this country; and this, precisely, is the situation of English wool. The growers have little to fear from the competition of foreign wool, because the character of the article is essentially different; and still less are they dependent on foreign demand for a market, because the consumption at home is equal to the entire produce. Nothing can affect this consumption save an advance of price so out of proportion as to diminish the demand for goods made of English wool, and thus cause other fabrics, more reasonable in price, to be substituted for them. In the markets of the world no merely artificial advance of price can be permanently maintained, whether it be the effect of banking facilities, or legislative protection. A length of time may be required to elapse before the consequences become fully developed, but they are certain in the end, and in the nearer markets they are already visibly enough. Since the early part of 1833, the advance upon English wools has fluctuated between 50 and 100 per cent, and may now be stated at from 60 to 70 per cent; they have rarely remained stationary for three months together, and for the last twelve months the advance has been constantly progressive.

During all that period the produce has been abundant; not only fully adequate to the demand for consumption, but also to compensate for the effect of a previous rot amongst sheep. Mr. John Houghton, in his recent evidence before the Agricultural Committee of the House of Commons, considers the first advance in wool, five years ago, was in consequence of the rot. "I was a holder myself seven years," he says, "and at last sold for 20s a tod in 1830." This would be the time just preceding the rot. The "prosperity of the manufactures," to which he ascribes an extension of demand and the continuance of good prices, he considers "to have commenced only two years ago;" and he adds "when I say that the rise in the price of wool might be occasioned by the great rot in sheep, I think unless the manufactures had been prosperous, we could not have maintained the price as it is now; for I think the rot has been sufficiently got over, and we have got back to the same state as the year before;" that state, namely, in which Mr. Houghton held a seven years clip, and sold it for 20s a tod, or about 8½ per lb. The present price of the same wool would be not far short of 1s 8d½ per lb.

It is admitted that the high price of wool has been the salvation of the English farmer all this time; hardly any other article of his produce would fetch a living profit, and for his chief article, grain, he cannot even barely remunerate himself. The same state of things prevails on the continent. The *Allgemeine Zeitung* in a recent article on the subject of the German farming interest, says—

"The farmers have hoped in vain for an improvement in the prices of grain: all combinations have thus far proved illusory. The continental corn-growers cast a longing eye towards England, to whom they certainly wish every possible good, but another deficient harvest amongst the rest, in order that she may be forced to buy grain from them."

Amiable creatures! How infinitely obliged we are to you for your readiness to supply us with your grain, and to dispense with our manufactures in return. Your good wishes beat those of the Archbishop of Granada hollow: he, too, had a stiff-necked subject to deal with, who refused to admit the merit of his homilies. "Va, Gil Blas," was his valedictory address to the hardy critic; "je te souhaite toute sorte de bonheur, et un peu plus de goût."

The writer of the article then reviews other descriptions of farming produce, and grazing stock, which yield a better return than grain, and he continues thus:—

"Of animal productions wool yet remains the most profitable: the demand for it is so lively, and increases so much, that it far exceeds the supply; and prices have, consequently, already sustained a considerable advance. According to all appearances this will extend yet further. True, it is stated in our public papers that this lively demand applies chiefly to the middle sorts, and this is easily accounted for: because the middle sorts are always most wanted, and are, at the same time, always produced in much larger quantities than the fine sorts; hence the less important demand for the latter furnishes no ground for complaint, and prices are as much advanced for one as for the other. But we must guard against an error which may easily be committed in reference to such statements: it is usual to reckon the advance on both sorts by per centage, whence a much greater positive advance must be taken upon the finer than

upon the middle sorts, in order to bring them to the same rate in the scale. For instance, if we take last year's prices at 130 dollars for the finer, and 80 dollars for the middle sorts, an advance of 10 per cent. would make 13 dollars upon the former, and only eight dollars upon the latter; but the grower will be fully content if he gets only just as much more for his fine as for his middle sorts, because the advance in both cases is to be regarded as so much clear profit. If we consider that the production of improved wools is much easier now than it was formerly, whilst the prices have yet always maintained the same elevation, it is quite clear that sheep-breeding must pay much better now than it did before. Sheep of the improved breed are now to be bought much lower in price; the treatment of them is much better understood, consequently there are fewer losses; and experience has shown the value of attention to full-woolled animals, whence a greater quantity of wool is produced from the same number of sheep.

"So long as we remain at peace, so long will this favourable state of things continue; and even the event of a war might make it more so; but the advantage would be temporary only, and the subsequent shock would be felt the more sensibly. For a series of years, therefore, the breeders of sheep enjoy a fair prospect of realizing highly remunerative prices for their wool. It is true that the improved breed is constantly extending to countries where its cultivation is yet susceptible of immeasurable increase; but intelligence is an important element in this branch of farming industry, and this cannot be bought along with the improved sheep. Poland may be adduced as an example on this point: for more than a quarter of a century large numbers of the improved animals have been introduced into that country; yet compare Poland with Silesia, and it will be found that we are correct. On the other hand, Hungary and Transylvania will soon be in a condition to assume an important weight in the scale of European commerce with the world; and Germany will require the exercise of all her industry, and all her intelligence, to maintain her stand as the first in the market. Meanwhile the awakened spirit of emulation in these two countries yields the German breeder that profit which arises from the good sale of his supernumerary brood-flock."

These are encouraging prospects for the continuance of an effective supply of foreign wool fully adequate to any amount of demand likely to arise, and the whole history of the trade for years past demonstrates the facility with which the produce can be extended as circumstances require. With the single exception of the excitement which prevailed through the winter of 1833-4, the prices of Foreign wool have experienced no undue fluctuation; but as often and as regularly as an extra demand has arisen, extra supplies have been forthcoming to meet it, and extravagant prices have been avoided. Fine cloths are almost as cheap now as they ever were.

The manner in which the produce of Foreign wool has been augmented will be seen from the following statement of the quantities consumed in this country for the last seven years; and we annex, also, the exports of woollen manufactures for the same period:—

	Foreign Wool entered for consumption.	British Woollen manufactures exported.
1829 .....	lbs 22,614,550 ..	£4,587,603
1830 .....	31,522,859 ..	4,728,666
1831 .....	29,669,908 ..	5,232,013

	Foreign Wool entered for consumption.	British Woollen manufactures exported.
1832 .....	27,587,475 ..	5,244,479
1833 ..	39,066,620 ..	6,292,432
1834 .....	40,840,271 ..	5,975,415
1835 .....	43,185,993 ..	7,046,829

It thus appears that the consumption of Foreign wool has nearly doubled within seven years, and the exports of woollen manufactures are increased by about half.

There is every probability that the imports of Foreign wool this year will prove abundant: the quantities entered at London, Bristol, and Hull, as made up on Tuesday last, and compared with the corresponding quantities to the same period last year, stand thus:—

	DUTY PAID.			
	Foreign Wool imported.	In 1836 to last week.	1835 to the same period.	Excess in 1836.
To  Bristol .....	lbs 71,120 ..	66,608 ..	4,512	
.. London, Spanish ..	897,871 ..	293,116 ..	604,755	
.....Australasian ..	350,161 ..	201,900 ..	148,261	
.....Other sorts ..	5,675,207 ..	2,791,840 ..	2,883,367	
.. Hull .....	4,111,295 ..	1,638,714 ..	2,476,491	
Total .....	lbs 11,109,564	4,992,178	6,117,386	

Here we have an import, thus far, of more than twice as much this year as last; and yet we are within six weeks of the new clip. At this late period it is fair to presume that the old stocks on the Continent have been pretty far sought into, in order to furnish for such an excess in quantity; and we need not, therefore, feel surprised that amidst such plenty the wool dealers and consumers should still complain of want of choice in quantity. At the same time it is equally fair to presume that the prices current in England must have been found by comparison a great temptation to induce supplies of such a nature and to such an extent.

It would be unjust to close an article on the wool trade without allusion to the progress of Microscopic discovery; although we can do little more than condole with our readers on the disappointment of their promised lectures. Whether the discovery be considered not yet sufficiently ripe for promulgation, or the public be considered yet too unenlightened for its reception, we cannot decide; though we have a strong leaning towards the latter assumption. At all events it is some consolation to find that certain progress has really been effected in the former; and the public must be content for the present to know that all the properties which have hitherto been ascribed to wool exclusively, are found to apply equally to Hair of any kind. "All flesh is grass," saith the preacher; all hair is wool, saith the philosopher. Well may he call the discovery an important one to dyers; it is important indeed; for as we have many varieties of natural colour and shade in hair, it may come to pass that a great portion of our cloths and stuffs will require no dyeing at all. Here is another field for enterprise!

A strict regard for justice, however, compels us to add that we have some serious doubts as to the originality of the discovery. We have a somewhat lively impression that our old acquaintance, Aaron Bang, once presented himself at dinner in a new coat of glossy black cloth, which he declared was from the first clip of emancipated negro-wool. Nay, we have an indistinct remembrance, even, that he said it had been manufactured somewhere in this neighbourhood. We begin to suspect that friend Bang may have had communication with a Genius still more hair-brained than even Tom Cringle.—Leeds.

## AGRICULTURAL REPORTS.

### GENERAL AGRICULTURAL REPORT FOR APRIL.

During the last six days of March, the nights were cold and frosty, even to the production of thickish ice; but April, its place in the Calendar considered, has been, so far, the most sloppy, and otherwise the most ungenial month of the present year; it having, by its frequent frosts, that pervaded nearly the whole of the first fortnight, the peltings of the storms, &c., in some measure destroyed or greatly tarnished vegetation. However, since the 18th the temperature—notwithstanding the wind has been frequently vibrating between the north-west and north-east—has been sufficiently mild, to have considerably renovated vegetation, and it may now be considered, both from our own observations, as well as the correspondence and verbal intelligence we have received, from most of the farmers and other country gentlemen with whom we have communicated, as quite forward enough, to be productive of abundant crops, of every description of Summer and Autumnal farm produce; both of which have often experienced a detrimental check, from the bleak atmospheric visitations of an early May. Field labours are not materially out of their place, and are by far more forward than has been represented by some of those who are interested in advanced prices, either as holders, speculators, or growers of heavy stocks of British corn, under the purlblind impression that the heavy duties on foreign grain—which are now in the 8th year of their pupillage—would have enhanced prices, which they have scarcely accomplished to the amount of the smallest money fraction per qr.

A very great breadth of early sown barley is described as being well above ground; and wheat, oats early sown, or dibled beans and peas, plants as well as meadow and seed mowing grasses, pasture herbage, &c. being in a fresh, healthy, and somewhat thriving state; inasmuch as an abundant, though a somewhat backward hay season appears to be anticipated, both by those who supply the metropolitan hay markets, and farm at remote parts from them. Also the ewe flocks and their lambs, the most backward of which are now become sufficiently strong—though some of them have suffered from the effects of the cold rains of the first half of the month—to encounter almost any weather, are described, with other live farm stock, as generally healthy and doing well; but the deficiency of turnips, and the inferior quality of the greater part of last year's growth of hay, and consequent unripeness of the sheep and beasts, reserved for Spring and the early part of the Summer, is still loudly complained of, both by butchers and graziers; the former declaring that they die so badly—i. e. yield so little internal fat—consequently weigh so light, that they lose money by all they slaughter; the latter, that they have paid them nothing, for attempting to fatten them.

As relates to the legislative part of their solicitude, both landowners and farmers, or, at least, the discerning part of them, seem to be at length thoroughly convinced that our legislature can afford them no further relief than a wholesome

commutation, or an entire abolition of tithes. They appear to consider both the parliamentary and central agricultural committees as having been wholly useless; whilst many of the latter seem to hope that the former will, speedily, after the tithe question has been legislated, reduce the size of their large farms, they considering 1,000 acres of good land, divided into three farms, would produce nearly, or quite, 50 per cent more rent, than if let in one farm.

As relates to the prices of farm produce, those of fat stock and wheat have been, in the course of the month, considerably, of hops, wool, poultry, and dairy produce, somewhat, but not greatly, on the advance: whilst those of barley, oats, beans, peas, malt, seeds, flour, milch cows, store pigs, suckling calves, and good horses, about stationary: but both the prices of wheat and fat stock have been, during the last fortnight, somewhat drooping.

The following is a retrospective statement of the supplies and prices of the stock exhibited, and, for the most part, sold, in Smithfield Cattle market, from the 25th of March to the 25th of April, both days inclusive; as also a comparative statement of supplies and prices of the stock exhibited and sold in it on Monday, April 27th, 1835, and April 25th, 1836.

		SUPPLIES.

SUPPLIES.

Beasts	2,602	2,550
Sheep and lambs	20,770	16,050
Calves	130	220
Pigs	440	400

By the foregoing account, it appears, that beef was from 4d to 8d; mutton, 10d to 1s 2d; lamb, 6d to 10d; veal, 10d; and pork 6d to 8d per 8lbs dearer, on the 25th of April, 1836, than at the corresponding period of last year, viz. April 27, 1835, whilst there were 52 beasts, 4,720 sheep and lambs, and 40 pigs less: 90 calves more on the former than the latter market day.

From the 25th of March to the 25th of April, about 950 of the beasts came up the St. Alban's road; about 1,120 the other northern roads; about 6,250 from Norfolk; 950 from Suffolk, Essex, and Cambridgeshire; 930 from the western and midland districts; about 1,750 by steam vessels from Scotland; about 400 from Sussex, Surrey, and Kent; and most of the remainder, including about 150 townsend cows, from the stall-feeders, cow-keepers, &c, in the neighbourhood of London.

More than a moiety of the above beasts have been, this month, chiefly Scots, from various quarters; accompanied by about equal numbers of Herefords, and Welch runts; with about 340 Sussex, and a few Irish beasts.

The Mutton season of our northern districts, having commenced, nearly, or quite, half of the sheep—most of the coarse-woolled breeds being out of their wool—have come from our northern districts, viz. Lincolnshire, Leicestershire, Northamptonshire, &c; from Norfolk, Suffolk, Essex, Cambridgeshire, Kent, Sussex, Surrey, and our western districts; a full moiety of those from the north, consisting of chiefly new Leicesters, of the South-down and white-faced crosses; about a fourth South-downs; some, but not a great number, of old Leicesters and Lincolns; and the remainder, mostly of Kents and Kentish half-breds, polled—with a few horned—Norfolks, horned Dorsets and Somersets, horned and polled Scotch and Welsh sheep, fattened in England, with about 1000 white and black-faced sheep, from Scotland.

A great proportion of the month's supply of lambs—nearly half of which have been South-downs, the rest, not far from equal numbers of Dorsets and Somersets—have come from Surrey, West Sussex, the Isle of Wight, and various other quarters.

There has been, in the course of this month, as well as the last, a considerable quantity of slaughtered meat, particularly mutton, from Scotland, and the north of England.

LINCOLNSHIRE.

The weather almost the whole of the last month was *stormy and wet*, leaving but few days at intervals to proceed with corn sowing, and the seed time has thus been protracted to an unusually late period. The East Fen is the only district, from its extremely dry soil, which got sown in the proper season. The Wolds are on the eve of completing their seed time, according to the ancient adage—"On the day of St. Mark (25th of April) throw the Hopper into the Ark!" The Middle Marsh and other clay soils will not have finished for more than three weeks, and in some instances beans are even yet to be sown. The young wheats upon clover leys and oat stubbles appear weak, thin, and backward, and upon some parts of the East Fen and other light soils, the wire worm has commenced its customary depredations, while that upon the heavier lands after a Summer fallow, which was earlier sown, look strong and healthy. The oats and barley which have appeared above the surface, look pale and sickly, and are much in need of warm dry weather. The young seeds are well planted, and likely to produce abundance, either for sheep keeping or the scythe, a greater breadth of which has been sown than in former years. The lambing season, now nearly ended, has been attended with very varied success: some flocks having produced a greater fall of lambs than usual, whilst in many others the increase has been less than average years. The cold wet weather has been very injurious to the ewes, in reducing their condition more than at any former period, and many lambs have died from starvation and want of nourishment. The cattle and sheep markets have been scantily supplied, and fodder being plentiful, prices are good and the sales brisk. The wool trade has continued to improve, until very little remains in the hands of the graziers; from these causes, and the high price of meat, for those who have to purchase at this season to cover their marsh land, the prospect of profit in the ensuing summer wears but a sorry aspect, and the breeders, as for many years past, are again likely to realize the principal benefit. The corn trade, which had much improved since the last month, again flags, and wheat, which in our markets had got up to fifty shillings the quarter, has receded in some cases as much as five, and still looks downward. A good proportion of stacks appear in the farm yards, but the prospect of an average crop for next harvest seems extremely doubtful.—April 20.

WILTS.

After a long continuance of wet and storm, so that the arable land was not in a state to move without treading, it began to clear up on the 10th inst., since which time Spring sowing has done well. Some small quantity of barley was sown before this date, but, generally speaking, this was the time for beginning. Those who are unfortunate enough to have land to sow that is out of order, never could have an opportunity to effect anything like a clearing, and it must be sown in a bad state, or not at all. It has seldom been remembered that the working cattle have done so little in a time of the greatest importance to the farmer, from the middle of February to the second week in April; consequently, the Spring work is much behind. The "bushel of March dust" would have been very acceptable. The wheat is backward, and does not require to be fed off with sheep, and the plant good, except in a few spots, where it suffered from the wire-worm in the early part of

the winter. Winter vetches too are backward, but the frequent alternate frosts and thaws of the last season have not destroyed them. An attempt to introduce a new variety of oats as Spring food for sheep has been frustrated. The quantity of hay and turnips at this season has seldom been so small. A whole hay-rick is rarely to be met with, and water meadows are in great request. Many farmers who have been attempting to keep a larger stock on their farms to counteract the low price of wheat, will have reason to repent where they have much hay to purchase. The relative prices of sheep and wheat for the last few years have tended to promote this attempt, which the large extra consumption of hay during the past Winter will again check. The price of hay is from 25 to 50 per cent. higher than at this time last year, with a larger sale than has been known for many years. The breed of lambs is much complained of. From yearning time to the 10th of April they had scarcely a day without more or less rain, and frequently wind, snow, or hail. Some incurred diseases which they will never wholly overcome, and some died, more particularly on the 1st of April. The stock of wheat in the yards is great, but of other ricks, as hay, beans, &c., we never remember less at this season of the year. The poor laws are come into active operation through this county, and if we mistake not, the moral and political state of the poor will be eventually greatly bettered, and the rates reduced from one-third to (in some extraordinary cases) a half of the average of the last three years.—April 20.

#### SUFFOLK.

From the date of our last report to the end of March, but little progress was made with sowing Spring corn, and during the first twelve days of the present month the unfavourable weather we experienced also retarded the same. Since the 12th inst. however, the weather has been much more favourable, and the Lent corns are now generally put in, in tolerably workmanlike order; the wheats during March have first suffered, then recovered, then again suffered, and are now wearing a healthy verdant appearance, the causes for which were cold, wet, and changeable weather. The clover layers are promising, and Winter vetches are very flourishing. *Trifolium incarnatum* has been greatly injured by the frost and the cold wet weather we have had, and we fear there are but few pieces that will be fit to stand for a crop; however, they will produce a little feed for sheep, &c., which will be very acceptable, as stock are generally suffering, and have, during the Winter, suffered great privations from the loss or failure of the turnip crop. Hoggets and sheep have commanded unusually high prices, but during the last week the trade has become somewhat depressed; wool also is looking up; we have heard of 2s 3d per lb being offered for Down and Leicester hogget wool. Stock of every description is commanding much better prices, particularly hogs, which are invariably either "gold or brass," and although the corn market has received a temporary decline, we feel persuaded there has already dawned a brighter era for the farmer than it has been his lot to witness for many past years; we must also candidly admit the effect of the New Poor Law far surpasses what we expected it could possibly realize.—April 22.

#### KENT.

Since the last report, we have had some very ungenial weather for the growing crops, as well as to get in our Lent corn; so much rain and cold wea-

ther we have not experienced so late in the season for some years. The wheats have been much checked by it, but the loss of plant is by no means so much as was expected at one time, so that if we should now have warm weather, with a few intervening showers, we may yet see our fields well covered, except where they have been too long under water. The early sown Spring corn, in a very great number of instances, have a very sickly appearance; but the change of weather will no doubt do much to restore them to their usual colour. The finishing yet in our Spring crops this year has been a very tedious process, for when the land has been in a fit state, the rain put a stop to it sometimes for weeks, before we could commence again, and very often for several days, so that at this time some have not yet finished; the present appearances certainly are that we shall have a very backward Spring. The corn markets, no doubt governed much by the weather, have been rising; but, as before observed, it will benefit but few, as in many cases they have none to dispose of. In all our stock markets the supply has been very scanty, the butchers having to go many miles from their usual markets before they can get supplied, and only then if they give a greater price for their beef. The rise in sheep is considerable, and will no doubt continue till they lose their wool, which is now an article of very great consideration with the flock owners. The wool staplers are at the present moment buying all the wool they can, and at an advanced price, so that a number of holders of this article, who have kept it by them for years, and who have been induced to part with it, shows that the old stores will be mostly disposed of before the new comes into the market in any quantity.—April 21.

#### PERTSHIRE.

At this late period of the season sowing of spring seeds is just commencing, some few patches of beans were indeed got in near the end of February, but since that period the soil has uniformly been too moist for a seed bed. For many winters past the snow has not been so deep in the highlands as in the past month, and even last week it lay to the depth of fourteen inches in many places in the lower parts of the highlands, and from the variable and low state of the temperature the surface of the snow has become enervated, and as the lambing season had arrived, and the sheep returning from the moors in the low country, ploughs were employed on sheep walks to break the enervated surface of the snow in order to hasten its dissolution; the lambing season, under such circumstances, has hitherto been anything but favourable. The barley cultivated in this quarter under the name of Chevalier in nearly a fortnight later in ripening than common English barley, and requires to be sown early on dry bottoms. Some of this variety has been got in, but the greater part of beans on clay and retentive soils remain yet to be sown. The two past days having been fair, sowing of oats on open soils will this day commence with vigour, but a dense hard frost threatens another obstruction. The rapid alternations of sleet, rain, snow, frost, and high winds, with a generally low temperature, produced a sickly appearance in wheat-fields. On Tuesday the 5th inst. the temperature became something more elevated, and already the appearance of growing wheat is more favourable; in general farm labour and vegetation are two weeks later than usual at this period of the season. Clovers still plant close, and promise a fair hay crop. Italian rye grass is deservedly exciting notice; where the ground is partured the second year in alternate husbandry this is a most valuable

acquisition, producing a regular and rapid succession of green foliage so much liked by horses, sheep, and cattle, as to cause a regular cropping and prevention of running to seed of any of the other grasses which may be in the mixture. A third part of this excellent grass seed mixed with two-thirds of the ordinary varieties of rye grass, will considerably enhance the value of the succeeding hay crop on pasture. The untoward aspect of the weather produced a rise in the price, and a keen demand in the market for all sorts of grain. A considerable portion of wheat is still in the farmer's hand, but less of other sorts of grain. Potatoes are now getting scarce, and continue in request at from 13s to 15s per boll of 32 stones Amsterdam, or 17½ lbs to the stone. Cattle and horses have also experienced a rise in price in

the course of the past month. It is now fifteen years since some considerable landlords converted their money rents into rents payable by the annual average price of grain, and all such have had their rents generally well paid, without the tenant having to submit to the degradation of asking a reduction of rent which he had promised to pay. Where this salutary measure has not been adopted, either from ignorance or avarice, farmers have got into arrears, and some landlords, calculating on the full amount of their rent rolls, and living accordingly, have been at last obliged to pull in, re-value their land, reduce their establishment, and retire to some obscure quarter to recruit their finances by parsimonious living, reversing by such conduct first and last of the good old maxim of "Live and let live."—*April 11.*

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**LOCKERBY SHEEP SHOW, March 31.**—This Show, by the great interest it created among the feeders of sheep, attracted, notwithstanding the badness of the day, numbers of farmers from every part of Dumfriesshire, and a good many from Galloway and Cumberland.

The experimental premiums for the greatest increase of weight from the 15th May last, of Cheviot and half-bred year-old widders, were the first determined, the main object being to ascertain the comparative increase in weight of these two kinds of stock, as well as the profit to be derived from keeping them into the second year. The premiums were awarded to the farmers who should make the greatest increase in live weight in three of each kind, not giving more than half-a-crown's worth of grain.

The first premium was awarded to Mr. Smith, Ladyland, of Kirkbean, whose six sheep had each increased in weight, on the average in the 10 months, about ..... 85lbs.  
 The second to Mr. Richardson, Lammonby, whose sheep had gained about ..... 74lbs.  
 Other two lots were shown, one belonging to Mr. Laurie, Terregles-town, ..... 65lbs.  
 Another to Mr. Stewart, about ..... 56lbs.

The two last had been much heavier and fatter at the commencement of the trial.

The average increases of weight on each of the 12 Cheviot Sheep was ... 62lbs.  
 On the 12 cross-bred, each ..... 75lbs.  
 —lbs.  
 The average live weight of the cross-bred was ..... 212lbs.  
 of the Cheviot about ..... 162lbs.

From experiments made by killing some of them, it was ascertained that the cross-bred (23 months old) would be about 32lbs, a-quarter; the Cheviot 24lbs. to 25lbs.; and on a calculation of the profit of keeping the cross-breeds for these 10 months, the feeder would be paid, at 5½d a pound of mutton, about ..... £1 11 0

The Cheviot at 6d., about ..... 1 6 0  
 There was a good show of half-bred hogs.

The first premium for the best score was given to Mr. Laurie, Terregles-town—bred by Mr. Renwick, Park.

The second to Mr. Richardson, Lammonby—bred by Mr. Hetherington, Roberthill.

The third to Mr. Richardson, Dryfeholm—bred by ditto.

The show of Cheviot hogs was the best that had appeared.

The first premium was awarded to Mr. Bell, Broomhill—bred by Mr. Little, Pennyland.

The second to Mr. Bell, Brigmuir.

Several of Mr. Laurie's hogs reached 140lb., or nearly 20lb. per quarter; and the Cheviot up to 119lb., about 16lb. a-quarter of mutton.

A party of 40 or 50 of the principal farmers afterwards dined together, having on the table legs of mutton killed from the competing lots of Cheviot and cross-bred widders a week before, and thus had an opportunity of judging of the comparative quality as well as the weights of each kind of stock. After dinner the conversation was devoted entirely to the practical subject of improving the mode of feeding stock in the south-west of Scotland for the English markets. It was also agreed that the market should in future be held a week later, and that besides the usual premiums, there should be given some expressly to ascertain the comparative advantage of feeding extensively with grain.

A general show of fat cattle and sheep at Dumfries for the Liverpool markets once or twice a-year was suggested; and all the gentlemen present seemed anxious to encourage such an exhibition, thinking the country now prepared for it.

The sixth anniversary of **BOTLEY CATTLE MARKET** was numerously attended. The competition for the prizes was great, and the sheep shown by the Hon. Mr. Gage, of Westbury; Mr. Fielder, of Sparsholt; Mr. King, of Cocum; and other gentlemen, were much admired for their qualities. The show of lambs was also excellent, and they met a ready sale. The judges of the stock were Mr. Lanham, of Southampton; Mr. Monk, of Portsmouth; and Mr. Gale, of Mitcheldever, whose award gave entire satisfaction to all parties. The prizes were thus awarded:—

A cup, value 4l., to Mr. William Barfoot, of Chicken Hall Farm, for the best South Down Lambs.  
 A cream ewer, value 4l., to Mr. John Atkins, of Barton Farm, for the best Lambs of any breed.  
 A new one-wheel plough (given by Mr. Canning), to Mr. Jacob Gater, of Swathling, for the second best Lambs of any breed.  
 A soup ladle, value 4l., to Mr. Warner, of Steeple Court, for the best Wether Sheep.  
 A new grass seed machine (given by Mr. Fletcher), to Mr. James Warner, jun., of Curdridge, for the second best Wether Sheep.

A gravy spoon, value 2l., to Mr. Jacob Gater, of Swathling, for the best Ewes.

At the conclusion of the market about 60 of the principal dealers and gentlemen attending the market sat down to dinner, presided by Mr. Gale of the Dolphin Inn, at which Sir Raymond Jarvis presided, and, as usual, successfully exerted himself to promote conviviality and enjoyment.

**ROMSEY SECOND PRIZE MARKET.**—The show of stock, particularly sheep and lambs was excellent, and so numerous that the market place was thronged. Many dealers attended, and consequently the greater part of the stock changed owners. Mr. Twynam, of Whitechurch, although excluded by distance from contending for the prizes, exhibited some tegs of the Cotswold and Southdown cross, which were particularly admired from the immense size they had attained at the early age of 14 months, and from the quantity and quality of their wool. One of the sheep was shorn in the market, and the fleece weighed 12½ lbs. Mr. R. King of Barton Stacey, and late of Lee, near Romsey, also exhibited some Southdown wethers, which were considered perfect; and amongst the horned cattle, two heifers, belonging to Mr. Gater of Swathling, obtained universal commendation. The prizes were awarded as follows:—

Best fat ox . . . . .	£6	Mr. Lanham
Second best . . . . .	4	Sir Wm. Heathcote
Best fat heifer . . . .	5	Mr. Gater
Ten best wethers . . .	5	Mr. Rich. King, jun.
Second best . . . . .	3	Sir Wm. Heathcote
Ten best lambs . . . .	5	Mr. Lowman, Nursling.
Second best . . . . .	3	Mr. Gater
Best fat calf . . . . .	3	Mr. Green

**SHERBURN MONTHLY CATTLE MARKET.**—We had a very good supply of fat beasts this day, which sold readily at from 6s 9d to 7s per stone; fat sheep from 7d to 7½d per lb. Lean beasts fetched high prices, and straw-yard pigs (though not numerous) were readily sold. The attendance of buyers and dealers was numerous and respectable. Situated in the valley of the Derwent and Harford, at the foot of the Yorkshire Wolds, on the direct road between Scarborough and Malton (being only eleven miles from each place), this market is considered a superior outlet for the fat sheep stock, from the extensive sheep walks in its vicinity:—the fertile downs and grazing lands north of the Derwent and neighbourhood, almost always ensuring a supply of fat and lean cattle. The general use of bone manure upon the formerly barren districts of the Wolds, has caused a complete revolution in the system of husbandry there practised; and a good crop of turnips can now, almost with certainty, be procured in situations where, a few years ago, the agriculturist could barely obtain, even in the most favourable seasons, a scanty and inefficient supply, hence his sheep stock were either sold in the Autumn, or wintered in the neighbouring lowlands at an extra expense, and in situations detrimental to the well-being of his flock. From this improvement in agriculture, and the increased quantity of fat thereby produced for sale, the necessity of establishing this market became apparent, and the patronage so far bestowed upon it by dealers and others, has fully equalled the most sanguine expectations of its public spirited promoters.

At **SHREWSBURY FAIR** the supply of fat sheep was not equal to the demand, and the whole were readily sold at 8d per lb; some brought higher prices; (at recent sales around the town, flocks have been sold as high as 9½d to 10d per lb;) ewes and lambs sold readily and well: but very poor couples were not readily sold. The supply of cattle was good, and the breeders were firm in asking 7d per lb, but very few obtained that price; 6d per lb being the general run, and those who would not sell at that price took their cattle home: 10s a-head over 6d per lb was nearly the highest price. Fine outlying bullocks, half-meated or better, were in demand; one team of bullocks were sold for 28/ per head. Good cows and calves sold well: but poor barrens, owing to deficiency in keep, could scarcely be sold on any terms. Pigs were scarce, and from 2s to 4s a-head higher. The dairy fair was very brisk—cheese, of which the supply was not great, was rapidly sold; skims 45s to 50s per cwt; middle dairies 56s to 62s; best 68s to 70s. A few tubs of butter were exposed, but the season is not favourable for its sale. A moderate supply of bacon was offered, and sold at 6d to 6½d per lb, hams, 7d.

At **POOL (MONTGOMERYSHIRE) FAIR**—Prime fat sheep obtained nearly 8d per lb; pigs, of which there were few, sold at an advanced price. There were very few fat cattle, but they sold well: there was a large number of store cattle, but a small demand, in consequence of the want of grass, and the backwardness of the spring. Two droves of cattle from Merionethshire, in fresh condition, passed through Pool and Shrewsbury yesterday, on their way to Northamptonshire and Leicestershire.

At **ILSLEY SHEEP MARKET** a great supply was exhibited, and every description something cheaper. One parcel of tegs, without the wool brought 47s; the sum of 12s a head was refused for the wool. The quality of all descriptions was far better than was expected.

**ARDEE FAIR, (IRELAND).**—At this Fair the stock disposed of, dry cattle excepted, generally realised high prices. The fat cattle were of a superior quality. There was a large lot belonging to W. P. Ruxton, Esq. for which there were many bidders, and high prices offered. Two cows, the property of the same gentleman, were sold, one for 25 guineas, the other 22. The largest cow weighed over 10½ cwt: some of it was disposed of so high as 8d per lb. A beautiful two-year old bull, belonging to T. L. Norman, Esq. of Corballis, was exhibited, and 32/ demanded for it; it was not however sold. A fine lot of wedders belonging to G. Taffe, Esq. of Smarmor Castle, was sold at 3/ per head. Fat Pigs rated at about 30s per cwt.; slips and sucking pigs rather higher. There was a large show of dry cattle, but owing to the backwardness of grass and the dearth of fodder, few of them were purchased; such as were sold underwent a great depreciation. The horse fair was poorly attended, and such as were exhibited were of a very inferior sort. On the whole, a good deal of business was transacted, and cash to a considerable amount disbursed.

**DEVIZES GREEN FAIR** was well attended, and horned cattle and sheep sold briskly at good prices. Three fine fat beasts, exhibited by Mr. S. Ferris (a celebrated grazer of Bulkington) were sold to a gentleman of Oxfordshire for 100 guineas. It is a general observation throughout the country, that at no former period was there such a scarcity of fat sheep. Good mutton, therefore, obtains very high prices.

## TO THE EDITOR OF "THE FARMER'S MAGAZINE."

SIR,—In your number for February, a Subscriber wished to be informed of a remedy for Straining in Ewes after Lambing; now the one I should recommend is Cuff's Farmer's Friend, if given immediately after a difficult lambing; yet, as the prevention is easier than the cure, the ewes should have a small portion of linseed cake daily, for at least a fortnight before lambing, as I have found from experience ewes never lamb well that live entirely upon turnips. Straining often takes place in ewes two or three days after an apparently easy lambing, yet is brought on by a sudden change from turnips to seeds or grass; when that is the case, I have rarely ever seen any recovered. Linseed cake, besides preparing the ewe for a change in keep, gives a richness to the milk which nothing else can.

If, Mr. Editor, you consider these few remarks worthy a place in your valuable magazine, I have no doubt by a trial of the simple plan I have recommended, many of your readers at another lambing season will be of my opinion, that they had better give a part of their turnips away (if too many) than omit using a portion of linseed cake.

I am, Mr. Editor, yours, very respectfully,  
A YORKSHIRE FARMER.

April 22, 1836.

## REVIEW OF THE CORN TRADE DURING THE MONTH OF APRIL.

At the commencement of the past month, the prevalence of rainy, cold and ungenial weather, not only checked sowing and field labour, but prevented vegetation from evincing any progressive improvement. Low, strong lands were rendered unfit to receive the seed, and Wheats in many places exhibited a sickly appearance, turning partially yellow, and looking thin and unfavourably; the re-appearance, however, of sunshine, about the middle of the month, had an invigorating effect on the plant, which assumed a deep and healthy green, tillering out strong, and covering well the ground, while the farmer has been enabled nearly to conclude the sowing of his Lent corn. Vegetation and germination are extremely backward, but under the mild influence of the present month, the plants possess the full embryo power of rapidly advancing, and partially retrieving the time that their vegetative powers have remained dormant; affording little opportunity, from existing appearances, to enter into further speculative purchases, on the probable result of the crops; as there is reason to believe there is sufficient plant to produce a fair average per acre; but accounts seem to concur in stating, that the breadth of wheat sown this season is less than usual, particularly in the midland counties, which is attributable to the low price of wheat, and the failure of the turnip crop having prevented farmers breaking up land they otherwise would have done. No doubt the backwardness of the season has operated advantageously for the farmer, as it has been one of the causes of bringing the state of the trade under more general notice, added to the prosperous condition of almost every other branch of commerce; indeed it is a gratifying remark to make that our manufactures are in a state of almost unexampled activity—our mines, that important source of national wealth in full and profitable operation—our commerce busy, and consumption, the faithful index and concomitant of prosperity, going forward on a largely increased scale of all the necessaries and many of the comforts of life. With a productive harvest, grain may be now calculated at a fair value, but with an inferior or even a middling crop, prices are yet low and will be materially influenced by the weather.

The consumptive demand for cloverseed may be considered as closed for the season, and much disappointment has been experienced throughout the latter months, at the languid character of the market. Reports, after the gathering of the crop, represented the yield as extremely deficient, and little more than *one-fourth* of an average growth,

owing to the drought in the first cutting of the seed, and the unfavourable weather prevailing for securing the second. Extensive speculations were entered into in foreign seed, and prices rapidly advanced at all the markets abroad. The currencies however, since January, have continued to recede, and are now fully 15s per cwt lower than at the termination of December for English samples, and 15s to 20s for foreign. The supplies of English have been larger than anticipated, and the quality remarkably fine, and much of the demand has been drawn off from the London market, owing to the direct imports from Holland, Germany, &c., to different parts of England, Scotland, and Ireland; in fact to those places which have been accustomed to make their purchases in the metropolis. The foreign seed has been, for the most part inferior this season, particularly the French, Brabant, and Rhenish, owing to the continued drought; the American seed being the finest at present offering, and which is held at from 60s to 63s; extra fine, 65s. The only interest now existing, therefore, in the trade, is on speculation; and at low figures there are several purchasers ready to make investment.

The important assistance that mangel wurzel has proved as an article of feed, the past season, has induced an extended breadth of this valuable root to be cultivated; from Ireland also there has been an extra demand for seed, and latterly for France purchases have been making, which, as the stocks of seed were not large, have advanced the prices to 100s and 112s per cwt, with very little at present left on hand. The season is also extremely favourable for its sowing, as the seed generally *hits* well, if put into the ground, when thoroughly saturated with moisture.

During the early part of April the prevalence of rainy weather had the effect of enhancing the prices of wheat, and factors were enabled to realize an advance of 1s to 2s per qr, white wheat in runs obtaining 55s to 56s, fine parcels being worth 57s to 58s: red runs sold at 50s to 51s, fine 52s. The supplies, however, having proved rather liberal, exceeding on the aggregate those of the previous month by 6,000 qrs, and the weather becoming more favourable, prices again receded, and though early in the season for the market to be influenced by the *barometer*, yet each succeeding day has exemplified the fact, and though every advantage has been taken by holders of endeavouring to realise more money on the occurrence of a wet day or clouded atmosphere, yet the currencies have declined 3s to 4s, red wheat being noted at 47s to 48s; white 54s to 55s, with a

tendency in the trade further to give way, on the continuation of mild temperature, as supplies no doubt will increase with the addition of the samples which will be offered from granary by the purchasers in speculation; though we do not apprehend that fine red wheats will go lower at present than 45s, and white 50s.

The advices received in the early part of the month from New South Wales corroborating the previous dull accounts, checked further shipments of bonded wheat to that distant colony, and as the duration of Winter in the United States had prevented the various cargoes of wheat which had arrived from Europe, from being brought upon the market, the demand for bonded wheat relaxed, but as the stocks were much reduced, further orders were transmitted to Hamburg, and the lower and upper Baltic ports, for the purchase of the finer wheats, to be retained in granary, and await either an improvement in the foreign markets, or a decline in our duties; the advance, however, in the demands of foreign holders have prevented the execution of several orders. Danzig wheat in bond has been held at 35s. Mecklenburg, Holstein, and Upper Elbe qualities 28s, and though of late the accounts from New York, Philadelphia, Baltimore, and Boston, have stated various sales of European wheats at high prices, yet speculators are awaiting a more general result from their shipments and account sales, before increasing their consignments. The principal shipments of wheat have been 700 qrs to Quebec, about 600 qrs to Guernsey, 300 to Nova Scotia, 1,600 to Sydney, 500 to Cherbourg, 900 to the Mauritius, 1,100 to New York, and 300 to 400 to Baltimore.

The advance in wheat and steadiness in the prices, enabled millers to realise an improvement in flour, and town made qualities were first noted at 45s and then 48s per sack, which are still the nominal quotations, purchases very generally made at 45s to 46s, according to circumstances, and even less money is taken in some instances; the bakers only buy for their immediate wants, and the trade, therefore, rules dull; ship's flour participated in the advance, and 38s was readily realized for Norfolk householders; but prices, have now receded 1s to 2s; and the nominal top quotation of town made next week will most likely be 45s, and the selling prices, 42s to 43s; and ship's flour 33s to 34s. Bonded flour has been in request for shipment, but the stocks are extremely short, and though the few arrivals which have been received from the Elbe and Baltic have met ready purchasers, yet many orders are unexecuted from want of supply. Sour qualities realize 20s to 22s; sweet, 21s to 25s; during the month there have been exported about 2,300 cwts to the West Indies, 5000 cwts to Sydney, 300 to Luncheon, 400 to the Cape of Good Hope, 4000 to Pernambuco, 400 to the Mauritius, and 410 cwts to Cherbourg.

The averages have strongly exhibited the effects of the improvement in wheat throughout the kingdom. The aggregate average price of wheat has advanced from 42s 9d to 46s 1d, making the duty 4s lower, being now 40s 8d, and the London average of wheat has risen from 46s 3d to 52s. Other articles having previously maintained a higher relative value, were not of course susceptible of a proportionate enhancement; the aggregate average of barley exhibits a difference of only 1s 4d, having risen from 29s 3d to 30s 4d. Oats from 20s 10d to 21s 7d. Beans from 31s 9d to 35s

4d, and peas from 33s 9d to 35s 5d; the duties on the first articles have receded 1s 6d per qr. and 2s per qr on peas.

During the month of April the following quantities of grain and flour have arrived in the port of London:—

	Wheat.	Barley.	Malt.	Oats.
	qrs.	qrs.	qrs.	qrs.

Total in Jan...	8,514	6,584	16	35,507
Foreign in April	893	60	11,705 brls.	10,575

The arrivals of barley have been liberal, and exceed those of March by nearly 11,000 qrs. At the beginning of the month, the short supplies of barley, added to the unfavourable appearance of the weather for the seed already sown, and the period becoming protracted for the completion of sowing, caused a speculation, added to a consumptive demand for the article, and prices advanced 2s to 3s on the fine malting qualities, and 3s to 4s on distilling and grinding sorts; Chevalier having been noted at 38s to 39s, and extra, 40s. Norfolk and Suffolk malting at 35s, extra 36s; distilling 33s; fine stout 34s; grinding 30s to 31s. This advance in the prices and the improvement in the weather, brought forward increased supplies, and though the demand continued free, yet the additional receipts had the effect of checking the trade, and prices of all sorts gave way 1s per qr; the maltsters showing little disposition to get further into stock at present, as the malting season is approaching its close, unless the weather remains cool. Distillers' qualities, however, continue saleable, as well as grinding parcels, but it is to be apprehended, that supplies having been kept back, owing to the wet, we shall have soon an influx of the article, if sunshine prevails, and the present currencies, therefore, cannot be expected to be maintained except for the selected parcels of Chevalier for the ale brewers. Bonded barley is very scarce, and shippers have been unable to find parcels to meet their wants and a few hundred quarters only have been shipped to Oporto, and America. The whole stock in bond in London did not exceed 6,725 qrs on the 5th of April, and in the United Kingdom 41,368 qrs; and good qualities of Danish barley have freely obtained 18s. A few purchases have been made in Mecklenburg and Holstein, but prices are ruling too high to allow of any extensive transactions.

Malt, in consequence of the advance in barley, has obtained 2s to 3s per qr more money than at the close of March, and though the trade latterly has been languid, yet the improvement has been supported.

The supply of oats has exceeded that of the previous month by 45,197 qrs; the dealers and consumers had become extremely bare of stock, anticipating large supplies, and a consequent reduction in prices; but though the receipts have been considerable, yet purchasers have been found even at an advance of 1s to 2s per qr upon all descriptions of fresh feed; but Scotch potatoe having come freely to hand are rather cheaper, while the stale and inferior descriptions have been difficult of disposal, and sustained no improvement in value. Several sales have been effected of Irish oats free on board at advanced terms; good fresh oats of 40lbs to 42lbs have been taken at 11s 6d to 12s; and 10s 6d to 10s 9d for Galways, but the chief business transacting has been on the west and north-west coast. Oats in bond have been bought for export to the West Indies and United States of America. The shipments have comprised 1,900 qrs to Boston; 1,840 qrs to New York; 500 qrs to Baltimore; 1,150 to the Mauritius; 600 to Spain, and 900 to 1000 qrs to the West Indies, and 50 qrs to Nova Scotia. Russian oats are held at 12s to 14s; Danish and Swedish, 13s to 14s; Friesland, feed, 13s to 15s; brew 15s to 16s.

Beans have been in short supply, and the article meeting an improved demand, prices have augmented 3s to 4s per qr., at which enhancement they remain steady.

The demand for white peas has much increased, not only being taken, as before alluded to, for feeding lambs, but the best qualities have found purchasers on the part of millers, who are grinding up the article to mix with the more ordinary, and ill conditioned wheats; and in consequence sustained an improvement during the fore part of the month of 4s to 5s, but receded again before the close 1s to 2s, but were steady at this reduction. Grey and maple are also 1s to 2s higher, as well as Mazagan; for fine white Suffolk as high as 45s to 46s have been paid, but which are now worth only 44s.

In Canada the prices of wheat remained dull, and the grain market generally languid. Lower Canada red wheat was still held at 5s and 5s 6d per minot; barley had been sold at 3s; and oats at 1s 9d per bushel. Flour of superfine quality was nominal at 31s 3d to 32s 6d per barrel.

The merchants are complaining that, should an Act of Parliament be passed, authorizing the manufacture of bonded corn into flour for export, it would have a serious effect on the trade in Canada, as flour could then be exported from England to Halifax, or the West Indies, at a cheaper rate than from either Quebec or Montreal.

In France, the prices of wheat continue firm, and for flour there has been a partial demand at Paris, Etampes, &c., for inferior qualities to ship down the Loire to the Southern departments, principally to Cete, from whence it will be transported into Languedoc and Provence. From Bordeaux and the neighbouring district of the Garonne, as well as the Geronde farmers are complaining of the miserable appearance of the crops; the continued rains having weakened the wheat plant, and made it sickly. Rye was scarce, and the crop was not expected to produce more than half an average quantity; in fact from all the departments in the Southern portion of the kingdom, the reports are unfavourable as to the appearance of the young wheats. The sowing of oats is also in parts still prevented by the weather, and where Spring corn has been got in early, it has entirely failed in some places, and the ground ploughed again in order to

be resown. From Beauce, Brie, Picardy, and the Northern divisions of the country, much less apprehension however is entertained for the plant. The aggregate average price of wheat throughout France for the month of March, exhibits an improvement of 40 cents per hectolitre, or about 1s per qr, having been 15 francs 49 cents., or about 34s 9d per qr, while on the 29th of February, the rate was only 15 frs. 9 cents, or about 33s 9d. The aggregate for the last 17 years at the end of March has been about 40s per qr, the lowest price having been in 1822, when the average did not exceed 31s 4d, and the highest in 1832, having been 53s 8d. This improvement of 1s per qr, is in itself not very important; but the remarkable point is, the difference the classification of the average prices creates in the specified departments, as regards the admission of foreign wheat; thus at Marseille, Toulon, Cete, &c., the regulating average price is 17 francs 25 centimes, or about 40s 4d per qr; but foreign wheat cannot be admitted in that section under 12 francs 25 centimes per hectolitre, if imported in French vessels, or 13 francs 60 centimes in foreign; while the average of the second section of the fourth class is only 16 francs 47 cents, or about 37; and the duties imposed on the entrance of wheat at the ports of Cherbourg, St. Malo, St. Brieune, Morlaix, Brest, L'Orient, &c., including in fact, all parts from the department of Calvados and Cape Barfleur to the river Vilaine, in the Bay of Biscay, is only 4 francs 75 centimes, in French ships, or about 11s 2d per qr, or 6 francs per hectolitre in foreign bottoms, or about 13s 1d per qr. Thus the duties at those markets where the greatest demand is experienced, are still too high to admit of foreign imports; but at Cherbourg, Brest, Morlaix, and L'Orient, &c., the duties are 17s 9d per qr less than at Marseille, Toulon, &c., and therefore it is necessary, if exports are made from this country to the Mediterranean ports, for the vessels to be chartered with the agreement, that they touch at Cherbourg, or one of the above named ports, and having had their cargoes entered and paid duty, to proceed afterwards to Marseille.

At Algiers, wheat and flour in moderate quantities are likely to meet demand for the next four months.

Wheat in the Italian markets remains steady in price.

At Naples, some mills are being erected under the patronage of the Neapolitan Government, and the flour produced is entering into competition with that of the French millers, in the French African ports. The exclusion of the Barletta wheats at Marseille, has partly instigated their establishment. The trade had been momentarily affected by the failure of a house in the corn business. Barletta wheat however, for immediate delivery, was noted at 20s 6d, and at the end of April, at 23s 6d. At Trieste, Italian and Odessa wheat was worth 25s 6d to 30s 10d. At Leghorn and Genoa prices were unaltered.

Mild weather having continued to prevail in the United States of America, business had become more animated, and some progress had been made in clearing off the large quantities of European wheat, &c. which were afloat at New York, watching a market. 7,000 bushels of Russian wheat destined for Troy, had been sold at 47s 4d, including duties, expenses, freights, difference of measure, &c. Some fine white wheat had obtained 55s, 56s to 59s 4d; Danzig wheat, 55s; other parcels, 52s 10d. Russian and Prussian rye, 38s 11d. The barley from London realized only

60 cents., or about 22s. Some good oats from England had been sold at 29s 4d. Western Canal flour was advancing in price, and noted as high as 37s 8d to 38s 3d per barrel. At Philadelphia, wheat sold at 51s 4d to 53s; at Baltimore, 53s 2d to 54s 4d. At Boston, about 1,000 qrs of oats received from England had brought 22s per qr.

In South America restrictions had been imposed on the admission of flour; at Monte Video the duties had been advanced three dollars, and at Buenos Ayres, the import of the foreign article was prohibited from the 1st of January.

In the Russian markets prices of grain remained steady, but the quotations of Kubanka and Courland wheats ranged too high to admit of any orders being executed. Moschansky linseed was held at 43s to 43s 9d for August delivery. An Imperial Ukase had appeared in reference to the free admission previously granted, of grain into Esthland and the port of Narva, until the 13th of January, 1837, owing to the failure in the crops, but prohibiting its re-export from any port of the province, or the transmission by land to St. Petersburg, on penalty of forfeiture of the article. At Riga, Linseed has been enquired for, but sellers had withdrawn for the present from the market; crushing qualities were held at 39s 5d to 43s 3d, as in quality, and according to time of payment. Hempseed, 28s 3d to 28s 9d. Wheat was quoted at 22s 8d to 26s 3d for Courland descriptions. At Danzig the increased orders from England had caused additional animation in the trade; really fine white wheat had obtained as much as 35s per qr into granary; good mixed and ordinary high mixed, 29s; mixed descriptions, 27s; red mixed, and red sorts, of 60lbs, 24s; and some mixed Polish wheat, defective in colour, sold on delivery, at 29s per qr, free on board. Some parcels of high mixed wheat had been received from Elbing, which realized 30s to 31s, the colour good, as well as the quality, and the samples ranking as the best to be obtained from the last harvest; prices therefore, on the whole, must be considered 1s to 2s per qr higher. Several orders had been received for shipment, which was rather desirable, as warehouse room was becoming scarce, and should the bulk of wheat already bought, remain during the season, the rents would, no doubt, advance. Vegetation was very backward, but the farmers considered the circumstance rather favorable than otherwise. The Rape plant had a sickly appearance. At Stettin, wheat had advanced at 26s 6d, and become too high to admit of the further execution of orders at present. At Rostock and Wismar, also little business had been transacting since the last advices, owing to the orders being limited, lower than the prevailing currencies; the top quotations were 25s 6d; some oats had been bought at Rostock at 13s 6d; and barley at 16s 6d, and more orders were on hand, but the rates too high to admit of their execution. These remarks are also applicable to Holstein. At Hamburg the dull accounts from England has checked the advance in prices, and from 8000 to 10000 qrs. had already been bought for British account, yet most of the orders remaining on hand were limited too low for immediate execution. Upland red wheat was noted at 25s to 27s 6d per qr., but on the receipt of the Mail from hence of the 19th inst. holders were inclined to accede to a reduction of 1s to 1s 6d per qr. Linseed cakes were in request, and for delivery in July, as high as 7l to 7l 3s had been paid for Fleusburg quality, with a freight of 15s in full. At Rotterdam, purchases

of wheat had been made for America and Rio de Janeiro, and a little for English account; prices of Rhine in bond were 25s 8d to 26s 6d, and Danzig free, 35s 9d to 41s 7d. Linseed cakes in demand, and best qualities not to be obtained under 6l 3s 6d, and the stock very limited. Rape cakes 4l 16s.

**LIVERPOOL.**

WEEK ENDING APRIL 23.

ENGLISH WOOLS.—In this description of wools very little business has been doing. The stock in this district is limited. Prices will remain as at present until the beginning or middle of May, by which time the new clip will, probably, be in the market. Combing fleeces, 19½d to 20½d; Down ewes and wethers, 19d to 20d; ditto tegs, 21d to 22½d; super. skin, 18d to 19d; head ditto, 15d to 17d.

SCOTCH WOOL.—We have very few transactions to notice this week in Scotch Wools. A few sales of Cheviot have been made at full prices. Laid Highland is dull, and although the stock on hand is unusually small for the season of the year, we think sales would now be made rather in favour of the buyers. In Cross and White Highland we have not heard of any business.

	per stone of 24lbs.	
Laid Highland Wool, from 12s	9d to 13s	3d
White do. do . . . . .	16s	0d 16s 6d
Laid Crossed do. . . . .	16s	0d 17s 0d
Washed do. do . . . . .	17s	6d 18s 6d

White do. do . . . . .	32s	0d 34s 0d
Import for the week . . . . .	63 bags	
Previously this year . . . . .	2182 do.	

IRISH WOOLS have been very quiet since last week. There has been no reduction in prices, although holders are more disposed to give way than they were a few weeks ago. The market is not, upon the whole, so firm. The imports are 118 bags. Irish fleeces, mixed lots, 19d to 20d per lb; do. wethers, 18d to 19d; ditto hogs, 20½d to 22d; ditto combing skin, 17d to 18d; ditto short skin, 14½d to 17d. Import for the week, 118 bags; previously this year, 1,630 ditto.

FOREIGN WOOLS.—Some sales by auction have taken place during the week, which have commanded good prices. The greater part of the Peruvian offered for sale was withdrawn, only 20 bags out of 400 having met with purchasers. The sales of East India fared better, especially the inferior descriptions. There was a large attendance of buyers from the manufacturing districts. The annexed quotations were fully supported: Foreign—Odessa, fine, 2s to 3s 6d; Portugal R., 1s 5d to 1s 7d; Portugal, low marks, 1s 0½d to 1s 2½d; Spanish R, 2s 6d to 2s 9d; Spanish, F S, 2s 2d to 2s 4d; German fleeces, 2s 2d to 2s 6d; ditto assorted, 2s 6d to 2s 9d; ditto lambs, 2s 6d to 3s 6d; New South Wales, 2s 4d to 3s 0d; Russian wool, 8½d to 9½d; Buenos Ayres, 4d to 5½d; Mogadore and Barbary, 4½d to 6d. Import for the week, 194 bales; previously this year, 5,892 ditto.

**FOREIGN.**

APRIL 25.

Supplies, of Foreign Wools, have consisted, since this day se'nnight, of about 1,150 bales, principally from Germany and Turkey, with a few from the Cape of Good Hope. Last week's sales were well attended by buyers, and nearly the whole of the wool was sold, at about the prices obtained at the sales which preceded them. There are two additional sales, of 523 bags and 280 bales, of German, Dutch, Tuscan, Donskey, and Spanish Wools, appointed to take place at Garraway's, on the 27th and 28th inst.; making the total quantity to be offered for sale, next week, about 1,250 packages. Private contract demand is very steady, at fully stationary prices.

**BONES.**

Since our last there have passed the SOUND, or by ELSINORE, and the GREAT BELT, ships loaded with Bones, bound for Hull, 6; Grimby, 2; other parts of England, 8; Dumfries, 1; other parts of Scotland, 4; also loaded with Patent Mist or Manure, for Bridlington, 1; for Dundee, 1.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on both sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

### POOR LAWS—IRELAND.

(From the Chronicle.)

We lay before our readers a portion of a most important document—the “Third Report of the Commissioners for inquiring into the condition of the poorer classes in Ireland.”

The state of society in Ireland is so different from that in England and Scotland, that measures applicable to the latter may not always be suitable to the former. This is particularly the case with respect to the poor. The great body of the labouring class in Ireland look to agricultural employment alone for support, and the supply greatly exceeds the demand. In Great Britain the agricultural families constitute little more than one-fourth of the population. The cultivated land of Great Britain amounts to about 34,250,000 acres, and that of Ireland to about 14,600,000 acres; but in 1831 there were 1,131,715 agricultural labourers in Ireland, while there were only 1,055,982 in Britain, so that there are five agricultural labourers in Ireland for every two for the same quantity of land in Great Britain. The excess of the supply of labour beyond the demand accounts for the want of employment and the dreadful distress of the population.

The number of persons in Ireland out of work and in distress during thirty weeks of the year is estimated at 535,000, and these have 1,800,000 persons dependent on them, making in the whole 2,385,000, a frightful amount of pauperism.

A disease of such enormous magnitude obviously requires a peculiar treatment. In England the workhouse is the asylum for the aged and impotent poor, and it is not contemplated that the able-bodied poor should remain in it. From the reluctance of the latter to submit to the restraints of the workhouse, it is used as a means of putting them on their own resources, and forcing them to find out employment. But in Ireland there is no employment to be found; and were it possible to build workhouses for all who are destitute, and to induce the able-bodied to enter them, it would be impossible in the present state of the country to provide for such a multitude. On this point the Report states:—

“The expense of erecting and fitting up the necessary buildings would come to about 4,000,000*l.*, and allowing for the maintenance of each person, 2½*d.* only a day, that being the expense of the Mendicity Establishment of Dublin, and at other similar establishments in Ireland, the cost of supporting the whole 2,385,000 for thirty weeks annually would be something more than 5,000,000*l.* a year, whereas the gross rental of Ireland (exclusive of towns) is estimated at less than 10,000,000*l.* a year; the net income of the

landlords at less than 6,000,000*l.*; and the public revenue is only about 4,000,000*l.*”

The workhouse system of England not being suited to Ireland, the question is—how are the poor to be provided for?

Hitherto the course has been comparatively easy. But it is not so easy to devise satisfactory remedies for the evil.

Before we proceed to notice the suggestions of the Commissioners respecting the able-bodied poor, we shall advert to their proposals for the relief of the aged, impotent, and diseased.

“The institutions existing in Ireland (they say) for the relief of the poor, are houses of industry, infirmaries, fever hospitals, lunatic asylums, and dispensaries; the establishment of these, except as to lunatic asylums, is not compulsory, but dependent upon private subscriptions, or the will of grand juries; there are but nine houses of industry in the whole country; while the provision made for the sick poor, in some places, is extensive, it is in other places utterly inadequate; and there is no general provision made for the aged, the impotent, or the destitute.”

They propose that a legal provision should be made for the relief and support of incurable as well as curable lunatics, idiots, epileptic persons, cripples, deaf and dumb, and blind poor, and all who labour under permanent bodily infirmities, to be afforded within the walls of public institutions; also for the relief of the sick poor in hospitals, &c.; also for the purpose of emigration, for the support of penitentiaries, to which vagrants may be sent, and of deserted children; and also for the relief of aged and infirm persons, orphans, helpless widows with young children, the families of sick persons and casual destitution. They recommend the appointment of poor-law commissioners as in England, and assistant commissioners: that Ireland be divided into relief districts, and surveyed and valued; that there shall be a local board of guardians for each district, elected by the rate-payers; and that the board of guardians have the direction of all institutions for the relief of the poor supported by the local rate; and that the commissioners shall be authorised to assess a national rate upon the whole of Ireland, and to require the board of guardians of each district to raise a proportional share thereof.

With respect to emigration, it is proposed that one-half of the expense should be borne by the general funds of the empire, and the other half defrayed partly by the national rate, and partly by the owners of land from which the emigrants remove, or from which they may have been ejected within the preceding twelve months, the lessors who may have sublet to emigrants to be considered the landlords.

With respect to vagrancy, it is recommended that any person convicted of it, be transported for seven years; that penitentiaries be established, to which vagrants, when taken up, shall be sent.

With respect to the relief of the aged and infirm, orphans, widows, and children, and destitute persons in general, there is a difference of opinion among the commissioners. Some think the funds should be partly provided by a national rate and partly by private associations, which should be authorised to establish mendicity houses, &c., and to administer relief to the indigent at their own dwellings; while others think the whole of the funds should be provided by the public—one portion by a national rate and another by a local rate, and administered as in England by the board of guardians of each district.

The commissioners look to emigration and internal improvements as resources for the able-bodied poor. They recommend the appointment of a board with powers to carry into effect a comprehensive system of national improvement. There are 3,000,000 Irish or 5,000,000 English acres of reclaimable waste lands. The board of improvement to be armed with the most extensive powers, to meet the difficulties from the embarrassed state of property, &c., to appoint local commissioners. With respect to lands already in cultivation, as there is throughout Ireland an urgent necessity for drainage, the commissioners recommend that the provisions of Mr. More O'Ferrall's act, and the English sewer's act, may be modified, incorporated, and extended, so as to cause all lands to be kept duly drained and fenced under the direction of a competent authority. As the sum required may be such that it could not be raised at once by any rate either on landlords or occupiers, the commissioners recommend that the board may be authorised to advance the sum at once, making the rate redeemable by the proprietor; and if he omit to redeem, saleable by the board.

The commissioners recommend a number of improvements, which in the aggregate may be of importance. But space will not allow us to enter into the various details.

A great part of the resources on which the commissioners calculate are to be derived from the improvement of the waste lands, and the rates for the improvement of lands already under cultivation. With respect to the poor, properly so called, it is recommended that the board of guardians of each district shall frame an estimate of the sums required within the year, that the estimate shall be transmitted to the commissioners, who may vary or affirm it, and add to it the portion of the national rate which the district ought to bear; the commissioners shall then order the boards of guardians to levy a rate, one-third to be charged on the occupier of each house or tenement of land above the value of *5l.* in respect of the occupation, and the remaining two-thirds in respect of the beneficial interest therein; the whole to be payable, in the first instance, by the occupier, who shall be reprimed as to the two-thirds for the beneficial interests. Tenants at will to deduct the whole rate from the immediate landlord.

A rather bold course is recommended with respect to the charge for the poor. The gross land rental of Ireland amounts to less than 10,000,000*l.* Expenses and losses are taken at 10 per cent., and annuities and the interest of charges payable out of land at 3,000,000*l.*, leaving a net income of 6,000,000*l.* It is recommended that the incumbent should bear a perpetual share of the burden, the security of his investment being bound up with the productive mass of the land and the well-being of the inhabitants, and that a person paying any annual charge, shall be au-

thorised to deduct the same sum in the pound thereout that he pays to the poor-rate.

It is certain that means do not exist in Ireland at present for such a system of relief as exists in England. But the suppression of vagrancy, and the subjecting property to various charges for the poor, will in time restore Ireland to a more healthy state. It is well observed by the commissioners—

“That it is only of late years, and by slow degrees, that the English constitution has been allowed to diffuse itself through the mass of the people of Ireland. For nearly the whole of the last century they were governed by a code, the policy of which was to keep in poverty and ignorance, and which was perfect for its purpose.”

Without the able-bodied are removed or employed, there can be no peace in Ireland; and without peace, capital will never be embarked in Ireland. There is, as the commissioners observe, “a rising spirit of improvement; but it must be stimulated by sound legislation, or it cannot speedily relieve the country from the lingering effects of the evil system of former times.”

## THE FUNDHOLDERS.

(From the *Hereford Times*.)

Many persons, agriculturists in particular, believe that the fundholders do not bear a fair proportion of the burthen of taxation, and that they ought to be subjected to a direct tax; nay, there are those who would wipe out as with a sponge all national obligation to pay the fundholder both principal and interest, with as much *sans froid*, as a boy would expunge scribbling from his slate. This belief is founded upon a most erroneous opinion of the actual circumstances of funded property; for any additional indirect or direct tax upon the fundholder, which should not also be imposed upon any other species of property, would be as unjust, as would be the refusal to pay a just debt.

We are well aware that a considerably less sum than the nominal debt was really advanced as a loan to the nation; the system of bonuses, premiums, &c. was little better than a system of plunder. We are also aware that the real value of money in 1835 is much higher than it was in 1800, and that it will take a much larger amount of produce to discharge a debt of twenty shillings in 1835, than it would have taken in 1800. In reference to the first fact, it must be borne in mind that the funds are *transferable* property; and that the *ownerships* have changed hands, hundreds of times since the date of the loans. Therefore, to visit the present proprietors with any punishment for the sins of the governments of former days, and of the individual lenders, who in those days reaped a golden harvest, would be equally as cruel and unjust, as to punish the present multitude of proprietors of those ecclesiastical lands or other property, which were filched by the plunderers of the days of Henry VIII. and his immediate successors. Consequently, all such filching projects must be abandoned as visionary, at least, if the national character for honesty is not to be abandoned. In reference to the difference in the value of money at the present time, and the times in which the loans were made, the fact seems to be forgotten, that the income derivable from funded property has been repeatedly reduced; indeed, to us it appears unjust, to force the fundholder to take a reduced interest, unless every mortgagee be forced also; and a moment's reflection will draw an appalling picture of national confusion and misery, which would be con-

sequent on any national scheme of "equitable adjustment." But who are the fundholders? Another popular error is that the funds are in the hands of the Croesuses—the Rothschilds, the Barings, &c.; the truth, however, is widely at variance with this supposition. We learn from Parliamentary Returns, that the twenty-eight millions of interest on the public debt is divided among nearly THREE HUNDRED THOUSAND persons! Here is the return—

Not exceeding	£5 per annum	83,609 persons.
...	10	42,227
....	50	97,307
.....	100	26,306
.....	200	15,209
.....	300	4,912
.....	500	3,077
.....	1000	1,555
.....	2000	450

Now, who are these thousands of annuitants? Widows, orphans, the aged, and the infirm, almost all living upon small annuities in this country,—all their small properties have been earned by years of industry, and then vested in the hands of the nation, on the faith of that nation's integrity! "Think," says a popular writer, "of the consequence of extinguishing, or even abridging these petty incomes! What impoverishment and destitution it would create among widows, orphans, the aged, and infirm. How many funds destined for charitable uses, or for mutual assurance against misfortunes, and amassed with difficulty out of the earnings of the industrious, would be violated?" But we do not anticipate the perpetration of such an amount of crime, and, certainly, not by the hand of the British nation. Let us all sail in the same boat; tax property if you please, but do not tax only *one* species, more especially the property of the Savings' Bank Depository of Friendly Societies, of widows and orphans—in one word, do not legally filch the produce of by-gone industry.

## THE AGRICULTURAL AND COMMERCIAL BANK.

(From the Limerick Times.)

The peculiar opposition—an opposition, alike unnatural and unnatural, which the Agricultural and Commercial Bank met with at its outset, instead of retarding its progress, has, on the contrary, but accelerated its operations and expanded its usefulness even beyond the most sanguine expectations of its friends and founders; and, as it was designed to unite Irishmen of all classes and all creeds for the common good and general happiness of their country, so it has experienced the patriotic sympathy, and acquired the popular and moral strength of Ireland for the attainment of ends so necessary for the national interest. Not only the Peerage, but the Roman Catholic Prelates and Clergy, and the leading men of various shades of party, are amongst its firmest and most vivid supporters; and it has recently obtained the aid of the most affluent and influential men of that meritorious class of the community denominated Friends, who have heart, and hand, bound up their capital and character with its maintenance. The Agricultural and Commercial Bank has now twenty-six branches at work, diffusing the means of promoting industry—enlarging trade—encouraging safe speculation—and affording commercial facilities to large masses of the agricultural and trading population, who, until this Institution was put into action, never knew the value—enjoyed the convenience—felt the comfort—or could appreciate

the advantages of a widely spread and cheering system of banking.—Yes,—and we state the fact without desiring either to disparage or discountenance any other establishment—why should we? There is plenty of room and work enough for them all—and sincerely do we wish that they would all pull together—as well for their own ease as the public convenience; but we must nevertheless, from a sense of justice observe, that, until the liberal policy—sound system—and, above all, the truly national and patriotic principle of the founders of this Bank were brought out and practically displayed, the great bulk of the Irish people never experienced the full benefits of banking—and it, moreover, opened to every man in the country the simple, secure, and accessible means of elevating his condition. Who ever heard in this country the humble mechanic, the laborious farmer, the small shop-keeper, and scanty trader, proudly say that he was a holder of Bank Stock; aye, a Bank Proprietor! until the establishment of the Agricultural and Commercial Bank? And, let us ask, are there no moral influences associated with these things? Yes, indeed, there are,—and upon the wide foundations which have been laid by the good and honourable men who first planned this great work, myriads of Irishmen will yet build up fortunes and independence—and perpetuate the happiness of their families. Within the last week the wealthy families of Garratt, Pim, Beal, Danes, Ridgeway, and a host of rich members of the Society of Friends, have joined the Bank.

## STATE OF AGRICULTURE.

(From the Liverpool Times.)

The agricultural committees of both houses of Parliament have been sitting for some time, and examining witnesses from all parts of the kingdom, though from the manner in which they are constituted, the evidence taken has not been published. Amongst the witnesses examined have been Mr. Sandars, Mr. David Hodgson, and Mr. Scott, of Liverpool, and we have reason to believe that both Mr. Sandars, and Mr. Hodgson's evidence are considered very valuable by the committee. The members will probably sit for some months longer, though the evidence already taken is pretty decisive as to most of the questions of any importance brought or likely to be brought before them. If we are not much misinformed, the gentlemen with one idea, and that idea a wrong one about the currency, have so far gained nothing by the inquiry. They have succeeded in showing that the monetary revolution produced by Peel's bill was a very ruinous one, but that is what every knew before, and they have also succeeded in showing that the landed interest suffered as much as any other interest from the change, which no man in his senses will deny; but they have not shown that a second monetary revolution will remedy the evils of the first, or that to unsettle the currency is even a probable means of benefiting any one. In short, they have failed in every thing that they attempted to prove, except in those matters which were freely admitted without any proof. They are now in a glorious minority in the committees of both Houses, and the public may rely on it, that whatever change may result from the report of either committee, no change in the currency will be recommended by either. Another point already pretty clearly established is, that the amount and extent of agricultural distress has been greatly exaggerated. It has been shown that, except as far as wheat is concerned, there is no

pretence to talk of distress at all, since wool, meal, hay, straw, barley, oats, milk, cheese, and butter, are all selling at very good prices throughout the country. As for wheat, it is also rising in price, and there is every reason to believe that now that wheat growers have begun to understand the cause of their own distress, which is that they have produced more than the market required, or the demand could take off, this will also be set to rights. The most intelligent witnesses examined before the House expressed a very strong opinion that the growth of wheat had decreased to such a point as to render a fair and remunerating price all but certain during the present year. More than this the landlords and farmers cannot reasonably ask.—We understand that there is a very strong feeling in favour of a fixed duty on foreign grain, in the place of the present graduated and fluctuating scale, amongst several members of the committee, though it is not very likely that any change will be made at present.

#### SIR R. PEEL.—WHAT ARE THE CHANCES OF THE TORIES?

(From the *Old Bell's Messenger*.)

Another cause is, that the agricultural interest begin to regard him as adverse to their views, and as retaining a kind of paternal preference for the interests of the commercial and manufacturing classes, as distinguished from those of the farmer and landlord. Here, we think the feeling against him is unjustly directed; he possesses a very large landed property, and therefore must have a common interest with the other great landlords of the kingdom. Be the fact how it may, there can be no doubt that this opinion of his being adverse to the agricultural interest has very greatly damaged him in public estimation, and has concurred, amongst other causes, to diminish the numerical strength of his party.

Under these circumstances we shall find no difficulty in giving a very brief answer to the question, What are the chances of the Tories? Briefly, we say, none at all, unless, indeed, they make common cause with the farmers and landlords.

AGRICULTURE.—The following is an extract from a speech of Mr. Grey at the dinner which took place at the late meeting of the Union Agricultural Society.

Mr. Grey rose and said he was not sure if he was just now in his proper position, but as the Marquis of Tweeddale was not present, and as he had the honour to sit opposite to his Lordship (the Chairman) he understood that it was his duty to rise, but of this he was not certain, and was perhaps stepping out of the way, and if so the company, he trusted, would excuse him. He did not mean to say that he was overpowered, as is usual with persons who have their healths drunk and are unable to return thanks; but he would say, what he considered best became him, that he begged to return his sincere thanks for the honour that had been done him. He could not have experienced a greater pleasure than to have his health drunk by the present company, among whom he discovered the faces of many who had so long been his kind neighbours and friends, and who, though he could not now call them his neighbours he might still number amongst his friends. The show of stock which had taken place that day was such, as had been already mentioned, as could not have been exhibited in any other part of the world. There

was another source of gratification which he had enjoyed on the present occasion, and that was the improvement which had taken place in the quality of the stock. He said that he had lately had the honour of being examined before the Committee of the House of Lords on Agricultural Distress, and they, knowing that he had some acquaintance with the state of agriculture on the north side of the Tweed, asked him as to the state of this country, and he stated that the depression in Scotland was not so great as in the other parts of the empire. They asked how that had happened? He answered, it was not, perhaps, for him to say, but he conjectured, and he had heard it stated, that it might arise from the superior sagacity of his friends on the Scottish side of the Border, who had the shrewdness to establish and retain a superior system of banking, by which they were enabled to prosecute and carry out those improvements which they would not otherwise have been able to avail themselves of. He said also that they had adopted a better rotation of cropping, for while the corn-growing districts in England were suffering severely, the agriculturists in the more northern parts of the kingdom had by a mixed mode of cultivation, by combining grazing with tillage, escaped a portion of the distress which prevailed elsewhere. He begged again to express his most sincere thanks for the honour done him, and sat down amidst great cheering.

#### TO THE EDITOR OF THE MARK LANE EXPRESS.

In none of the English Agricultural Reports is the growth of Flax alluded to, from which I conclude that it either has not claimed the attention of the English farmer, or is not deemed worth his attention. This, however, is not the case in Ireland, where a very large breadth of land has been displaced from Wheat, and sown with Flax, which is found to pay a great deal better. My Correspondents say, "the quantity of land under Flax in the northern counties has in a few years increased from 30,000 to 100,000 acres, and next year will be at least 120,000, having paid the farmer better than any other produce. This Flax is in great favour with the English and Scotch spinners, and is to become a large trade." It may be supposed that an article which pays the *Irish Farmer* better than Wheat, would answer a similar good purpose with the *English Farmer*, and at the same time lessen the redundancy of the latter which has so depressed prices,

I remain, &c.,

W. C.

#### AN EXAMPLE NOT WORTHY OF IMITATION.

As in every instance which falls within our knowledge we delight in giving publicity to acts of kindness and consideration on the part of landlords towards their *tenants*, so do we deem it our duty to make known the names of those who are so "wicked," as Mr. Cayley would call it, as to be guilty of such conduct as is related in the subjoined passage from the *Brighton Guardian*. We abstain from farther observations at present, because we entertain some doubt of the correctness of the statement, and sincerely hope it will be contradicted.

"The Earl of ASHBURNHAM and Lady WEBSTER have severally warned their tenants to quit, or pay a heavy advance of rent, in consequence of the reduction of their poor-rates."

## TURF INTELLIGENCE.

It is not long since we introduced to the notice of our readers an occurrence which received the suspiciously mysterious appellation of "The Delicate Investigation in Ireland;" a case in which well-founded doubts arose as to all being *on the square*, while the sequel tended very much to justify previous suspicion, inasmuch as Mr. Ruthven refused to submit to that fair and honourable test proposed by the Irish Jockey Club, thus affording the strongest reason to believe that Caroline and Leinster, were merely *soubriquets* for Becassine and Old Bill; that they ran and won their races at a year younger than their real age, and consequently sought to obtain the prize surreptitiously. Mr. Osbaldeston appeared prominently, if not directly, in the affair; and we expressed our regret at the time that this gentleman (an old acquaintance) should be brought before the public in a form so unsightly. Prior to this period, something unpleasant had arisen at the last Heaton Park Races, where it was supposed Mr. Osbaldeston's horse (Rush) had been restrained from winning one race in order to procure bets against him in a second, which, however, he won with ease; in this instance manifesting powers much superior to those which he had previously exhibited. Thus Lord George Bentinck lost a bet to Mr. Osbaldeston; and on his Lordship being called on to pay at the Newmarket Craven Meeting he made some very pointed allusions to "the delicate investigation," and expressed his unqualified conviction of *unfair play* in the Rush transaction at Heaton Park. In consequence, a hostile meeting took place between the parties just mentioned at Wormwood Scrubs, on Wednesday, April, 13; shots were ineffectively exchanged, when the seconds (like men of good sense) would allow the business to proceed no farther. However, the duel has not dissipated the cloud which envelopes either the one or the other transaction.

Since the publication of our preceding Number, two highly important Meetings have taken place, namely, the Craven and First Spring Meeting at Newmarket; they are important not merely on account of the acknowledged celebrity of the place, but also as tending to throw that sort of light on the three great ensuing events in the racing world, the Derby, the Oaks, and the Doncaster St. Leger, so as to enable the book men to speculate more confidently. The Craven Meeting exhibited four of the Derby horses as winners; as will be seen by the appended list. Brother to Nell Gwynne won his race with great ease; that he is a good horse no person can doubt, but in this case he had "nothing to beat."

Muezzin and Taishteer won their races, and nothing more could be expected; while Ebberston, hitherto in the dark, came out in very good form, and obtained success very cleverly—so cleverly indeed that though he had not before appeared in the betting for the Derby, he now entered the list and was placed in an exalted position, which he has since steadily maintained. Generally speaking, however, the horses which came out at this meeting were below the general average sample of Newmarket; and the running, on the whole, less interesting than usual.

At the First Spring Meeting several excellent and highly interesting races were run, and much heavy betting took place on several of the events, particularly on the Two Thousand Guineas Stakes.

If, however, the events of the Craven Meeting threw but little light on the Derby or the Oaks, the proceedings of the First Spring Meeting have added only triflingly to our stock of knowledge of those prospective and highly important stakes.

Brother to Nell Gwynne, who some time ago displaced The Mummy from his exalted station on the betting list for the Derby, had continued the uniform favourite for the Two Thousand Guineas Stake, and on the previous evening, as well as at the moment of starting, the odds were decidedly in his favour; at the same time, Lord Lichfield's Elis, who had excited but little attention previously, found staunch supporters at a price only a mere trifle below the favourite: the race proved how accurately the powers of these two horses had been estimated. The odds, prior to starting, stood thus:—

5 to 4 agst Brother	10 to 1 agst Calmuc
7 — 4 — Elis	12 — 1 — Whaley
6 — 1 — Muezzin	20 — 1 — Ld. Berner's colt.

Nothing is more unpleasant (or indeed more unnecessary) than false starts; yet, so it happened, that the competitors for this great stake did not get away till after several recalls. At length, off they went: Elis, determined to try the stamina of his competitors, took the lead at the very top of his rate, closely followed by the Lamplighter colt and Brother to Nell Gwynne, the other three well up, and thus they came to the end of the T. Y. C. where the latter found the pace too much for them. At the bushes the Lamplighter colt lost ground, while Brother to Nell Gwynne endeavoured to reach Elis, who continued to lead at a tremendous pace. At length, Brother to Nell Gwynne collared his antagonist, the latter looking like a winner. Nothing could be finer or more interesting, than the admirably contested struggle up the rise, which was at length so finely finished that neither the one jockey nor the other

was conscious of the manner in which the race had terminated. It was decided in favour of Brother to Nell Gwynne.

The *false starts* again. The circumstance of *several false starts* taking place where there are only six competitors, and all of them above two years old, is an unpardonable circumstance; if it arise from incapacity in the starter, it is a manifest proof that he ought to be displaced. We are very well aware that jockeys are a very cunning, wary class of beings, ever ready to take advantage of whatever may have a tendency to promote the object they have in view, at the expense of their rivals or competitors: thus, when a jock, mounted upon an easy-tempered sluggish horse, is aware that one of his opponents has to manage a nag of a different disposition, but possessing superior powers;—a fretful horse, for instance, which possesses superior speed; he will be anxious for *several false starts*, well aware that the horse he most dreads thus becomes beaten before they are fairly away: we have witnessed much of this fraudulent manœuvring, which, however, ought to be prevented by the starter, as his authority is almost absolute, if he has capacity sufficient to exercise it aright. On no occasion, therefore, ought more than one false start to be allowed, however numerous the field; unless, as we have repeatedly before observed, in case of two-year olds. Amidst the rage for reform, we would propose a reformation of the matters of which we have been speaking: we would make it a *sine quâ non* that the horses should go at the second start, if not at the first (unless in case of two-year olds); another indispensable condition should be, to disqualify any jockey from riding who carried a betting book, as well as to make the exhibition of such a suspicious emblem, an incontrovertible plea for the suspension or discharge of either Judge or Clerk of the Course.

Next to the Two Thousand Guineas Stake, the Portland Handicap formed the most prominent object of attraction; while it may be justly remarked, that, if the powers of the candidates for the former had been accurately estimated, particularly in regard to the two favorites, the book men had not been equally fortunate in their calculation of the nags which appeared for the latter. However, this race confirmed what we have before asserted, that though Pelops possesses speed, no dependence can be placed upon him: he cannot bear to be collared; he must have it all his own way, or he will do nothing; the moment he is called upon, he shuts up.

If we are to form an opinion from the public displays which have taken place, as well as from what has been tolerably well ascertained, there is no reason to expect another Plenipo, or a second Queen of Trumps, amongst the nominations for the three great stakes, the Derby, the Oaks, and the St. Leger, or indeed amongst the three-year olds, some of whom do not appear for the important prizes we have just mentioned. We speak particularly as to the three-year olds; because, in the first place, the leading stakes, not merely at Epsom and Doncaster, but

generally throughout the kingdom, have been formed expressly for colts and fillies which have attained their third year; and secondly, because at an earlier period it is difficult to form an accurate opinion of the future powers or character of the animal: for instance, Moss Rose, (sister to Velocipede) proved herself a first-rate two-year old, but was not worth a button afterwards. Sir George Pigot's Chester Billy ran away from all his competitors when a two-year old, and there ended his short successful career; he scarcely won a race afterwards, and indeed, could seldom be induced to try. However, as far as relates to such very superior racers as those which we have mentioned above, they may be said to make their appearance only once in an age; when, like brilliant comets, they shine with refulgent lustre, and thus exhibit the perfection of their species.

By the time the present number reaches our distant readers, Chester Races will have commenced, and, we trust, a few days of fine dry weather will precede or usher in this highly respectable and elegant Meeting, or the odds will be much in favour of those powerful nags which can get well through "a deep country," as the Course, from the quantity of rain which has deluged the country during the months of March and April cannot be otherwise than heavy, particularly that part of it which forms the margin of the river Dee. We consider Chester Race Course as the prettiest and the most picturesque in the kingdom; very grateful, on the whole, to the feet of the racer—a circumstance, be it recollected, not a little in its favour. Jupiter and Red Rover are the decided favourites for the Chester Cup; the former having the call in the town of Manchester—from the circumstance, perhaps, of his owner (Mr. T. Johnson) residing in that wonderful and densely-populated emporium. Sir John Gerard's Billings has crept much into favour of late; he went well through our late long and dreary winter, and is in as fine condition as possible.

The Newmarket Second Spring Meeting commences on the 3rd inst., and will therefore take place the same week as Chester: this, however, amounts to nothing, as the distance of the places, and the opposite character of the Meetings, entirely prevents any injurious influence being exercised by the one upon the other.

While the Chester Trade Cup has excited much attention amongst provincial book-men, it seems strange that little or nothing has been transacted on the similar prize at Liverpool. General Chasse is the favourite in public estimation, but not with us. He has proved himself a very good racer, he has been eminently successful upon the Liverpool Course, it has formed the scene or the theatre of his unassailed glory, and he will therefore go more willingly over it than over any other ground; yet, when it is duly considered that the General, like his Dutch namesake, has seen much service, that after his splendid achievements last year at Liverpool, he ran very unsuccessfully at Doncaster—when these influential circumstances are gravely taken into consideration, the odds must be greatly against him on the ensuing occasion. That Queen of Trumps did not appear in the list for the Liverpool Cup would seem strange; but we have little doubt there was a very satisfactory reason for the omission: Was she, or is she, *all right before?*

[Vol. IV.]

## THE PLATE.

We are indebted to the Proprietors of "The Sportsman" for the Plate prefixed to this number, of which an able description will be found at page 427.

### MODE AND EFFECT OF EMPLOYING BONE MANURE.

BY C. W. JOHNSON.

I proceed to notice the effects and modes of applying bones as a fertilizer, either whole, broken, or in the state of powder.

The Doncaster Agricultural Association long since paid considerable attention to the use of bones as a manure, and they have made a very valuable report, to which I have before alluded, of the result of their enquiries, in which they say:—

"The returns received by the association, satisfactorily establish the great value of bones as a manure; our correspondents, with only two exceptions, all concur in stating them to be a highly valuable manure, and on light soils superior to farm-yard dung, and other manures.

"In copying the language of one of them in reference to dry sandy soils, we express the opinions repeated in a far greater number.

"I consider bone tillage one of the most useful manures, which has ever been discovered for the farmer's benefit. The lightness of carriage—its suitability for the drill, and its general fertilizing properties, render it peculiarly valuable in those parts where distance from towns renders it impossible to procure manures of a heavier and more bulky description."

For as stated by another farmer, "the carting of six, eight, or ten loads per acre, is no trifling expense. The use of bones diminishes labour at a season of the year when time is of the first importance; for one waggon load, or 120 bushels of small drill bone dust, is equal to forty or fifty loads of fold manure. Upon very thin sand land, its value is not to be estimated, it not only is found to benefit the particular crop to which it is applied, but extends through the whole course of crops."

The report adds, that bones have been found highly beneficial on the limestone soils, near Doncaster; on peaty soils, and on light loams; but on heavy soils, and on clay, they produce no benefit.

The mode of applying them is, either sowing by broadcast, or by the drill, either by themselves, or previously mixed with earth and fermented. Bones which have been thus fermented, are decidedly superior to those which have not done so.

The quantity applied per acre is about twenty-five bushels of bone dust, and forty bushels of large broken bones. The dust is best for immediate profit; the broken half-inch bones for more continued improvement. Mr. Birks says, "if I were to till for early profit, I would use bones powdered as small as saw-dust. If I wished to keep my land in good heart, I would use principally half-inch bones, and in breaking these, I should prefer some remaining considerably larger."

The reason for this is very obvious; the larger

the pieces of bone, the more gradually will a given bulk dissolve in the soil.

Such is the result of the application of bones in Yorkshire. In Middlesex, the practice is scarcely different, as will be seen by the answers to some questions I received from a very intelligent correspondent, Mr. John Rayner, of Uxbridge, in November, 1833.

I. On what description of soil is bone dust employed with the greatest advantage? On light dry soils.

II. The quantity per acre? From twenty to twenty-five bushels.

III. How long has its good effects been observed to last? This question requires a more lengthened reply. The good effects of bones as a manure, have been acknowledged by many agriculturists for a number years; but as farmers, generally speaking, are men who are not fond of trouble, and as there was great difficulty in breaking bones in sufficiently small pieces, to prevent dogs, &c. from running away with them, we can only in a few instances trace out their good effect. There is a farmer in the neighbourhood of Watford, who dressed his land with *whole bones*, some twenty years since, (at a period when you could obtain them from London for fetching) and he declares, that to this day, to use his own expression, "the land has never forgotten them." Although the first season or so he found but little benefit; this I attribute to the bones being so large, the ground could not so soon act upon them. The *bone dust* is supposed to last but one season; the larger sizes of half-inch and inch, are supposed two or three years, and are always seen to most advantage after the first season.

IV. What is the expense? The dust is 2s 3d per bushel—the half-inch, 2s—the inch, 1s 9d.

V. What is the season, and on what crops is it generally applied? The turnip season—Bone manure shows itself to more advantage on this crop than on any other—it is drilled with a drill made on purpose, with the turnip seed; the period is from May to July. Bone dust is also used with great advantage on grass lands sown broadcast.

In the valuable and long continued experiments of Mr. Robert Turner, of Tring, in Hertfordshire, the use of bone manure has been most decidedly successful.

The soil on which these experiments were made, hitherto a common, producing only farze, is sandy, with a substrata of clay, and then chalk. He began the use of bone manure in 1831, on *this land*, and has continued its employment for the last four years on a very bold scale, and with unvaried success. The quantity generally applied was from 24 to 30 bushels per acre, of the description of half-inch and dust, and the bones were invariably applied to the turnip crop.

The bones are drilled with the seed, at a distance of 18 inches; and the turnips are always horse-hoed.

The year 1831 was a very good season for this crop generally. The turnips manured with dust, like most others in the district, were very luxuriant. About 2,000 bushels of bone manure being this year employed by Mr. Turner.

In 1832, the turnips were in general a very bad plant, the fly committing general devastation. Many cultivators in the neighbourhood of Tring, unsuccessfully sowed four or five times.

On the turnip land of Mr. Turner, 74 acres were manured with bones. The effect, with the exception of the very last sown four acres, was again most excellent; the crop being very heavy, and that too on land now first cultivated; and there was in no case any necessity to repeat the sowing. The turnips were a much better crop than in 1831.

In 1833, the turnip crops in the neighbourhood of Tring, were a very partial crop.

On the farm of Mr. Turner, about 50 acres were manured with bones. The effect, with the exception of some of the last sown turnips, was very satisfactory; the crop very heavy.

These experiments the cultivator will deem of the very first importance; the soil was not manured with any other fertilizer, except bones; and in drilling, every now and then, for the drill's breadth, the bones were omitted.

On these breadths of land not boned, the failure of the turnips was general and complete: they vegetated it is true, and came up, but they were wretchedly small and of no use whatever.

The turnips being fed off, and the sheep folded on the soil, without any distinction being made between boned and unboned land, the comparative experiments upon the succeeding crop were rendered uncertain.

In 1834, Mr. Turner boned about eighty acres of turnips with the best success, and with the exception of some destroyed by the wire-worm, had a very excellent crop.

In 1835, on nearly an equal extent of land, notwithstanding the extreme dryness of the season, Mr. Turner had again on his turnips manured with bones, a very excellent plant, and never did this crop promise better than this season, on the lands of Tring.

The caterpillars which devastated the chalk districts of England, did not however omit this parish, their ravages were dreadful and complete.

And had not Mr. Turner made a most successful attack upon them by a detachment of 650 ducks, procured especially for this purpose, who devoured the black caterpillars with great voracity, his turnip crop would have been utterly destroyed. By their industry, however, twenty-five acres of turnips were cleared of the vermin, and saved from destruction.

At another farm, held by the same gentleman, at Ellesboro, by the assistance of the same ducks, who were transported there in carts, for that express purpose, he saved about eight or nine acres of turnips from the caterpillars: so that there is no doubt of the importance of the services rendered by these birds. He informs me that he found it necessary to give them a quantity of corn while they were thus employed in clearing the turnips.

The soil of the Ellesboro farm, on which the bones were tried for the first time in 1835, with complete success, is called White Land, and was in a very poor state of cultivation. The experiment was entirely successful, and the turnips promised to be very good indeed; those that were saved from the caterpillars, being for the season very excellent.

This soil, called white by the farmers, is probably a mixture of clay and sand; it becomes very dry

and loose in dry weather, but is described as "sticky" in wet periods.

Mr. Turner possesses a capital bone mill, worked by four horses, in which he crushes all the bones employed in his farm. He pays for the coarse bones 2*l.* 15*s.* per ton, and fetches them 15 miles: a ton of bones producing of half-inch and dust about 30 to 34 bushels of bone manure.

The cost of the mill, with the substantial shed which covers the machinery, horse-path, &c. was about 300*l.*, and it has been rendered available by Mr. Turner for several other purposes, such as chaff-cutting, thrashing, &c., by which the aggregate expense is materially lessened, and a very considerable annual saving effected.

For the last two years Mr. Turner has drilled with his crushed bones, an equal quantity per acre, of sheep dung, collected for the express purpose, at an expense of 2½*d.* per bushel, paid to the collectors: this he prepares in the winter, by laying the bone-dust in alternate layers with the sheep dung, and suffering them to remain fermenting some months until the turnip sowing. By this plan, by the fermentation of the mass, the two manures are thoroughly incorporated; and he considers that 35 bushels of the mixture, are fully equal in effect to 25 bushels of the bones. So that, allowing 3*s.* 6*d.* per acre for the expense of collecting the sheep dung, there will be a clear saving of 12*s.* 6*d.* per acre in bones, valuing these at 2*s.* per bushel.

The mixed bones and sheep dung is invariably drilled in with the turnip seed.

The practical farmer will hardly need any better testimony of the important value of crushed bones, than these extensive and long continued experiments of Mr. Turner.

They are not open to the common objection to experimental attempts, that they are carried on in far too limited a manner, and for much too short a period, to enable the cultivator to form from them a satisfactory conclusion; for he has annually manured with them scores of acres of turnip land, and that too in seasons which have afforded him, from the adverse prices of agricultural produce, but little encouragement to lay out money on any fertilizer of a doubtful value.

I earnestly, therefore, commend these important experiments to the attention of the practical farmer, as being fraught with information of the most interesting nature, especially to those who have to contend with the poor, light, upland soils: lands which are now with difficulty retained in cultivation.

In the year 1831, on a thin, chalky soil, in the neighbourhood of Amesbury, in Wiltshire, Mr. Devenish employed bone manure of the quality called "fine," drilled at the rate of twenty-four bushels per acre, with the turnip seed, on a portion of a field of about ten acres.

Part of the same field was manured with spit dung, at the rate of about 20 tons per acre, and another portion of the same field remained without any manure.

The Swedish turnips produced on the boned soil, were of four times the value of those grown upon the land manured with spit manure. Those grown on the soil without any manure, were deemed scarcely worth hoeing.

Bone manure presents to the cottager or cultivator of small plots of poor ground, as under the allotment system, a ready and cheap mode of permanently improving his land.

It would be well, perhaps, in some instances, if the managers under such an excellent system, were to apply the manure for the holder, and that too, if

they even thought it necessary in consequence, to add to the amount of the rent.

As a manure for plantations of trees, I am not aware of any experiments with bones: I should however strongly recommend their use for ornamental plots, but in a roughly broken state. A considerable quantity of phosphate of lime is contained in all timber trees. There is no manure of a mixed animal and vegetable nature, which remains so long in the soil as bones.

As a manure for flower roots, the turnings and chippings of bones the refuse of the Birmingham cutlers, have long been employed with the best results by my friend Maund, of Bromsgrove, the talented author of "The Botanic Garden."

Not only does he find their use increase the luxuriance of the plant, and the beauty of its colours, but there is in the application of this powder an elegance and cleanliness which cannot fail of recommending its introduction into the flower garden, and the conservatory.

Such have been some of the successful uses to which bones have been employed. The turnip crop has been the more generally experimented upon from the general difficulty of finding for this invaluable crop a sufficient supply of manure.

And with regard to other crops, the care and labour required for trying with sufficient accuracy a comparative agricultural experiment, must account for many discordant statements. Upon grass lands, however, it has been employed with very general success; but for the turnip, on poor light soils, it seems of the greatest and most undoubted value. It not only promotes the luxuriance of the plant, but there is a very great probability that the gaseous matters evolved by the crushed and putrifying bone, and the vigour it imparts to the crop, afford the young turnip plants very considerable protection from the ravages of the fly; at least many farmers consider this as one of its valuable properties.

The complete manner in which the roots of the young turnips envelope the pieces of crushed bone with which they are drilled, shews the attractive nature of this manure, and how nourishing it is to the turnip.

I cannot conclude these observations without professing my readiness to assist in any experiments, and answer any questions which may promote a cause now proceeding so successfully. The consumption of bones has already rendered it necessary to import them from foreign countries; and it yet remains to be proved, whether the fossil phosphate of lime will not be nearly as powerful a fertilizer as the crushed or powdered bones usually employed.

**GENERAL DIRECTIONS.**—The crushed bones have been invariably found more immediately beneficial as a fertilizer, when suffered to remain previously for some weeks, mixed with earth in heaps, exposed to the action of the atmosphere. By being thus fermented and dissolved, they are necessarily more speedily serviceable as food to the plants to which they are applied; and this observation more especially relates to the oats, barley, and other spring corn, since these do not remain on the ground for so long a period as other agricultural crops. The proportion is 50 bushels of bones, with five loads of earth or clay; or 40 bushels to five loads of common dung.

For wheat and pasture lands the previous fermentation of the bones is, for this reason, not so essential to the production of immediate benefit.

It is impossible to give any general directions for the quantity of bones to be applied per acre, since

soil, situation, and climate, must all be taken into the farmer's consideration.

The following facts, however, have been ascertained by numerous experiments, at some of which I have personally assisted.

1. That crushed bones remain in the soil, for a length of time proportionate to the size of the pieces; the dust producing the most immediate effect, the larger pieces continuing to shew the longest advantage. On arable land their good effects continue for four years; on pasture land for eight.

2. On turnips, oats, barley, and wheat, the quantity applied has been from 25 to 30 bushels per acre; on pasture land, from 25 to 40 bushels of bone *dust*, early in the spring.

3. The best mode of application is by the drill, with the seed corn.

4. The bones should, when first used, be always applied for the sake of correct information, in varying quantities per acre; and on no account should the farmer omit to leave, by way of comparison, a fair portion of the field without any manure.

## REPORTS.

### PREMIUMS FOR EXPERIMENTAL FEEDING.

#### No. I.

*East Fortune, March 21, 1836.*

SIR,—In compliance with the request contained in your note of the 16th inst., I send you the following Report of a Comparative Experiment in Feeding Cattle conducted by me in competition for the premium offered by the East-Lothian Agricultural Society.

The Committee of Management having approved of the scheme submitted to them, as required by the conditions contained in their advertisement, the cattle experimented upon, were, on the 17th October last, chosen from my winter fattening stock, and divided into four lots, each lot consisting of seven oxen, by the Sub-Committee appointed to superintend experiments of this kind.

The cattle are of the common breed of the counties of Durham and Northumberland,—are at present four years old,—and have been fed in the following manner:—

Lot 1 has been fed on turnips alone, getting as many as the cattle could consume.

Lot 2 has had potatoes at the rate of about 3½ lbs per day for each ox, besides as many turnips as they could eat.

Lot 3 has had, along with an unlimited quantity of turnips, an allowance to each ox, of 5 lbs Linseed cake per day; and

Lot 4 has been fed on draff and dreg from Linton Grain Distillery, and latterly a mixture of peas and oats, coarsely ground, has been given with the draff.

An account has been kept of the number of carts of turnips given to each lot, and a cart-load occasionally weighed, in order that the whole quantities consumed might be approximated to with sufficient accuracy;—the whole of the other food has been weighed or measured.

The experiment commenced on the 19th October last, and from that date to this, a period of twenty-two weeks, the quantities of food that the four lots have severally consumed, are as follows:—

Lot 1, Fed on Turnips alone, has consumed	
36 tons white globe, at 6s per ton	£10 16 0
27 ditto Dale's Hybrid, at 7s do.	9 9 0
33 ditto Swedish, at 9s ditto	14 17 0
	£35 2 0

This is at the rate of about 4s 7d per week for each ox.

*Lot 2, Fed on Turnips and Potatoes.*

22 tons white globe, at 6s per ton	£6 12 0
17 ditto Dale's Hybrid, at 7s do.	5 19 0
19 ditto Swedish, at 9s ditto	8 11 0
16½ ditto Potatoes, at 43s ditto	24 7 6
	£45 9 6

This is at the rate of about 5s 7d per week for each ox.

*Lot 3, Fed on Turnips and Linseed Cake.*

35 tons white globe, at 6s per ton	£10 10 0
25 ditto Dale's Hybrid, at 7s do.	8 15 0
33 ditto Swedish, at 9s ditto	14 17 0
45½ ct. linseed cake, at 7s 9d p. ct.	17 12 ½
	£51 14 7½

This is at the rate of about 6s 8½d per week for each ox.

*Lot 4, Fed on Distillery Grains, &c.*

115 qrs. draff, at 4s per qr.	£23 0 0
83 puncheons dreg, at 2s per pun of 125 imp. gallons	8 6 0
4 qrs peas coarsely ground, at 28s per qr.	5 12 0
1½ qrs Oats do. do., at 20s do.	1 10 0
16 bushels Salt, cost price	1 1 3
	£39 9 3

This is at the rate of about 5s 1½d per week for each ox.

As the cattle are to be exhibited at Haddington on the 1st April, and there inspected and valued by judges appointed by the Committee of Management, I shall not insert any comparative estimate of the weight or value of the separate lots; I cannot give their exact measurement, as several of the cattle will not allow it to be taken.

Regarding the quality of the different kinds of food, I may state,—That the white globe and Dale's Hybrid turnips, were grown on dry gravelly soil of good quality, the manure a mixture of bones and rape cakes; they were sown rather late, were of small size, and very firm and juicy. The Swedish turnips grew on a more clayey soil, of very good quality,—were matured with farm-yard dung and bones, and when lifted, the smaller roots were kept out. All the three varieties were excellent of their kind; and, if it be considered that there is nothing deducted from the price of the oil cake and other rich food, on account of the very superior quality, as well as increased quantity, of the manure which they produce, I conceive that the rates of value adopted for the turnips, will not be thought too high.

The potatoes given to lot 2, were of the variety called dons, and of a quality that would be considered good in any season;—I mention this because, although cattle, when they have a choice, prefer the larger and coarser varieties, these contain a much less proportion of nutritive matter than the table sorts.

The linseed cake employed, was of the best Dutch, and probably not much inferior to English-made cake. For the most profitable employment of this expensive food, the present experiment has been continued too long; for even admitting that the cattle fed on it have increased in weight of beef considerably more during the last half of the time, than they did during the first, yet as their beef, at the end of the first three months, would have brought about the highest price in the market, the food since consumed by them, it appears to me, might have been more profitably used in feeding another such lot; for in this way twice the number of lean carcasses would have been converted into valuable beef.

Finding that the lot on distillery offal were making

very little improvement, I began, in the beginning of February, to give them some meal mixed with their draff; before this, when the draff was new and sweet, they did very well; but as it grew stale, they ate gradually less and less of it, and more straw, with which, in common with the three other lots, they were always liberally supplied; since that time, by increasing the quantity of meal with the draff became sour, the mixture is always eaten with relish, and the cattle have been improving very rapidly. The expense of feeding, also, is at the same time greatly increasing; the meal, at the rate they have been allowed it, costing for each ox, fully 3s per week, given at a smaller daily rate, continued during a longer period, the same quantity of meal would probably have produced a better effect; but from what I have observed while conducting this experiment, I am convinced that if distillery offal, at its present price, can in any way be profitably used in years when not more than ordinary profit on feeding is obtained, it must be by giving along with it some other better food.

Trusting that these notes contain all necessary information.—I am, &c. A. BRODIE.

To Mr. George Dods, Secretary, U.E.L.A.S.

The following is the valuation put upon the several lots by the Judges—viz.,

Lot. 1, Valued at	£21 10s each.
2, Do.	22 10 do.
3, Do.	25 0 do.
4, Do.	21 0 do.

No. II.

*Lawhead, March 24, 1836.*

DEAR SIR,—After receiving your letter of the 18th October, I was induced to prosecute the experiment which I had previously signified my wish to conduct, in the hope of its leading to some beneficial result. The object sought for, was to ascertain whether beans, potatoes, and turnips, raised in equal proportions, upon certain kinds of soil, might not be made available in feeding cattle, as successfully and extensively as could be done by the same extent of land being put exclusively to a crop of turnips for the like purpose.

With an intention of throwing some light upon this subject, two members of your Sub-Committee proceeded, with the assistance of Mr. John Hutchison, to separate twelve queys, and eight steers, into four lots of five each, three queys and two steers in each lot. They were marked, numbered, and tied to the stake that day, and by the 25th October the several lots were put to their allowance, fewer potatoes being given the first fortnight, as a matter of precaution. Before this time I had arranged matters, taken up, weighed, and stored for the lot of five cattle,—

No. 1. Three and a half imperial acres of Swedish turnips, weight per acre, 14 tons, 3 cwt, say in all 49½ tons. This I calculated would afford 134 lbs daily to each beast, up to the time of their removal.

No. 2. For this lot I stored one and three quarters acres of turnips, and one and three quarters of potatoes, which weighed 12 tons per acre, so that the allowance for the five cattle, in all, was 24¾ tons of turnips, and 21 tons of potatoes, yielding 67 lbs of turnips, and 56 lbs of potatoes per day to each animal.

No. 3. For this lot I stored one and three quarters acres of turnips, 24¾ tons produce; and set apart also the produce of one and three quarters acres of peas and beans, which I imagined might produce 8 bolls per acre; but the crop at this period not being in a condition to be thrashed

or ground, I borrowed 4 bolls of old beans, which were afterwards repaid, upon the supposition of 8 bolls. However, I proceeded to serve out daily for each beast of this lot, 67 lbs of turnips, and 4 lbs of meal. The bean crop being now thrashed, it was found to yield 16½ bolls, in place of 14, I therefore, on the 1st of January, increased the daily allowance from 4 to 6 lbs.

No. 4. For this lot I stored one and three quarters acres of potatoes, produce 21 tons; and one and three quarters of peas and beans, 16½ bolls. Here, as in the case of No. 3, four bolls of old beans were borrowed, so that at first the daily allowance for each beast was 56 lbs of potatoes, and 4 lbs of meal, the quantity of meal being increased to 6 lbs, the same as No. 3. I may farther mention, that each beast of this lot only, was allowed daily, about 10 Scotch pints of water, and straw in common with the three other lots, which got no water.

Thus managed, the cattle will be exhibited on the show ground at Haddington, when the judges will determine the result of this experiment. By a few days' close attendance in the out-set, I was enabled to guard against mistakes in the after-management. The turnips, potatoes, and beans, having been measured off, one acre of the turnips, and another of the potatoes, were taken up from different spaces of seven drills, each as directed by the gentlemen of the sub-committee.

The produce of 14 imperial acres of land having been thus apportioned for the 20 cattle, each 5 being to consume the produce of 3½ acres, which was separately and distinctly set apart for them. Having seen this correctly done, the keeper was allowed to proceed in his own way; as I foresaw that in the end the remainder (if any of the produce should remain,) would testify concerning the relative value of turnips, potatoes, and beans per acre, when converted into beef; this being the main object sought for in such an experiment.—I am, &c.

ANDREW HOWDEN.

TO THE EDITOR.

SIR,—I have been surprised by reading for several weeks back such flattering accounts of the sheep flocks in the south, with such favourable reports of their lambing, particularly as I see accounts in the same week of the severity and changeableness of the weather, which till lately appears to have been much more severe in the south, though not more variable than it has been here. But stern winter, though he seemed to be taking a tour of his southern dominions in the earlier part of his reign, has yet convinced his subjects of the north by his late notice that they have lost no part of his regards. The flocks of sheep in the direction of Shap Fells, Keswick, &c. were, till within these ten days, completely locked up by snow, for two or three weeks at the end of March and beginning of the present month, and the losses have consequently been enormous. One farmer I can mention from my own knowledge, had taken upwards of 600 ewe skins to Kendal a month since, and expected to loose at least as many more when the grass got to growing freely. Another, a smaller farmer, had purchased a small stock of between 60 and 70 sheep in the autumn, and a short time since he informed he had but two left, and they were both "poaked." It is an universal complaint here that there are many "failing" (rotten) sheep in all breeding flocks of fell sheep; and amongst what are here called "kind" (Leicester) sheep, very few lambs have been got out. I consider myself very fortunate in this respect, in having got out near 80 from 100 ewes. In hogs (hoggets) I have heard of nobody who has come off better than myself, and I have lost about 40 out of 200. I attribute my good fortune to having had plenty of very good hay, and having been very liberal of it, and good house room and turnips from my breeding ewes. The average loss to the best of my knowledge among hogs will be about one in three; of ewes it is impossible to form any idea. The falls of snow have been the deepest in the districts of the breeding flocks of fell sheep. My own observation extends only along the line of demarkation between the fell breed and the "kind breed," and the loss has fallen upon the lambs. How they have come off in Scotland I have not heard, but I doubt not that there, as well as here, will be severely verified their Shepherd's adage,

"Many frost and many thow,  
Macks mony weary rotten yowe."

At the fairs which have been held in this neighbourhood lately, as at Jedburgh on the 20th, and Penrith on the 25th, cattle went off very briskly, especially calves and gelt cattle, at prices at least 25 per cent. higher than in the autumn. I shall say nothing with regard to our corn markets; we are buyers generally. The tithe is our greatest annoyance. Our poor rates are not very heavy, about 8 or 10 per cent. and Mr. Voules, the commissioner, promises to reduce this burden considerably. Our highway rate, too, is very galling, as we have both the burden of making our roads good for the manufacturer, and obliged to pay a toll for using them ourselves.—Yours, &c., X. Y.  
April 28.

P.S. May 1st.—We have had three very hard frosty mornings, one of them harder than any during the winter. Kendal fair, 29th ult. was well attended, and, considering the state of the weather, the better end of the cattle were very ready sale; others were not so ready as at late fairs.

The following table contains a statement of the quantity of soluble or nutritive matters existing in varieties of the different substances which are used as articles of food, either for man or cattle. The analysis are principally those of Sir Humphrey Davy, conducted with a view to a knowledge of the general nature and quantity of their properties.

TABLE OF THE QUANTITIES OF SOLUBLE OR NUTRITIVE MATTERS AFFORDED BY 1,000 PARTS OF DIFFERENT VEGETABLE SUBSTANCES.

All these substances were submitted to experiments, green and in their natural states, and it may be here recapitulated that starch or coagulated mucilage forms the greatest part of the seeds and grains used for food, combined with gluten, oil, or albuminous matter; in corn, in union with gluten; in peas and beans, with albuminous matter; and in rapeseed, hempseed and linseed with oils.

and all the different specimens of North American

wheat which have been examined, contain rather more gluten than the British. In general the wheat of warm climates abounds more in gluten, and in soluble parts; and it is of greater specific gravity, harder, and more difficult to grind. In the South of Europe hard or thin skinned wheat is in higher estimation than soft or thick skinned; the reason of which is obvious, from the larger quantity of gluten and nutritive matter it contains, and it is therefore more peculiarly fitted for making *macaroni*, and other preparations of flour, in which a glutinous quality is considered as an excellence. In England the difficulty of grinding thin skinned wheat is an objection, but the difficulty appears to be easily overcome by moistening the grain, as intimated by the consul-general at Lisbon, in answer to some questions transmitted to him on the subject; he states, that in order to grind hard corn with the mill-stones used in England, the wheat must be well screened, then sprinkled with water at the miller's discretion, and laid in heaps and frequently turned and thoroughly mixed, which will soften the husk, so as to make it separate from the flour in grinding, and of course give the flour a brighter colour; otherwise the flinty quality of the wheat and the thinness of the skin, will prevent its separation, and will render the flour unfit for making into bread; the consul was informed by a miller of considerable experience, and who worked his mills with the stones from England or Ireland, that he frequently prepared the hard Barbary wheat by immersing it in water in close wicker baskets, and spreading it thinly on the floor to dry; much depending on the judgment and skill of the miller in preparing the corn for the mill, according to its relative quality; not that the weight in the flour of hard corn is increased by this process of wetting, but from its natural quality it imbibes considerably more water in making it into bread. The mill-stones must not be cut too deep, but the furrows very fine, and picked in the usual way. The mills should work with less velocity in grinding hard corn, than with soft, and set to work at first with soft corn, till the mill ceases to work well, and then the hard corn can be put on. Hard wheat always sells at a higher price in the foreign market than soft wheat, on an average of 10 to 15 per cent; as it produces more flour in proportion and less bran than the soft corn. The flour of hard wheat is in general superior to that made from soft; and there is no difference in the process of making them into bread; but the flour from hard wheat will imbibe and retain more water in making into bread, and will consequently produce more weight of bread; it is the practice in Portugal, and which it is advised to adopt in England, to make bread with flour of hard and soft wheat, which by being mixed, makes much better bread.

It is to be implied that the excellence of the different articles, as food, will be found to be in great measure proportioned to the quantities of soluble or nutritive matters they afford; albuminous or glutinous matters having the characters of animal substances, differing from the other vegetable products by containing azote; sugar is more nourishing and extractive matter less nourishing, than any other principles composed of carbon hydrogen, and oxygen. Gum and sugar excluding the different proportions of water they may contain, afford nearly the same elements by analysis, and starch differs from them only in containing a little more carbon; in conclusion of this cursory review, it may be remarked, that certain combinations of these various substances may be more nutritive than others; for instance, Sir Joseph Banks remarks, that the Derbyshire miners

in winter prefer oat cakes to wheaten bread, finding that this kind of nourishment enables them to support their strength, and perform their labour better. In summer they say, oat cakes heat them, and they then consume the finest wheaten bread they can procure. Even the skin of the kernel of oats probably, has a nourishing power, and is rendered partly soluble in the stomach with the starch and gluten. In most countries of Europe, except Britain and in Arabia, horses are fed with corn of different kinds, mixed with chopped straw; and the chopped straw seems to act the same part as the husk of the oat. In the mill, 14lbs. of good wheat yield on an average, 13lbs of flour; the same quantity of barley 12lbs, and of oats only 8lbs.

Total per Cwt.....	0	18	8

As regards the Beet-Root Company now advertised you may remark, that a few years past it was tried by some quakers in Essex, who were abolitionists, wishing to abolish Negro-labour, and the sugar retailed in Bishopsgate-street at the lowest rates to admit of profit, which were 8d per lb, and the article possessing much less saccharine matter than the produce of the cane, required nearly one-third more to give the sweetness of the West India sugars. All the ladies "were up in arms," imprecating the beet-root sugar, as having used it for preserves and wines in the same quantity as the West India sugar, had found their sweets sour. In the Indies sugar can be made and brought to this country materially cheaper than extracted from beet-root, either in this country or France, but the excise laws prevent its being retailed to the consumer at 3d per lb, which it might be, in order to secure the West India interest. The sugar, unless refined, tastes of the root.

SUCCESSION OF CROPS.

As crops of the cultivated plants succeed to each other upon the same ground, a question to be determined is the order in which the different kinds should follow each other.

All plants which are cultivated, and which are carried from the ground where they are produced, tend to render the soil less productive, or, in the language of farmers, to exhaust it.

But plants which are suffered to decay, or which are consumed by animals on the ground on which they grow, do not exhaust the soil. On the contrary, the decay of the stems and leaves of such plants, either naturally, or by the consuming of them by animals, tends to add those decomposing organic matters to the soil which form one of the elements of its fertility. This process may be imperceptible and slow, but it is that which Nature herself employs to form the soil, as distinguished from what has been termed the subsoil.

Sometimes this process of decay is counteracted by the singular natural provision, of a conversion of the decomposing vegetables into a substance which itself resists decomposition—peat. But, with this exception, the tendency of the decay of vegetables upon the surface is to add to the fertile matters of the soil.

This is well understood in the practice of agriculturists. When the productive powers of a soil have been exhausted by cultivation and the carrying away of its produce from the surface, it is laid down to herbage, in which state the future vegetation which it produces tends, by its decomposition upon the surface to renovate the productive powers of the soil. Land in this state is said to rest.

When land, however, has been impoverished by successive crops, and has become full of weeds, the laying it down to rest in that state is attended with less beneficial consequences than when the soil has been previously cleaned of injurious weeds, and fertilized by good culture. In the former case, the process of renovation is slow, if perceptible at all; the useless plants increase, and not those which are beneficial and afford food to pasturing animals. Land, when properly laid down to grass, therefore, tends to recover its wasted powers of production. Land not properly laid down has less of this healing property, and may be more full of weeds, and no richer when ploughed up again after a time, than when first laid down. Under good management, however, the laying down of cultivated land to grass and other herbage-plants to be consumed upon the ground, is a means of resting the soil, and renovating its powers of production; and this mode of recruiting an exhausted soil being always at the command of the farmer, its application is important in practice. It is to be observed also, that the poorer soils require this species of rest and renovation more than those which are naturally productive.

The experience of husbandmen from the earliest times has shown, that the same kinds of plants cannot be advantageously cultivated in continued succession. The same or similar species tend to grow feebly, or degenerate, or become more subject to diseases, when cultivated successively upon the same ground; and hence the rule which forms the basis of a system of regular alternation of crops is, that plants of the same or similar species shall not be cultivated in immediate succession; and further, the same rule has been thus far extended, that the same species shall recur at as distant intervals of the course as circumstances will allow.

All herbaceous plants whose produce is carried off

the ground which produces them, may be said to exhaust the soil upon which they grow. But all such plants do not exhaust the soil in the same degree; for after some species the soil is seen to be more impoverished than after others.

And not only do different species of plants exhaust the soil in a greater or less degree than others, but the same species does so according to the different period of its growth at which the plant is removed from the ground.

When a herbaceous plant is suffered to mature its seeds, it exhausts the soil more than when it is removed before its seeds are matured. All herbaceous plants, therefore, when cut in their green state, that is, before they have matured their seeds, exhaust the soil less than when they remain until they have ripened their seeds. Thus the turnip, when used in its green state, is one of the least exhausting in the agricultural class of plants to which it belongs; but the turnip, when allowed to remain upon the ground until it has ripened its seeds, is one of the most exhausting plants that is cultivated amongst us; and so it is with the rape and others.

Further, certain plants, by the larger or smaller quantity of manure which the consumption of them affords, are more or less useful in maintaining the fertility of the farm.

When a herbaceous plant is suffered to mature its seeds, and when any part of these seeds is carried off the farm, the plant affords, when consumed by animals, a smaller return of manure to the farm than if the same plant had been cut down before it had matured its seeds, and been in that state consumed by animals. Thus it is with the turnip plant referred to. This plant is with us sown before midsummer. In the first season it forms a napiform root, and puts forth a large system of leaves. Early in the following season it puts forth a long stem, which bears flowers, and the seeds are generally matured about midsummer. If this plant is removed in the first stage of its growth, that is, after it has put forth its large leaves and formed its bulb, and is then consumed by animals, it returns a great quantity of manure; but if it remains until the second state of its growth, then the consumption of its stems and leaves returns scarce any manure. The juices of the root have apparently been exhausted in affording nutrition to the flower-stem, the flowers, and the seeds.

It is beyond a question, that, in order to bring a plant to its entire maturity, by the perfecting of its seeds, a larger quantity of the nutritive matter of the soil is sucked up by it than when it is brought only to its less advanced stages. When crops of plants, therefore, are suffered to arrive at maturity, they are greatly more exhausters of the soil on which they grow than when they are cut down while they are green; and if those seeds are in whole or in part carried off the farm, the crops are exhausters of the farm, as well as of the ground which had produced them. Were the ripened seeds to be wholly returned to the soil, it may be believed that they might give back to it all the nutritive matter which had been derived from it. But, in practice, seeds are employed for many purposes, and are generally carried off the farm which produces them. When this is done in whole or in part, the plants produced are in an eminent degree exhausters of the farm, as well as of the soil on which they have grown.

Further, certain plants, from their mode of growth and cultivation, are more favourable to the growth of weeds than other plants. The cereal grasses, from growing closely together, and not admitting, or admitting partially, the eradication of weeds, are more

favourable to the growth and multiplication of weeds than such plants as the turnip and the potato, which are grown at a considerable distance from each other, and admit of tillage during their growth, and whose broad systems of leaves tend to repress the growth of stranger plants.

Having these principles in view, certain rules may be deduced from them, for the order in which the crops of plants in cultivation in a country shall succeed to each other on the same ground.

1st, Crops consisting of plants of the same or similar species shall not follow in succession, but shall return at as distant intervals as the case will allow.

2d, Crops consisting of plants whose mode of growth or cultivation tends to the production of weeds, shall not follow in succession.

3d, Crops whose culture admits of the destruction of weeds, shall be cultivated when we cultivate plants which favour the production of weeds. And further, crops whose consumption returns to the soil, a sufficient quantity of manure, shall be cultivated at intervals sufficient to maintain or increase the fertility of the farm.

And, 4th, when land is to be laid to grass, this shall be done when the soil is fertile and clean.

These rules may be applied to the plants which form the subject of common cultivation in the fields. In this country, the plants chiefly cultivated on the large scale are,—the cereal grasses, chiefly for the farina of their seeds; certain leguminous plants, as the bean and the pea; plants cultivated for their fibres, as the flax and hemp; for their leaves, roots, or tubers, as the turnip, the cabbage, and the potato; and certain leguminous and other plants for forage or herbage. The plants of these different classes are yet to be described; and they are now only referred to with relation to the order in which they may succeed to each other in cultivation.

The 1st class of these plants consists of the cereal grasses. These are chiefly wheat, barley, oats, and partially rye. All these plants are in an eminent degree exhausters of the farm. They are all suffered to mature their seeds, and are wholly or partially carried away from the farm. Further, from the manner of their growth, and mode of cultivation, they all tend to favour the production of weeds. For these reasons, and on the general principle that plants of the same or similar kinds should not follow in succession, the cereal grasses should not succeed each other, but should be preceded or followed by some crop, which either exhausts the soil less, or admits of a more perfect eradication of weeds.

2d, The leguminous plants cultivated for their seeds, as the bean and the pea, are all exhausters of the soil. They ripen their seeds, and these seeds are for the most part carried off the farm. Some physiologists suppose that they are less exhausters of the soil than the cereal grasses. It is probable that they do exhaust the soil somewhat less than the cereal grasses. But the essential difference between them, when considered with relation to their effect upon the soil, is, that, from their growth, and the manner of cultivating them, they are greatly less favourable to the production of weeds than the cereal grasses. By their broader system of leaves, they tend to stifle the growth of weeds more than the cereal grasses; and further, they admit of tillage during a great part of their growth. This is especially the case with the bean, which is therefore regarded as a useful cleaning crop, and so is cultivated in rotation with the cereal grasses, as a mean of preserving the land clean.

3d, Hemp and flax, which are cultivated chiefly for their fibres, and all plants cultivated for their oils,

are exhausters of the soil. They are suffered to form and ripen their seeds, and their stems afford no return of manure to the farm.

The next class of plants, from the large return of manures which the consumption of them affords, may be regarded as enriching or restorative crops, in contradistinction to the others, which may be termed exhausting crops:—

1. The turnip, the rape, and other plants of the cabbage genus, cultivated for their roots and leaves, and consumed upon the farm.

2. The potato, the carrot, the parsnip, the beet, and other plants cultivated for their tubers and roots, and consumed upon the farm.

3. The leguminous plants,—the clover, the tare, the lucerne, and others,—when cut green for forage, and consumed upon the farm.

The plants of the latter class, namely the leguminous, when mixed with gramineous plants, as the rye-grass, are commonly termed the artificial grasses, but would be more correctly termed the cultivated herbage or forage plants. They are often suffered partially to ripen their seeds, and are made into hay; and in this case they follow the general law, exhausting the soil more than when used green. And when the hay-crop is carried away from the farm, they are to be regarded as exhausting rather than restorative crops.

In speaking of these different classes of plants the following terms may be employed:—

1. The cereal grasses may be termed Corn-crops.

2. The leguminous plants cultivated for their seeds, Pulse-crops.

3. The turnip, and other plants of the same kind, cultivated for their roots and leaves, may, with reference to the mode of consuming them, be termed Green crops; or, with reference to the manner of preparing the ground for them, Fallow-crops.

4. The potato, and plants of other families cultivated for their roots and tubers, may, in like manner, be termed Green or Fallow crops.

5. The leguminous plants cultivated for green food, as the lucerne and tare, may be termed Green Forage-crops.

And, lastly, the mixture of gramineous and leguminous plants cultivated for herbage or green food, may, in compliance with common language, be still termed the Sown or Artificial Grasses.

Further, distinguishing these different classes of crops according to their effects upon the fertility of the farm, they might be divided thus:

1. Corn-crops,—exhausting crops, and favourers of weeds.

2. Pulse-crops,—exhausting, but cleaning crops or capable of being rendered so.

3. Green or Fallow crops,—restorative and cleaning crops.

4. Green forage-crops,—restorative and sometimes cleaning crops.

5. The sown grasses,—restorative crops.

Knowing these the general characters of the cultivated plants, we have, in devising a rotation, to cause the restorative and cleaning crops so to alternate with the exhausting crops, as that the land may be preserved fertile and clean. Further, when we find that land cannot be sufficiently cleaned by means of cleaning crops, we must make use of the summer-fallow; and again, when we find that land requires rest, we may lay it down to grass for a longer or shorter time, taking care when this is done that the land shall be in as fertile a state as circumstances will allow, and free of weeds.

The application of these principles will be best explained by adverting to some of those courses of

crops which have been found good in practice, both as maintaining or increasing the fertility of the soil, and as admitting of an economical division of labour upon a farm.

The first of these courses is the four-years' course, or four-shift course, as it is sometimes called. This course is of very general application, and forms the basis of nearly all the most approved rotations on the lighter soils and inferior clays of this country.

It consists of a regular alternation of the following crops.

1st year, Turnips or other green crop manured.

2d Corn-crop, as wheat, barley, or oats.

3d Sown grasses.

4th Corn-crop.

In this course, we observe that each exhausting crop alternates with a restorative one: and that, in each year, one-half of the farm is under exhausting, and one-half under restorative, crops.

This rotation is adapted to a large class of soils fit for carrying green crops, though these soils ought to be rather of the better class, in order to admit of a continuance of this course in cases where there does not exist a supply of extraneous manures. When the whole produce of the restorative crops, namely, the green crop and cultivated grasses, and the straw of the corn-crops, are consumed upon the farm, the fertility of the soil will generally be maintained under this course. But when these are partially carried away, a supply of extraneous manures is necessary, otherwise the soil will decrease in fertility, and the course become what is termed a scourging one. This course, although an admirable one for an extensive class of soils, has this defect, that the crops of the same kind return at too frequent intervals, and hence are apt to fall off in quality and productiveness. Under a long continuance of this course, the red clover can often scarcely be made to grow. The land is said to *tire* of the crop, and the expression and the fact illustrate the general principle before referred to, that plants of the same species should not return at too short intervals.

The four-years' course, however, with the defects that attend it, is of very general application. It was derived from Norfolk, and is frequently termed the Norfolk-course, and it is, in a great measure, from its general adoption that the husbandry of that county has become so celebrated.

The summer-fallow may be substituted for the manured Green-crop in the first year of this course, and then the course becomes:—

1st year, Summer-fallow;

2d Corn-crop.

3d Sown grasses;

4th Corn-crop.

The course thus modified, is adapted to the stiff and humid clays, where turnips and other green crops cannot be profitably raised. The course is defective in this, that the summer-fallow is too frequently repeated; and it has the same defect as the Norfolk-course, as to the too frequent return of the cultivated red clover.

Other rotations, founded upon these, are produced simply by prolonging the period for which the land sown with grass-seeds shall remain in grass. When the course is intended to be for five years, the land remains two years in grass, thus:—

1st year, Summer-fallow, or green crop manured;

2d Corn-crop;

3d Sown grasses;

4th Grass for pasture;

5th Corn-crop, generally oats.

This excellent course is less severe than the four years' course, and requiring less manure to maintain

or increase the fertility of the soil, it is better adapted to all soils of inferior quality. It does not yield so great a gross produce as the four-years' course, and therefore, where the soil, or the command of manures, admits of the latter, there is not any reason why it should not be preferred. But in other and dissimilar cases, the five years' course, as this is frequently termed, will be found to be preferable. Wherever, in this course, the soil is suited to the production of green-crops, the first crop of the series should be of that kind. But when the land is not suited to the production of green crops, or when, from any cause, the summer-fallow is to be preferred, then the summer-fallow may supersede the green crop in the first year of the series.

Although the five-years' course, which allows the land to remain two years in grass, is suited to soils pretty low in the scale of fertility, yet it is often necessary, when the soil is poor or exhausted by previous cropping, to allow it a longer rest; in which case, the land, instead of two, remains three or more years in grass.

The four and the five-years' courses are suited, it has been said, to a great extent of land in this country. But the richer clays, as well as the lighter loams of the better class, admit of a more extended and varied range of cultivation; the particular plants to be produced being determined by demand for the produce, peculiarity of local situation, command of extraneous manures, and the like.

When this is the case, it is easy to extend the four-years' course in a manner to comprehend the further plants to be produced. Let it be supposed that the land is of the richer clays, and that it is suited to the summer-fallow, then the course may be:—

- 1st year, Summer-fallow, manured;
- 1d Wheat;
- 3d Sown grasses, generally for hay or green forage;
- 4th Oats;
- 5th Beans, manured;
- 6th Barley or wheat.

This is a course deserving of imitation in all the cases suited to it, that is, where the soil is sufficiently clayey and rich, and does not require rest in pasture. Under this course, it will be seen that two-thirds of the farm are under exhausting crops, and one-third in summer-fallow and restorative crop.

A slight deviation can be made on this course without altering the principle of it, namely—

- 1st year, Summer-fallow, manured;
- 2d Wheat;
- 3d Beans;
- 4th Barley or wheat;
- 5th Sown grasses, generally for hay or green forage;
- 6th Oats.

But we can render this course less severe, by allowing the land in grass to remain two years in that state, when the course becomes—

- 1st year, Fallow;
- 2d Wheat;
- 3d Sown grasses;
- 4th Grass;
- 5th Oats;
- 6th Beans;
- 7th Barley or wheat.

In which case we have three-sevenths in restorative crops, and four-sevenths in exhausting crops. It is therefore more severe than the four-years' course, in which two-fourths are in exhausting crops. When the soil is light and fertile, as a sandy or gravelly loam, the summer-fallow of the last-mentioned

courses may be dispensed with, and any kind of green crop substituted:—

- 1st year, Green crop, as turnips, potatoes, beet or the like, manured.
- 2d Wheat or barley;
- 3d Sown grasses;
- 4th Oats;
- 5th Peas or beans, manured.
- 6th Barley or wheat.

Under this course, as before, two-thirds are exhausting crops, and one-third restorative crops. The course requires a good soil. It may be rendered less severe, by allowing the land to remain two years in grass, in which case the course becomes—

- 1st year, Green crop, manured;
- 2d Wheat or barley;
- 3d Sown grasses, for green forage or hay;
- 4th Grass for pasture;
- 5th Oats;
- 6th Beans or peas, manured;
- 7th Barley or wheat.

In this case we have three-sevenths in restorative crops, and four-sevenths in exhausting crops, in which respect it appears inferior to the four years' course; but it is superior to it in this, that the crops are more varied, and if we shall make wheat only once in the rotation, it will fulfil in an eminent degree this condition, that two crops of the same species shall return at as distant intervals as possible.

These several courses illustrate the principle of a good system of rotations as applicable to the plants commonly cultivated in this country, and they are all capable of being reduced to practice upon the farm. They may serve as the basis of other courses, where plants not enumerated here are to be introduced into the course.—*Low's Agriculture.*

#### GRINDING FOREIGN WHEAT IN BOND.

It seems to be understood, that though the proposed measure for authorizing foreign wheat to be ground in bond for exportation has been thrown out, the parties interested have not wholly lost the hope of succeeding in some measure of that kind, and at no very distant period. Their reliance is on the more favourable opinion which is now supposed to be entertained by the agricultural committee on the subject, arising out of the conviction they have arrived at, that the measure could not materially affect the agricultural interest, and might even be attended, under certain modifications, with advantage to them. When the deputation had a communication with the Board of Trade upon this matter in the latter end of last year, they were plainly given to understand that their only chance of success would be their making it in some way or other acceptable to the agricultural interest, whose views the Government could not venture to resist, and the opposition from that quarter led, in fact, in a great degree, to the loss of that measure. But there arose also some opposition for other reasons, with respect to which the parties loudly complain of the conduct of Mr. Poulett Thompson, who, after assuring them that there was no danger but from the agriculturists, insinuated doubts in his speech on the occasion whether such a measure could be adopted with safety to the revenue, which was a very different question. As the business is now in the hands of men of spirit and perseverance, who are not to be baffled by one repulse, they will certainly push the matter forward on every fit occasion that may present itself. There has been a report current, it seems, in the corn trade, that Ministers themselves had some plan in view calculated to effect their object, but this is an error. All that can be said is, that some communications have been made which have had some influence upon the agricultural committee, and that the merchants and others with whom it originated remain staunch in the pursuit of the plan they had in view.—*Times.*

## PROPOSED EXPERIMENTAL FARM.

The breeding of horses being a branch of rural economy, at once important and interesting, I beg to direct public attention to the subject; and as Mr. Dick's views nearly coincide with my own, I shall take advantage of his suggestions to show how the amelioration of the present breeds may be influenced and advanced by the establishment of an Experimental Farm.

Mr. Dick remarks that too loose notions are entertained in regard to the advantages to be derived from the proper selection of both sire and dam—that little attention has been paid to the subject, and that any kind of a mare, when rendered useless for every other purpose, has been thought good enough to breed from. But what is the consequence? The foal is reared—it is sold by the breeder at perhaps half the sum it costs to bring it up—it never pays for the food it consumes, and the breeder is continually exclaiming that the rearing of horses is a losing concern. How much less will it repay him for the risk he runs? For it is not like a bullock which will sell even although it may have a lame leg, or a badly formed joint. On the contrary, if any accident befall it (and to how many accidents and diseases are foals liable,) it is rendered useless; nor is the breeder the only loser, for the purchaser also has his sorrows to commence.

But the matter is of still more importance in a public point of view; for if we suppose that there is in the country not less than 1,500,000 horses—and that one-tenth of these are not worth the food they consume, the loss to the community is immense. Suppose, for example, that an ordinary sized horse cost 25*l* in rearing until he is four years old; suppose him also to be one of those nondescript animals to which I have been alluding, what will then be his value?—He is dear to any one as a present. We shall, however, suppose him to bring four-fifths of his cost in rearing—and the owner will be glad to get rid of him even at such a price) yet even on this supposition the total loss to the country on the aggregate number of inferior stock, which we have assumed to be one-tenth, will amount to the enormous sum of 1,500,000*l*, although the animal should then become worth his food. The loss, however, does not stop here. If he passes at four years old from the breeder's hand, still he continues to consume the produce of the country, without making an adequate return; for if we value the average value of a horse at 20*l* per annum, one of these inferior animals will do one-fourth less work than a good horse, which will make 5*l* of additional loss on each; and if we assume this description of stock to amount to one-tenth of 1,500,000*l* the total number, there will be a total loss of 750,000*l* on their labour. There is another circumstance, however, connected with these mal-formed animals, that merits consideration—viz, that from their defective formation they are unable to endure the degree of fatigue to which they are exposed—and are cut off at premature age. In one point of view, therefore, the expenses attending them are saved, but the short-lived nature of these animals is of itself a very great loss. For if we suppose the average life of horses to be 15 years, it will be found that the life of these nondescript animals is one-third short of this period, making a still farther loss of 125,000*l*. So that the total amount of real loss to the public, is 2,375,000*l* exclusive of the many accidents caused principally from their mal-formation and the extra attendance of the veterinary surgeon, whose services are thus rendered necessary.

The body of an animal may be considered as a piece of mechanism, the moving power of which is the vital principle, which, like fire to the steam engine, sets the whole in motion, but whatever quantity of fire, or vital energy, may be applied, neither the animal machine, nor the steam engine, will work with regularity and effect, unless the individual parts of which the machine is composed are properly adjusted, and adapted to the different purposes for which they are intended. It is not enough that the animal machine is put in motion by the noblest spirit, or nourished by the highest blood; every bone must have its just proportion, every muscle or tendon its proper pull, every lever its due length and arrangement, every joint its most accurate adjustment and perfect lubrication—all must have their relative proportions and strength before the motion of the machine can be accurate, vigorous, and durable. From what has been stated, it may be inferred that it is necessary to obtain those animals for breeding which approach as near as possible to perfection in their mechanism, for if "like produces like," we can only expect to obtain an improvement in the breed by such means.

In making such selections, various circumstances are to be attended to,—such as the kind of progeny wished for, and the local situation where they are to be reared. In all cases, size, and strength in proportion, combined with the greatest possible action and mildness of temper, are indispensable qualities required in both sire and dam, and the nearer they approach each other in these respects, so much the better; for although blood in horses may be of less consequence than is generally supposed, I am far from recommending that unnatural and violent crosses should be resorted to. The different varieties, I allow, arise from one parent stock, but the influence of climate, and other circumstances, have in a succession of generations, combined to alter their form and size, and, consequently it has been found necessary to divide them into various classes. The animal economy is endowed with a power of accommodation by which the individual constitution adapts itself to the situation in which it is placed. Nor is this law confined to the animal economy alone, for we find it pervading the whole face of nature, linking all together in one harmonious whole. In the deserts of Arabia, the warmth of its climate, the scanty herbage, or the detachedness of its luxuriant patches, would be but ill adapted for the maintenance of animals such as London draft horses. There we find an animal adapted, both by his frame and constitution, for the situation in which he is placed. He possesses a lightness of form, a hardness of muscular fibre, an activity and durability, which, with the fineness of his coat enable him to display those powers of speed for which he is celebrated.

But if we remove him from those arid deserts to the luxuriant pasturage of Flanders, or the Fens of Lincolnshire, or turn him adrift on the bleak and barren mountains of Shetland or Wales, we find him on the one hand gradually acquiring the most gigantic dimensions, from the nutritiousness of his diet and the trifling exercise required in procuring it; and on the other, shrinking into a mere dwarf from the incongeniality of his situation, and the scantiness and poverty of his provender.

It is the capability of changes being effected by domestication, that demands attention. If natural processes were uncontrollable by art, the interference of man would be of little avail. But when we find so much in his power, the greatest attention is necessary to give his efforts a proper direction.

When we look to animals in a state of nature, we perceive a striking uniformity in form and colour. In the domesticated state, how various are they! and why? The answer is obvious—they vary according to our capricious interference.

Seeing, therefore, the urgent necessity and manifest advantages of an improvement in this branch of rural economy, together with the almost unlimited power that breeders possess in accomplishing it, the grand desideratum is to direct this power into such a channel as will best accomplish the object in view. And for this purpose I would recommend to those agricultural societies, which are in the habit of giving premiums with a view of obtaining the best horses, to recollect that when they have procured a horse to their mind, they have done only half of what is requisite. They ought also to select the best mares in the district to breed from. Without attending to this point, they never will arrive at the beneficial results that would otherwise accrue from their labours. I would also recommend as an experiment, that some agricultural society should offer a handsome premium for a draught stallion (say £100), so that the money from the mares would not be required as a remuneration to the owner. Having thus made a selection of one of the best horses in the country, let the society then appoint a committee of the most approved judges, to whom the mares intended to be bred from should be submitted, and let only such as are approved of by this committee be allowed to be served by the prize horse.

Such an experiment, if judiciously executed, would I am certain, be attended with the most beneficial results, and each successive repetition of it would effect an increased and increasing improvement in the breed, until, by reiterated applications, so great and general an advancement would be accomplished, that numerous subjects, possessing all the requisite qualities could be obtained, from which the county could be supplied with a stock of horses, approximating, as nearly as possible, to perfection. Nor could the advantages of such experiments be confined to the individual county in which they originated, but by attracting the attention of the neighbourhood to the importance of making a proper selection, both of sire and dam, and practically demonstrating the kind of animals most proper for breeding from, they would stir up a spirit of emulation and attention to the subject, which could not fail to afford both profit and instruction to all who engaged in them.

Such is the substance of Mr. Dick's remarks, and I am sure every practical agriculturist must feel satisfied of the propriety of the course he advocates to rectify the mistakes into which the breeders of horses have so generally fallen. The urgent necessity that exists is a most powerful inducement for some local association bestirring itself in the manner he proposes; and I speak not unadvisedly when I say that were the simple plan, suggested by Mr. Dick, judiciously acted upon and generally adopted, in the course of time it would be the means of enhancing the value of horses throughout Britain to a very great extent. But in order to effect this, a general movement of the whole country is essentially requisite, and it surely requires no arguments of mine to show that such a movement can never be impressed upon the energies of even a considerable portion of the country by any local association, however disinterested and enterprising. At all events, if barely possible, it would require the lapse of many years, (I may safely say centuries) to accomplish it. Acting as they do without either concert or co-operation, and actuated as in many instances they are by feelings of jealousy towards each other, the informa-

tion and experience gained, are never made available for the general good. Consequently, it is only by collecting these energies into one grand focus, as it were, and thus giving them a concentration of purpose and unity of design, that the means employed can ever prove effective, or the results successful. And here it must be gratifying to every one interested in the establishment of an Experimental Farm to perceive how admirably adapted such an institution would serve for the accomplishment of these ends, and its manifest superiority over the utmost exertions of any local association, however well regulated or individually excellent.

As an Experimental Farm on the plan proposed in the Suggestions, contemplates the improvement, not of one particular branch only of agricultural science, but a radical amelioration of the whole in all its details, the breeding of horses would necessarily form an important and prominent feature in its economy. I shall now shortly point out the manner in which this particular branch of rural economy would be affected and improved by the operation of such an establishment.

Its action would be two-fold.

1st. Let the manager commence a general registration of the principal draught stallions in the country, through the medium of the local associations, noting their particular excellencies and defects. Let him also introduce a few breeding mares into the farm, possessed of as many of the essential requisites as possible, and proceed in the manner pointed out by Mr. Dick, to select both sire and dam according to their desirable properties and perfections. Through time and attention, and by repeated experiments, there can be little doubt but that a few warranted superior animals would be annually propagated for the use of the country. Thus, Mr. Dick's proposal would be practically developed, under every circumstance calculated to ensure its success, and an example as well as inducement given to local associations, to follow in the same track. But as this particular mode of improvement, although sure and satisfactory, could never be adopted by any single establishment, on a scale commensurate with the wants of the country, the Experimental Farm would obviate this defect.

2dly. By the head agricultural association in each county co-operating with the parent institution, and transmitting to the manager the names and general character of the breeding horses employed in their respective districts, together with the names and designations of the owners, and also the persons who have them in charge. These communications might be sent twice a-year, with a distinct and careful report of the probable number of stock each horse has thrown—with their appearance and supposed usefulness. The manager, by carefully registering their reports, would, in a few years, be enabled to give to every horse his respective character, and through time the superior breeds would signalize themselves. Instead of farmers depending for the characters and qualities of a horse, as at present, upon the bare assertion of the person who travels him—whose statement, it is natural to suppose, must be partial and interested—they would merely have to turn up the manager's register to be made acquainted with the nature of the progeny he might expect. This would, in a great measure, secure him from the machinations of those who scour the country with inferior animals, at present a pest to every district and county in the kingdom. Such a system of registration would also be the means of obviating another evil of considerable magnitude. Those local associations, that award premiums to breeding horses seldom give them to such

as exhibit the greatest number of certificates of usefulness. The judges, having no standard to guide them, generally decide according to the appearance of the animals, and the high condition in which they are kept, renders it a difficult matter either to detect their faults or appreciate their merits. The consequence of this is, that when a person really has a good horse, and sees inferior animals preferred, he becomes disgusted, and either sends him to a distant county, or disposes of him to some of those individuals who keep moving from one district to another, rendering the animal of little or no avail to the public, and, perhaps, through mismanagement, ruining him altogether.

It is thus that an Experimental Farm would be the means of introducing into the country a superior breed of horses, perfect in symmetry, and in every way suited to the different purposes for which they may be required, and that, too, without in the slightest degree interfering with the exertions of the local associations already existing. On the contrary, taking the lead in the grand march of improvement—as such an establishment might be expected to do—it paves the way, and directs the efforts of its more humble coadjutors. Like the skilful pioneer it precedes them in the career of usefulness; but it is only for the purpose of removing every obstruction and difficulty that each, and all of them, may arrive at a like state of advancement and perfection.

Trusting that the foregoing observations will meet with the approbation of my brother agriculturists, I shall at present draw them to a close. At a future period I may point out some further advantages, that would accrue to the agricultural community and the country at large, from the formation of an Experimental Farm.

A SCOTCH FARMER.

## TO THE EDITOR OF THE YORK HERALD.

SIR,—As there is now-a-days, both in town and country, no small stir upon the subject of agricultural distress, and the probable cause of that distress, should the following lines upon that very important subject be thought worthy of a place in your very useful paper, the insertion of it will certainly oblige your very humble servant. The agricultural meetings I observe are numerous attended both by landlord and tenant, some of whom enter rather largely into the subject, and though a variety of opinions are freely offered as to the cause of the present low prices of grain, and especially of wheat, yet (with all due deference both to the speakers and their speeches) I really think, Sir, that many of them greatly err in judgment respecting it. One supposes the principal cause is, the currency bill; another flings all his weight upon excessive taxation; a third tells us that the present corn laws are the sole reason of this dull state of things, whilst they all miss or overlook a plain and simple sort of a rule of three question, namely, if a redundant supply of any given quantity of wheat, has reduced the price to 35s per quarter, what would the probable effect of the same given quantity be, if not thus necessitously forced upon the market? Demand and supply always was, and always will be the chief hinge upon which turns any alteration of prices. It matters but little to the grower, provided his corn be in good request, whether it be eaten carefully up in time of peace, or whether it be eaten or partly wasted as in time of war. 'Tis true that the consumption of wheat is now great, that of barley great also, but the supply, and the

ready means of getting that supply to market being still greater, the consequence is, that not only is the moderate speculator put by, but the farmer with all his produce (especially of wheat) is unhappily thrown upon his retail customer, who too well knows, that in order to meet some pressing payment, he must sell at almost any price; and under existing circumstances, Sir, the more he sells, the more he may.

Now the currency question, or taxation, or even the present corn laws, can be properly blamed as the immediate cause of agricultural distress, I am utterly at a loss to conceive, and in order to show the fallacy of those objections more fully, and to prove that the above named premises are comparatively valueless, the farmers' own hand-writing abundantly testifies, that it is demand and supply and demand and supply chiefly, if not entirely, which moves the markets. Take for instance, the two articles of oats and beans, the former of which from very low prices indeed, was, during the past Summer, very ready sale at an advance of at least 10s per quarter upon the prime cost. The latter, a commodity for the most part consumed by cattle, was equally ready sale at several shillings per quarter higher than the average price of wheats, whilst wheat is now given in no small quantity for the feeding both of horses and dogs, pigs and oxen, and all this merely because the supply of the former were much short of the demand, whilst of wheat, there was, but now is a declining, though rather heavy surplus.

Having made these few remarks, Mr. Editor, I would now appeal to those three most upright judges for the confirmation of them, to common sense, to business habits, and to common business observation, and fearlessly ask, whether it is demand and supply, or the currency question, taxes, and corn laws united, which bear most upon the subject of agricultural distress. The three alleged causes of difficulty, bore all alike and at the same instant of time, upon the several commodities of the arable farmer, yet his trade nevertheless is turned upside down; his wheat, which once was the standard of his strength, and of his hopes and fears, is now altogether an underling, and perhaps may only rally again, either from a comparatively scanty supply, or from some unforeseen political movement of the nations. This topsyturvy sort of thing, seems to me, Sir, most unnatural, it is like unto silver bullion bearing a higher market price than gold, copper than silver; and not unlike also, a minor supplanting his father; and so convulsed is the entire business of farming, as to depreciate both the land and its produce, far below its own intrinsic value; for after all, we all live out of the land, and if that interest cannot be kept reasonably and profitably going, by and by, we shall be thrown too much upon the foreigner, and he is cunning and crafty enough always to prefer sovereigns even to manufactured goods.

As further proof, Sir, that my premises are tolerably good, I would also bring forward the general prosperity of the manufacturing districts, the which, with the very same legal enactments out against them, as is said, to fetter the farming interests, are now doing an immense stroke of more or less profitable business, and all this again, merely because demand takes the lead of supply, I care not whether the demand be great or small, for so long only as supply hobble on in the rear, trade will be brisk and beneficial.

It would be a most dangerous experiment, Sir, especially in dangerous times, for Parliament to move the nation upon such a tickle subject as the currency question, a nation is a very unwieldy creature, and can only or best be moved, as she moves herself.

Governments are now getting this hard lesson off, and kings are getting to understand, and I hope to believe, that they rule not for themselves alone, but for those more especially over whom Providence has been pleased to place them; and it would be most unfair indeed, as well as hurtful to the nation generally, thus to undo, or spoil at least, the numberless transactions effected upon the faith of a previous monetary system, and at the great risk of substituting a worse for a better. The nation is quite tired of being sent for every trifling cause, to the infant school; confidence, both individually and nationally, always requires a consolidating rather than a weakening influence, and it is only so far as good faith cannot possibly be any longer maintained, that any breach of it, is at all justifiable.

An objection has likewise been taken by several leading and influential men, who as with one accord assert, that taxation also bears hard upon the landed interest; perhaps it is slightly felt, but only slightly; I am not aware that the abstract farmer pays any direct taxes to the King worth the name, and as to his indirect taxes, he only pays according to his consumption, just in proportion as his labourer pays, and if the malt tax, against which so great a hue and cry is raised, were either partially or altogether repealed, I have yet to learn whether or no the farmer would be materially benefited thereby. A commodity situated as barley is, when once unnaturalized by taxation, does not (if even relieved of its load,) so soon recover its native state, and in the case now before us there stands between the relief and the relieved not a few both of maltsters, brewers, publicans, and beer-men, all alike ready to receive the benefit of that which was intended for the farmer, and I greatly mistake the signs of the times, Sir, if the farmer would not be left *minus* both in his expectations and in his pocket. A parallel case just now occurs to me; some few years ago the leather tax was repealed; but we all have still the pleasure, or rather the privilege, of paying almost as much for our shoes and boots as ever. It is the generally received opinion that labour is the wealth of any people, and if I were sent into some given circuit in order to ascertain as far as practicable the pecuniary healthy state of that district, my first inquiry would be—are your poor employed, and if so, are they earning remunerating wages? Should the answer be in the affirmative, to me it would be a decided proof that that circuit was more or less doing well; and though the farmer's present position is very much like unto what soldiers call their 'forlorn hope,' yet I humbly think, Mr. Editor, that theirs is not altogether a hopeless case.

There is an old saying, that "what is good for the tenant cannot be bad for the landlord." As one remedial measure, therefore, amongst the rest, let them cordially and strenuously unite purses, and give all possible employment to their labouring poor; by doing which they will at once embody all their extra-parochial poor and high-road rates in useful labour; and nothing perhaps will benefit the parties more than speedily to return to the good old practice of flail thrashing all their corn, and though rather a slow process it is a sure one, and will eventually tell, no doubt, to the good of all concerned.

In conclusion; I would just observe, in reference to the corn laws, that, in my humble opinion, the present law is perhaps the best that human wisdom can devise, inasmuch as—with all its faults and feelings—it alike protects the two extreme interests, made but sadly and madly too wide, by an over-anxious and zealous feeling of the two contending parties. The land's men have long feared, and still may justly dread a free importation; but Sir, I boldly

aver, the fact bearing me out, that by the beggaring system of machine thrashing something worse than a limited importation has long been going on; as by it the produce of the soil of England, if not under the custom-house key, is, nevertheless, in almost perpetual bondage to the man of money. I am no advocate, Sir, for high prices, or for taxes; having lived to see the great evil of them; but I am a firm and unflinching advocate for fair and reasonable profits. In sheer justice, Sir, the manufacturer should not forget, that though he professes to sell his goods at perhaps 30 per cent. lower than in times past, yet he must excuse my telling him that my coats, waist-coats, &c., are but 30 per cent worse in quality now than they were then. Not so with the farmer;—he is now selling his third successive year's produce of such super-excellent wheat as probably he may never have again, and at a great loss upon every waggon load that he delivers. I would fain recommend both parties, so far as is practicable, to join interests; not forgetting that they are inhabitants of the same soil, subjects of the same good and gracious King, and that the interests of one are, more or less the interests of both.

Begging you many pardons, Sir, even for the first time, of trespassing so long upon your valuable time and patience,

I subscribe myself,

Your most obedient servant,  
Hull, Feb. 2, 1836. J. J.

## REPORTS OF THE STATE OF THE CROPS.

FROM THE IRISH FARMER'S MAGAZINE.

For the following ample and circumstantial reports, we are indebted to the effective machinery of the Agricultural Society of Ireland, through the agency of various correspondents in all parts of the kingdom, and particularly of the Secretaries of the Local Farming Associations.

It will be seen from the following extracts, that last Winter was one of great and unusual severity, and has consequently operated very injuriously upon various interests of the cultivator.

In the unusual consumption of Winter fodder, its effects have been severely felt; and perhaps the more so, that the openness of some previous Winters threw the farmer off his guard, and induced a carelessness and want of that provident attention which, from the variable character of our climate, it imperatively demands.

The crops of wheat in most cold soils have suffered much; and in many places have partially failed. The sowing of oats has also been greatly retarded. It will be seen, that the quantity of wheat sown last year is far below the average of former seasons, (at least one-fourth less,) which together with the present unpromising appearance of the crop, must naturally lead to the conviction that the supply of that important article will be extremely limited in this country. Oats and barley have been found more remunerative crops to the farmer, and are, consequently, rapidly superseding the cultivation of wheat.

COUNTY CORK.—Some years since agricultural societies, based upon the grant afforded by Government, were introduced into this part of the kingdom.

The present appearance of the county speaks the lateness of the Spring; and to Mr. Robertson of Kilkenny, a gentleman of scientific knowledge and a close observer of nature, I am indebted for the informa-

tion, that this Spring is three weeks later than 1834 that is, the Spring of 1835 was one week later than 1834, and the Spring of 1836 is two weeks later than 1835; the consequence is, that all agricultural proceedings have been proportionably retarded—in many instances oats not as yet finished; the breadth of early potatoes must be very considerably diminished, owing to the inclemency of the weather; wheat looking thin but well coloured, but there is not the usual extent of wheat sown. Barley is likely to be the preponderating grain as to quantity, as in comparison with other years. For these last four days, 16th April—the weather has been favourable for all agricultural purposes, and no doubt much exertion has been made to make up for the lost time—as yet however there has been little vegetation.

COUNTY CARLOW.—The wet and cold of this Spring have very materially retarded the progress of the Spring crops; oats remaining in very many instances yet unsown, even in the low lands, and very little barley sown; however these last four days—18th April—having been dry and favourable much good will result, and should it continue, all will yet be got in though late. There is not near as much wheat sown in my neighbourhood this year as the average of the five preceding. This is owing partly to bad weather in November and December, and partly to the low price of the article last harvest. I have also to report that in several instances, some of which have come under my own immediate knowledge, fields of wheat sown in good time have partially or totally missed, and this on fine land; these have been ploughed up and prepared for barley. The consumption of Winter fodder has been considerable, but not much over an average. Unfortunately our farmers have not, except in a few instances in this neighbourhood, been in the habit of growing turnips, and succession crops are not understood nor attempted. Of artificial grasses I may say the same.

COUNTY DUBLIN.—The oldest persons in many parts of Ireland agree, that so wet a Winter as the last has not occurred for fifty years past, and that the present season is unusually backward and severe; consequently, the crops of wheat have in most cold soils suffered much, and those sown late are extremely backward. It appears however, on a close examination of those crops, that it is from bad cultivation or mismanagement that they suffered during Winter, the seed in some cases not being sufficiently covered, and in others the land not being properly drained, or well prepared by deep ploughing for Winter crop. In light soils, therefore, the earth is washed off the plants after a continuation of heavy rains, and if strong land be not stirred to a proper depth, the water cannot percolate to the sub-soil, and thereby keep the upper soil in a wholesome state for the growing plants to vegetate.

Spring crops are also very backward, and it is to be apprehended that early planted potatoes are much injured, and will be late and scarce. The slug and the rot have made great ravages, and where the land has been the most liberally manured with dung, this evil has increased. Lime ashes, or burnt clay, would be the fittest application to raise early crops, especially on cold or rich soils; and it would be a further protection from heavy rains or frost, to throw up the land in drills after the cuts being put in, and not levelled until they are about to push their shoots over ground. The Winter tares are also very thin and backward, and the grass land is bare on most soils, in consequence of the continued cold wind and frosts, which although not of that severity to injure wall trees, yet have materially retarded vegetation generally.

The consumption of Winter fodder has been great but the price of hay has not increased as much as might be expected near Dublin, in consequence of the introduction of Winter green crops, and the large produce of this article last year.

COUNTY FERMANAGH.—The cold and perpetual rain, has materially retarded our farming operations in this county. The sowing of oats is in consequence unusually late. This is not a wheat county, and from the low prices obtained last autumn (only 14s per 20 stone) much less was sown than formerly. Fodder of all kinds is extremely scarce, and much dearer than in the Dublin market. Green crops are not cultivated; turnips and rape are sometimes seen, but nothing like a rotation of crops; potatoes are planted two years running and succeeded by oats, without an intervening crop for three years more. Very little artificial grasses are sown; some small plots of clover may be occasionally met with in gardens only, and the gentlemen seem very indifferent about setting a good example to the lower classes.

KING'S COUNTY.—The spring sowing is in general ten or twelve days later than usual; the winter sown crops have planted and promise well. The ground under wheat is at least one-third short of the former years. There has been more hay consumed than usual; straw is usually all made into manure. Turnips are not generally cultivated; potatoes are in a pretty husbandlike manner, and to a considerable extent, both for the Dublin market and feeding stock. The advantages of succession crops are not generally understood, but the drill cultivation of potatoes has become general, and the produce of wheat has increased about one-third over their old fallow system, which is now nearly abandoned. Artificial grasses are in general use on large holdings.

COUNTY LONGFORD.—Owing to the continued wet and cold, and the circumstance of the soil being naturally moist, the spring sowing was much retarded, and very little done up to the 13th April. Not more than the average quantity of wheat has been sown this year, the ground not being generally fit for that crop. There has been an unusual consumption of dry winter fodder, the weather being too severe to keep cattle at grass, and consequently hay is dearer than it has been for some years. Turnips are cultivated solely by the gentlemen of the county. Succession crops are not practised or understood even by them, and artificial grasses are only cultivated in a few instances, and those more by way of experiment amongst the gentlemen, than by farmers.

COUNTY SLIGO.—During the last six weeks the weather has been exceedingly rough—winds westerly, north-west, and northerly, violent hail-storms, and until the last week (16th April)—the mountains were covered with snow. The spring work has been consequently retarded. I do not think that there were ten barrels of oats sown in this county previous to the 10th instant. In 1831-32, the small farmers were beginning to grow a good deal of wheat—1833 gave a tolerable return, but in 1834 the spring was wet, the crop partially failed, the hopes of many disappointed, so that last year, very little wheat was sown, and on Tuesday, April 12, I rode a very considerable distance and did not see a particle. On account of the severity of the season there has been an unusual consumption of fodder. Very few of the farmers in my neighbourhood have hay for their cattle. It would be almost impossible to buy oaten straw, and some barley straw was offered me for 2s per cwt, the average price in ordinary seasons is 10d to 11d; Hay is selling in some parts at 65s per ton, the usual price is 30s. Clover in quan-

titles from two to seven pounds, one seldom sees above two roods with any one individual; but I am happy to have it in my power to add, that the lower orders are beginning to appreciate most fully the value of these two crops; and I consider that there will be at least double the quantity sown this year than there was last. As to turnips, they are almost unknown, (of course I only allude to the lower order) except upon the verge of some reclaimed bog, or where potatoes might have failed upon the upland. It is rare to find innovations of even this magnitude. A general ignorance prevails of a judicious rotation of crops, and it is very up-hill work to have it followed.

COUNTY TIPPERARY.—I think that the progress of the spring crops, and growth of grass on pasture land has been retarded by the coldness of the weather this year, so as to be fully three weeks more backward than usual. As compared with former seasons, there is less wheat sown this year than usual. There has been more consumption of fodder this year than hitherto in consequence of the want of grass. Turnips and green crops are not cultivated except in the gentlemen's demesnes, and even there not to the extent they ought. As far as sowing red clover with a spring crop, cutting it for hay and ploughing in the after growth for a crop of wheat, the farmers have partially adopted a succession, but even in this they are somewhat discouraged, wheat not having in some instances succeeded well after red clover. Rye grass and red clover have come into use, and are likely to continue so, the farmers finding their advantage in having a crop of hay on their farm in place of paying 8*l.* and in some instances 10*l.* per Irish acre for mowing. For the last few years farmers have been discouraged from attempting any improvement from the ruinously low prices of wheat, which is the *rent paying* crop of this part of the country.

COUNTY WICKLOW.—In answer to the queries circulated by Mr. Pooler, the writer hereof has to state, firstly, that the uncommon wetness of the late season has very materially delayed the spring crops; for so incessant were the rains at about the time the potatoe crop had been removed from the ground, the wheat could not be sown; and land intended for that grain has been held over for barley and oats. The culture of wheat has been more extensively followed in this district than, in the opinion of the writer, is consistent with the nature of its soil. But this error has been felt, and is under a gradual correction. Farmers are more impressed with the value of a barley or oat crop than formerly, and acknowledge this agricultural truth, that a fine crop of an inferior grain is more remunerative than an indifferent or even middling crop of a superior. From the operation, therefore, of the causes adverted to, there is a less breadth of wheat sown than formerly. Barley appears to the writer hereof to have taken the place of wheat;—there has been a great demand for chevalier barley. So much, indeed, is it sought, that in very few years none other is likely to be found in this district.

The winter has been unusually severe, from rain and cold winds. The growth of grass is greatly retarded; and the consumption of hay and straw beyond expectation great. The writer has always had a large supply of hay, and been unaccustomed hitherto to use straw for fodder, but in the winter which has just closed, stern necessity compelled a resort to that article. This, however, arose partly from the severity of the winter, and partly from his crops of turnips and Swedes (about twenty-four statute acres) not being so heavy as expected.

Clover (red) has been grown, and is on the increase. The eye is not gratified by such an abun-

dance as may be desired, but still it is greatly on the increase. The quantity of seed annually distributed by the shopkeepers in Carnew, is progressively advancing; and this is a better criterion of the extended production of red clover than any estimate by the sight.

The district alluded to in the foregoing report, comprises the half barony of Shillelah, and the other contiguous parts in the county of Wicklow, and in the counties of Wexford and Carlow.

COUNTY WEXFORD.—I think the wet and cold of this spring have very materially retarded the growth of spring crops; my own rape, of which I have about ten acres, is very scant indeed, and a very general backwardness is evident. The prices of wheat, until this last month, have been so very low, that I think it probable there is not so much wheat sown this year as is usual, but I cannot speak with certainty on this point. The consumption of winter fodder has been very great, and is now very scarce. Cattle are generally very badly off. Turnips are not generally sown about this place. But there are a few small farmers who, by the introduction of premiums for horse feeding, are beginning to see the necessity of green crops, to enable them to keep in their cattle; and I make no doubt the very great advantages of the system will induce others to try it. It cannot be said however, to be generally felt or taken up.

COUNTY LOUTH.—The wet cold spring has so far retarded labour, that half the oat crop is not sown yet, it has also perished much of the winter sown oats, and consequently, they must be sown over again. There is not more than half the usual crop of wheat sown here this season, and our greatest crop formerly was wheat. Hay and straw are unusually dear, the former four shillings and the latter two per cwt, and it is very probable they will be much higher, grass is so late, from the excessive wet and cold. Turnips are not much sown in the immediate vicinity of Dundalk, as manure can be so easily purchased there, but some distance from the town they are sown very extensively—100 bullocks have been fed this season on turnips and potatoes within three miles of me. The great benefit of succession crops is also beginning to be understood and appreciated in this county, and farmers in general embrace that kind of culture. There is not an acre of land laid down in this county that is not sown with clover and rye grass. There is a kind of rye grass seed imported here from Scotland this season, called Italian rye grass, which is sold at £1 per bushel, engaged to cut twice in the season, four feet the first and three feet the second cutting. It has proved itself in Scotland to be a biennial, and they think it may turn out to be a perennial.

I wish to draw your attention to the growth of flax and saving the seed in Ireland. A friend of mine had ten acres sown last year. He let it ripen, and then harvested it like corn. In February he thrashed it; and I never saw finer seed—and an amazing quantity. In the beginning of March he steeped it: from the cold of the water it require a longer time in the water, but when spread on his meadows, it proved as good as a coat of manure at that season, and covered thirty acres of grass land, which will cut a month sooner from the shelter of the flax. We could save as good flax seed in this way in many parts of our neighbourhood, as ever was saved in Holland or America, and I am sure it would keep £200,000 in Great Britain and Ireland every year, which is now transported from us to support other nations. I have this moment in my possession some of the same flax dressed, and although it is what we call blay, it is as fine a specimen of silky flax as I ever handled.

*Arabian Horses*

sent from the Ducourt of Mevrat, to a Peasant by the Marquis de Villars, 1750.

## HIS MAJESTY'S ARABIANS.

(FROM THE SPORTSMAN FOR MAY.)

These animals, consisting of two stallions, two mares, and a foal, lately arrived in this country from the Imaum of Muscat, by whom they were sent as a present to William IV. Muscat, which we find spelt Mascat in our Gazetteer, is represented as "a seaport of Arabia Felix." We believe it is the capital of a province of the same name, and the most fertile part of Arabia Felix, where horses of the highest class are produced. However, before we proceed to describe the animals which form the subject of our present embellishment, we will quote the history of the Arabian horse as given by an elegant writer, a man of unwearied research. Mr. Crichton, Editor of the *Edinburgh Advertiser*, shall speak for himself:—

Arabia has been called the native country of the horse; and certainly if the most valuable conquest of man over the animal creation be that of this noble quadruped, which shares with him the fatigues of industry and the glory of war, no nation merits that distinction better than the Arabs. The care and affection which they bestow in breeding and rearing it, and the decided predilection with which it is constantly regarded, are founded not merely on its utility to them in their predatory and wandering life, but also on an ancient prejudice which induces them to consider horses as beings endowed with generous sentiments, and an intelligence superior to that of other animals. They suppose that these noble creatures, so serviceable in the cause of Islam, have obtained, through Mahomed, the blessing of God and an occult capacity to read or repeat tacitly every day some verses of the Koran. It was one of their old proverbs, that after man, the most eminent creature is the horse: the best employment is that of rearing it; the most delightful posture is that of sitting on its back; the most meritorious of domestic actions is that of feeding it. They were taught by their Prophet to believe that it was originally predestined for their special service. "When God," said he, "wished to create it, he called the south wind, and said, 'I desire to draw from out of thee a new being; condense thyself by parting with fluidity,'—and he was obeyed. He then took a handful of this element, now become tangible, and blew upon it, and the horse was produced. 'Thou shalt be for man,' said the Lord, 'a source of happiness and wealth; he will render himself illustrious by ascending thee.'" The "brood mares" were particularly recommended by Mahomed to his disciples, "because their back is the seat of honour, and their belly an inexhaustible treasure. As many grains of barley as are contained in the food we give to a horse, so many indulgences do we daily gain by giving it."

The care which the Arabs take in classifying and preserving the pedigrees of their horses, to a European must appear almost incredible. The collective term whereby they designate horses in general is *Kohayl* or *Kochlani*; but they commonly distribute them into five great races, all originally from Nejed. Some authors trace them back to the most remote times of Paganism, assigning as their sire the famous stallion Mashour, the property of Okrar, chief of the Beni Obeida. Others assert that they are merely the issue of the five favourite

mares of the Prophet named Rhabdo, Nooma, Waja, Sablia, and Hezma. Whatever be the fact as to these genealogies, history has certainly commemorated from a very ancient period the names and noble qualities of some of the Arabian horses. With the beautiful description of the war-steed in Job (chap. xxxix. 19—27) every reader is familiar; "his neck is clothed with thunder; and the glory of his nostrils is terrible: he paweth in the valley, and rejoiceth in his strength: he mocketh at fear; neither turneth he back from the sword: he swalloweth the ground with fierceness and rage, and smelleth the battle afar off." The famous racers Dahes and Ghabra have been already noticed (vol. i. p. 186), from which it would appear that the amusements of the turf were among the national festivals of the ancient Bedonins. D'Herbelot speaks of the *Kamel el Sanuteyn*, an old work which treats of the keeping and physicking of horses. Another on the same subject, still more curious, bears the title of "Summary of all that can be desired to be learned respecting the different Race Horses." According to the author of this treatise all the breeds already alluded to sprung from a stallion and a mare, called *Zadal Rakeb* and *Serlet Shekban*, which belonged to Muthayer Ibn Oshain, chief of one of the primitive tribes of Yemen. He has given a table which contains 136 races of Arabian horses,—three Persian, nine Turkoman, and seven Koord,—and mentions the *Safenet* as being of the same species with those presented to Solomon by the Queen Sheba. The modern Bedonins repose implicit faith in the traditions of antiquity, and still reckon their five noble breeds to be descended from the stud of the Prophet. The following are their names:—*Taweyse*, *Manekeye*, *Koheyl*, *Saklawye*, and *Julfa*; which according to the vulgar notion, are derived from the different districts of Nejed, where they were born. These principal races diverge into innumerable ramifications. The *Saklawye* is subdivided into the *Jedran*, *Abyryeh*, and *Nejn el Subh*; the *Koheyl* into *Ajuz*, *Kerla*, *Sheikka*, *Dabbah*, *Im Khweysha*, *Khumeysseh*, and *Abu Maarreff*; the *Julfa* has only a single branch, that of *Estemblath*. Besides these, they have various others of a secondary or less-esteemed breed, such as the *Henaydi*, *Abu Arkub*, *Abayan*, *Sheraki*, *Shueyman*, *Hadaba*, *Wedna*, *Medhemeh*, *Khabitha*, *Omeriah*, and *Sadathukan*. The different races have not any characteristic marks by which they can be distinguished from each other. Every mare particularly swift and handsome, with noble blood in her veins, may give origin to a new stock, the descendants of which are called after her; so that the catalogue of distinct races in the Desert is almost endless. The only means of recognising them is by certificates of their genealogy, which are drawn up by the proprietors, and attested by witnesses: in these the issue, both masculine and feminine, are specified with great exactness; so that an Arabian horse offered for sale is usually provided with his title of nobility. The pedigree is often put into a small piece of leather covered with waxed cloth, and suspended round the animal's neck. Burckhardt has given one of these curious documents which he translated from the original hand-writing of the Bedonins. It is as follows:

"GOD.

"Enoch.

"In the name of the most merciful God, the Lord of all creatures, peace and prayers be with our Lord Mohammed and his family and his followers until the day of judgment; and peace be

with all those who read this writing, and understand its meaning.

"The present deed relates to the grayish-brown colt, with four white feet and a white mark on the forehead, of the true breed of *Saklawye*, called *Obeyan*, whose skin is as bright and unsullied as milk, resembling those horses of which the Prophet said, 'True riches are a noble and pure breed of horses;' and of which God said, 'The war-horses, those which rushed on the enemy with full blowing nostrils,—those which plunge into the battle early in the morning.' And God spoke the truth in his incomparable book. This *Saklawye* gray colt was brought by *Khoshrum*, the son of *Emhey*, of the tribe of *Zebaa*, an *Aeneze* Arab. The sire of this colt is the excellent bay horse called *Merdjan*, of the breed of the *Kohey*lan; its dam is the famous white *Saklawye* mare known by the name of *Djeroua*. According to what we have seen, we attest here, upon our hopes of felicity, and upon our girdles, O Sheiks of Wisdom and Possessors of Horses! this gray colt above mentioned, is more noble even than his sire and dam. And this we attest, according to our best knowledge, by this valid and perfect deed. Thanks be to God, the Lord of all creatures!—Written on the 16th of *Saphar*, in the year 1223 (A.D. 1808). Witnesses," &c. &c. &c.

This purity of blood and descent the *Bedouins* are extremely careful to preserve uncontaminated. During twenty days, at a certain season, the mare must be watched to secure her from the approaches of any common horse, which she is not allowed to see even at a distance; for the Arabs are believers in the effects of imagination on the progeny of their cattle. When the foal is produced the same witnesses must be present, and within seven days a notarial certificate of its legitimacy is made out, in which is written an account of the colt's distinctive marks, with the names of its sire and dam. These genealogical tables called *Hujeh*, never ascend to the granddams, because it is understood that every Arab of the tribe knows by tradition the purity of the whole breed. Nor are such testimonials at all necessary in the interior of the Desert, where many horses are of such illustrious descent that thousands can attest their nobility. A *Bedouin* would laugh at being asked by an inhabitant of *Nejed* for the pedigree of his mare; written evidence he never thinks of producing, except when attending distant markets, such as *Bussora*, *Bagdad*, *Damascus*, *Aleppo*, *Medina*, or *Mecca*. A colt, at the moment of birth, is never allowed to drop upon the ground; they receive it in their arms, and so cherish it for several hours, washing and stretching its tender limbs, and caressing it as they would a baby. After this they place it on its legs, and watch its feeble steps with particular attention, prognosticating from that time its future excellencies or defects. The ears are tied together over its head with a string, that they may assume a fine pointed direction: the tail is pressed upwards, and other measures taken at the same time, in order that it may be carried high. The only care taken of the dam is to wrap a piece of linen cloth round her body, which is removed next day. At the end of a month the foal is weaned, and for the space of a hundred days thereafter it is permitted no other food than camel's milk. When that period has elapsed it receives a daily portion of wheat diluted with water. A handful only is given at first; by degrees this quantity is increased; although milk still continues to be its

principal food. This diet continues a hundred days more; and when this second period has expired it is allowed to eat grass, and feed on barley; receiving every evening, along with that provender, a bucket of camel's milk, should the tent happen to be well supplied with it. The *Nejed* Arab gives his colts neither barley nor wheat, but nourishes them with a paste of dates and water; and sometimes to a favourite he will give the fragments or leavings of his own meals. In that province horses are regularly fed upon dates; at *Derayeh* and in *El Hassa* the dates are mixed with *birsim* or dried clover. The wealthier classes often give them flesh, raw as well as hoiled; and sometimes before the commencement of a long journey they get roasted meat, that they may be better able to endure the fatigue. A native of *Hamah* told *Burckhardt* that, in order to prevent a favourite horse from falling into the hands of the governor of that town, he fed it for a fortnight exclusively on roasted pork, which excited its mettle to such a degree that it became absolutely unmanageable, and could be no longer an object of desire to the avaricious functionary. In *Egypt* vicious horses are cured of the habit of biting, by having a leg of mutton presented to them newly taken from the fire; the pain which the animal feels in seizing the hot meat with its teeth teaches it in a few lessons more gentleness of temper. The Arab steed, like its master, is accustomed to the inclemency of all weathers. During the whole year they are kept in the open air, being seldom tied up under the tent, even in the rainy season. The *Bedouins* never rub or clean their horses; but take care to walk them gently whenever they return after a ride. They generally rest in a standing position, and have been known to remain on their legs for years in succession, without lying down. Yet with so little attention to health they are seldom ill. The most prevalent diseases are the gripes, farcy, warbles, surfeit, jaundice, strangles, mange, broken wind, and watery swellings upon the stomach. Burning is the most general remedy. To cure the strangles they rub the tumours with a paste made of barley chaff, and butter; at the same time the smoke of a linen rag dyed with indigo is inhaled up the animal's nostrils, which occasions a copious discharge. In cases of surfeit they bleed the horse's feet, and wrap the skin of a sheep newly killed round its body. They have no use for farriers, except for making shoes, which are of a soft flexible iron, hammered cold, and very small, that the swiftness may not be impeded. They give different names both for fillies and colts every year until the age of four.\* In general they do not allow their mares to breed until they have completed their fifth year; but the poorer class sometimes wait no longer than the fourth, as they are eager for the profits arising from the sale of the foals. The colts are usually ridden after the completion of the second year, and from the time they are first mounted the saddle is but rarely taken off their backs. In winter a coarse sackcloth is thrown

\* So extremely accurate are the Arabs in every thing relating to their horses, that they have invented appropriate names for distinguishing the several competitors in a race, according to their respective merits. Instead of saying the first, second, third, &c. as we do, they call the foremost the *outrunner* of the *outrunners*: the next the *back-presser*; the third the *tranquillizer*; and this distinction they continue as far as the eleventh.

over them, and in summer they stand exposed to the mid-day sun. Their saddles are of wood, covered with Spanish leather; but they have no pommels, instead of which they make use of stitched felt. The stirrups are very short, with flat square bottom, and sharp-pointed corners, which answer the purpose of spurs; the slightest touch makes the animal fly off like the wind, while the rider bears himself upon the stirrups that he may use his lance with the greater vigour. When not employed in war or travelling, they loiter about the tents, often going over heaps of children lying on the ground, and carefully picking their steps lest they should hurt them. They will allow themselves to be kissed and toyed with, or hugged round the neck, without doing them the smallest injury. The different colours of Arabian horses are clear bay (*ahmar*,) brown bay (*adhem*,) sorrel (*ashkwar*,) white (*abiad*,) pure grey (*azrek*,) mottled grey (*raktha*,) bluish grey (*akhdar*,) black (*udhem*,) and dark chestnut (*ulmar mukruk*:) black and light bays (*aswad* and *ashehab*,) are unknown in Arabia, and only found in Persia, Tartary, and Turkey.

In general these horses are of a middle size, of a slender delicate shape, light and active, rather lean than fat, but of surprising swiftness, and accustomed to the fatigue of long marches. They have small ears, little belly, and a short scanty tail. They are almost invariably free from apparent deformities, and so gentle that women or children may manage them. The physical qualities which the Arabs prize most in this animal are the following:—Neck long and arched—head small—ear tapering and almost meeting at the points—eyes large and full of fire—lower jaw thin—muzzle bare—wide nostrils—belly not too broad—sinewy legs—hoofs hard and ample—chest broad—rump high and rounded. Whenever the three beauties of head, neck, and rump are found combined, the horse is considered as perfect. There are several particular marks or natural signs which the Arabs regard as sinister and unfavourable; while others are esteemed the reverse, and capable of producing happiness to the owner. They reckon above twenty evil indications; but the only bad effect they have on the animal is that of depreciating its value by two-thirds or more. The Persian and Turkoman horses, whose figures are much alike, differ from the Arabian in this, that they are more corpulent, and their coat is not so soft to the touch. It is, moreover, an opinion pretty generally received in the East, that the latter are specially distinguished from the others by the repugnance they evince towards clear water; whilst that which is turbid pleases them to such a degree, that they never fail to prance about in any that happens to come in their way. The price of Arabian horses is variable, and often depends much on the caprice of the buyer and seller: in Syria, it fluctuates from 10*l* to 120*l*. A good mare can scarcely be obtained under 60*l*; and even at that price it is difficult to purchase one, as the Bedouins always prefer the female to the males for riding, because they are not accustomed to neigh, and thus expose them in their ambuscades to the risk of detection. For a celebrated mare a sheik will often pay 200*l*; sometimes the price has amounted to 500*l*, and even to 800*l*. The favourite mare of Saoud, named *Koy-raye*, which he constantly rode on his expeditions, was purchased from a Kahtan Bedouin for 1500 Spanish dollars. Kinneir states that 1200*l* was refused for a mare at Aleppo. At Bussorah, where

they form an important article of trade with India, the average price is about 300 rupees, though the cost is thrice, or even five times, as much at Bombay or Calcutta. Over all Arabia, as also in Egypt and Syria, horses are possessed by several owners in partnership: each is divided into a number of shares (*kerat*,) of which several may be purchased by a single individual. If an Aeneze has a mare of remarkable breed, he seldom or never consents to sell her without reserving one-half or two-thirds for himself. The ownership of the progeny is regulated by special contract: the fillies of the first or second years belong to the seller; those of the subsequent years become the property of the buyer. This contract is called "selling the mare's belly;" and in this manner most of the Arabian mares are held in joint property. Sometimes the dam and her offspring are disposed of in equal shares; or on condition that the booty shall be equally divided between the original owner and the man who rides her. As the Bedouins are ignorant of those frauds by which a European jockey deceives his customers, a stranger may take a horse on their word, on first sight or trial, without much risk of being cheated. Niebuhr alleges that no instance of false testimony was ever given in respect of the descent to a horse,—the Arabs being persuaded that they and their families would be cursed should they prevaricate in giving an oath on a matter of such consequence; but the modern Arabs do not scruple to tell falsehoods if they find they can make a better market by it. The affectionate terms in which families live with their horses, will sometimes occasion extreme regret when they are obliged from necessity to sell them. D'Arvieux mentions a Syrian merchant who cried most tenderly while caressing his mare, whose genealogy he could trace for 500 years. Rubbing her with his shirt-sleeves, and wiping her forehead with his handkerchief, "My eyes," he would say to her, "my heart, must I be so unfortunate as to have thee sold to so many masters, and not to keep thee all myself? I am poor, my antelope; but I have brought thee up like my child: I never beat nor chid thee: God preserve thee, my dearest, from the looks of the envious; thou art pretty, thou art sweet, thou art lovely." It may be remarked, that the Arabs have great faith in certain superstitious charms, which they suppose will protect their horses from accidents. They use talismans written on a piece of triangular paper, which are put into a leathern purse of the same shape, and fastened round the animal's neck as a defence against witchcraft from unlucky eyes. A couple of boar's tusks, joined at the extremities by a silver ring, is suspended from their mane, to keep them from the farcy. Though the Arabs justly boast of their horses, it is a common error that supposes them to be very abundant in that country. In the Sacred Writings, and down to the times of Mohammed, they are seldom mentioned; camels being mostly used both in their warlike and predatory excursions. The breed is limited to the fertile pasture-grounds, and it is there only that they thrive; while the Bedouins who occupy arid districts rarely possess any at all. In Nejed they are not nearly so numerous as in the rich plains of Syria and Mesopotamia. In Hejaz they become scarcer; and thence towards Yemen they become fewer still, both the climate and pasture there being reckoned injurious to their health. In the district of Gebel Shammar there are many encampments that possess none at all; in Medina there are none, and in Mecca

there are perhaps not more than sixty in the possession of private individuals; so that the estimate of Burckhardt is perhaps correct, when he affirms that from Akaba to the shores of Hadramaut, comprising the great chain of mountains and the western plains towards the sea, the amount of horses is not more than 5000 or 6000; while the aggregate number in the whole peninsula does not exceed 50,000,—a number far inferior to what the same superficial extent in any other part of Asia or Europe would furnish. The rich pastures are not only stocked more abundantly, but likewise produce the finest and most select race. The best *Koheyls*, of the *Khomse*, or noble breed, are found among the Aenezes and the Rowallis in Nejed and the Hauran, towards the Euphrates. They are not all of the most perfect or distinguished quality; and perhaps not above five or six in a whole tribe deserve the name of first-rate in respect to size, bone, beauty, and action. But still their numbers are considerable; each of which may be bought, if purchased in the Desert, at from 150l to 200l. Taking the comparative excellence of the different races on an average, Nejed is generally reckoned to produce the noblest; Hejaz, the handsomest; Yemen, the most durable; Syria, the richest in colour; Mesopotamia, the most quiet; Egypt, the swiftest; Barbary, the most prolific; Persia and Koordistan, the most warlike.

In perusing the following account of the Arabian horse from Commodore Porter, let the reader bear in mind, that it originated at Constantinople, and was at length wafted to us from the Western Hemisphere: it has been a traveller, and some parts of it certainly approach the marvellous. However, as it will give variety to a subject upon which much has already been said in various publications, (generally by persons ignorant of horseflesh) we hesitate not to give it place in our columns.

#### GENUINE ARABIAN HORSE, HOW DISTINGUISHED.

The following, on the subject of the Arabian Horse, we copy from a late Number of the *American Turf Register*. It is an extract of a letter from Com. PORTER, our Chargé d'Affaires at Constantinople, to the editor, and describes the mode of distinguishing the genuine Arabian. There was one in this city a few weeks ago, which was found to possess many of the points mentioned in the Commodore's description, though otherwise as ugly and ill-formed a horse as can be well imagined.

"About a month since I saw a singularly beautiful light chestnut horse, standing in my yard; no one was holding him. His bridle was laying over his neck, and the person having charge of him was standing behind him, plaiting his beautiful long silky tail, which trailed on the ground. He appeared to be full of life, spirit, and intelligence, and as docile as a dog.

"There was something so fascinating in the appearance of this animal, something so gazelle-like, that I was determined, if he was for sale, to purchase him, *coute que coute*. His age I ascertained to be a little over seven years. He had come from the city of Sulimanich, in Koordistan, which is a province bordering on Persia on one side, and on the other side by the Pachalic of Bagdad, which latter borders on the Great Desert

of Arabia. The horse belonged to an Agha, who had recently arrived from thence: he said the horse was a little sick, and would not eat; and that as the Agha was compelled to return immediately, he had offered the horse for a sum which no one, knowing the value of a Koordistan horse, could refuse to give. I finally closed the bargain for the horse, adding a present of two hundred and fifty piastres to the groom. After trying the horse under the saddle, and approving of his gaits and fleetness, I sent for the Sultan's farrier, who, the moment he saw the horse, pronounced him not only a pure Arabian, but a beautiful one, and said that he had seen but one so pure before in his life.

"I now sent immediately to the Agha, to request him, if in his power, to give me the pedigree of the horse; he sent me word that he did not know the pedigree, nor did the person from whom he bought him; that the Koords, when they stole a horse, stole only the best, and did not stop to inquire after the pedigree; but if I wished to satisfy myself that the horse was of the pure Arabian breed, I must examine his neck, on both sides of which I should find a beautiful natural tree projecting upwards from halfway down the neck, and that I should find spurs on his fetlock joints, both of which were certain indications of the purity of his blood.

"About half-way down his neck, a few inches from the mane, on both sides, I found a dark spot, rather larger than a duck-shot, destitute of hair; but around these, to the size of a dollar, the short and silky hair made several eccentric turns, then shot up towards the ears in the form of an ostrich plume; nothing can be more beautiful.

"On examining the fetlocks, I found that he had on each of the fore a spur of two inches long, of the size of the little finger at the root, gradually tapering to a point, and turning up like those of a cock. On the hind fetlocks were the same, but not more than half the length; all were slightly fringed about the root, with soft silky hair.

"On being satisfied of the value of this horse, which circumstances had placed in my possession, I told the doctor to go to work and cure him, if possible. He felt the pulse of his legs, then examined his mouth, and felt his ears, and turning to me, said he had the *guenz keniack*, which when translated, means the *eye bone*, or *bone eye*. Never having heard of such a disease, I asked him what it was: he thrust his finger into the lower part of the horse's eye, and turning the lower lid wrong side out, desired me to feel of it. I did so, and felt a hard bony substance; the lid was much inflamed. He now thrust a needle with horse-hair through the black rim of the inner lid, and pulling out the eye, cut therefrom the bony substance. The eye bled perhaps a half-spoonful; he performed the same operation on the other eye; after which he blew up each nostril, through a short reed, about a spoonful of burnt alum and black pepper, which brought on a violent sneezing. He then directed that some garlic, vinegar, and salt should be mixed with a kind of red earth, which had the appearance of red ochre, and that his mouth should be washed with it three or four times a day, for four or five days; he next scarified his mouth, and put him into the stable. We have followed his directions, and the horse, that for a long time past would not touch barley, now eats it freely, and is to all appearance well.

"This disease, and the mode of treatment, is to

me altogether new—it may not be so to others. From the inquiries I have made, I am satisfied that in ten days more, the horse would have been ruined—the farrier said he would have been in five. The disease, it is said, is brought on by straining their eyes in anxious watching for their food. A Turkish horse is doubled-haltered to both ends of his trough, so that he cannot turn his head, which, of course, brings a great strain on the eye when he wants to look on one side or the other.

“I have measured this horse from the shoulder to the ground; he is exactly four feet nine and a half inches high (fourteen hands one and a half inches high). Those who know Eclipse, say that this horse is a highly flattering likeness of him. I shall keep the horse, although I have been strongly advised to send him to America; but I am apprehensive it might turn out like many—nay, I may say all—such speculations. But if you know of any one who wishes this horse, they may write to any disinterested person in this country to examine and report on him, and then we will agree on the terms.

“I am now satisfied there is not another Arabian in Constantinople; the Sultan's horses are generally spotted, very fat, and very spirited; they look extremely well with their trappings on; but I am assured that he has not a pure Arabian among them.”

Many persons have visited Arabia, and as the horse formed the most interesting characteristic of the country, so those who have given accounts of their travels through the medium of the press, have uniformly made the present subject a prominent feature of their publications. But, as it requires considerable practical experience before a person is capable of forming anything like a correct opinion of this elegant quadruped, and the writers not possessing the requisite knowledge, it has unfortunately happened, that the descriptions which have thus reached us, though substantially true, are disfigured by many improbable and erroneous episodes, as well as with numerous distorted facts. We have never yet met with a writer on Arabia, or those countries where the Arabian variety of the horse is found, who was capable of describing him in a proper manner—who could give his points, &c., from the eye of a well practised observer. Hence have arisen many false notions and much absurdity. Even Bruce, though he professes to have been a very superior equestrian, evinces the most egregious ignorance upon this subject in the trifling information which he has attempted to convey to his readers. However, the animals whose portraits embellish our present number, we saw, and we write what we have to say from careful observation.

Through the prompt and condescending politeness of Colonel Wemyss, we obtained permission to view his Majesty's newly-arrived Arabians: for which purpose we reached Hampton Court on Wednesday morning, April 6, and derived a high gratification from the opportunity thus afforded of looking these interesting strangers well over.

Up to this period, we had entertained

doubts as to the existence of a *black* Arabian horse. It is true, Smolensko was denominated a black; but on a close examination, the number of white hairs intermixed in his coat, constituted him, strictly speaking, a dark grey. Sir Hercules, though called a black, was evidently a dark grey. We have more than once seen black racers, certainly; but yet we thought the colour must be derived from the baser breed originally used in the cross. However, all our doubts have been dissipated; as the animal whose portrait appears in front, (in the engraving) is not only a black Arab, but a genuine horse of the very highest class: indeed, it may be said he has been bred too fine; that is, he has been produced from a stream so long continued unmixed in the same family, that though he shows as much breeding as possible, he has suffered in bulk and strength.

The head of this black Arabian is remarkable for the elevation and capacity of the nostrils, as well as for that general beauty of its form which so pre-eminently distinguishes the horse of the Desert. However, this animal is not, as the papers represented, absolutely destitute of white: on the contrary, he has two white feet, one before, and the other behind, with a little white in his face. What ever might have been our previous incredulity respecting the existence of a genuine black Arabian horse, we now feel satisfied that the horses of Arabia are varied in colour much in the same manner as our racers and our horses of superior breeding: indeed we have seen grey, chestnut, bay, brown, and black.

The black Arabian under consideration is a well formed horse, whose *tout ensemble* reminded us of the celebrated Dr. Syntax, (bred by the late Mr. Ridsdale, and winner of more gold cups than any horse which ever appeared on the turf,) particularly in his hind quarters. His pasteris were uncommonly long, the effect of his blood having been too long continued on the same strain. Such a formation may be, and undoubtedly is, favourable to speed, but must very much weaken the part, and render the animal very liable to break down. Like all Arabians which have fallen under our observation, his legs handled like ivory, presenting also that extraordinary development of the tendon for which this variety of the tribe is so very remarkable. Further, like the rest of these exotics, his feet were well formed; and, at the same time, he manifested a good-tempered playfulness of disposition, which we have uniformly found to be the case with all those Arabians which have fallen under our notice, and in which all travellers agree in stating to be a general characteristic. Shebdeez was, however, as vicious as possible: it was not without some difficulty, aided by the assistance of the groom, that we were able (some years ago when in possession of John Formby, Esq.,) to stand up to him. But Shebdeez, though represented as an Arabian, and presenting some of

the characteristics of the class, was not a truly bred horse: he was much larger in every respect than the genuine Arab, without the wiry elasticity of the latter: in fact, he was a Persian horse, sent from that country by Sir Gore Ouseley, when ambassador from England; and, therefore, as it is well known the Persians admire a larger horse than the genuine deer-like animal of the Desert, they are under the necessity of introducing base blood for the accomplishment of their object; but though they thus procure a larger animal, it is at the expence of activity, and, as it would appear, of good temper also. Forming our opinion from what we have seen, as well as from what we have read on the subject, we feel no hesitation in stating, that Arabian horses, generally speaking, are as remarkable for good temper as for their elegance of form, and light elastic, deer-like movements. To speak as an English fox-hunter, we should say, they cannot carry weight; and yet how admirably are they adapted for the people amongst whom they are produced. The Arab, like his steed, is sinewy, light, and elastic; and as he seldom rides more than nine stone, and frequently not so much, it may be correctly remarked, that the horse and the man are admirably calculated for each other.

The second figure in the plate is the portrait of a bay horse, somewhat larger than the generality of Arabians, being as near as we could guess, about fifteen hands high. Though considerably larger than the black horse already mentioned, he is not so handsome, if we except his quarters, which are powerful, well set in, and altogether very finely formed. He has black legs, and four white feet. He has a finely formed head, with a beautiful prominent eye; his neck is long, and not quite so handsomely fixed in the body as might have been wished; the lower part of his shoulder rather coarse and heavy; middle piece (carcase) long, loins loose: however, it must not be forgotten that these animals had endured the very narrow confinement of a ship for the tedious period of six months; they had scarcely "an ounce of flesh on their bones," and were consequently seen under the utmost disadvantage: nor have we the least doubt, when this bay stallion has acquired what is well understood by the term *condition*, that he will come under the general description of a splendid or magnificent horse.

The ears of these Arabians were larger than those of any other Eastern horses which have fallen under our observation: they reminded us of the Orville family of this country, the greater number of which were remarkable for large ears.

Portraits of the mares will be given in our next number, when we shall embrace the opportunity of offering a few observations on the re-introduction of Arabian blood into a thorough-bred horse, through the medium of the female.

## ON BREEDING AND BREAKING RETRIEVERS.

As I believe I am peculiar in my system of breaking these dogs, and as I think very successful, I beg to offer these hints to your readers for consideration. I wish the dog to be broke, to be a year and a half old, never to have fetched in his life, never to have been taught anything, of any sort; I then can to a certainty, make him the tender-mouthed dog to bring game; and if his nose and perseverance is good naturally, he will be a fine finder and a tender-mouthed retriever. I have always found those dogs who are most curly, most sagacious; that there is no one breed of dog called retrievers, no body can deny, nor I believe can a retriever be bred to a certainty; he may turn out well, or ill, although his sire and dam are first-rate, yet I would prefer getting a pup from a good sire and dam as retrievers, but particularly the dam. I am of opinion the Irish water spaniel is the most sagacious sporting dog with the highest courage, and finest nose we have, if of good blood; but like all high-bred animals, a dash of curish blood quite alters the character of the dog, either to the eye, or for use. I once had a very fine dog of this breed, of a deep liver-coloured brown, with a close short curly coat, smooth pate, and great bone; he would take my shot-bag home, get it filled, bring it back, or take it to the keeper if he was out beating a cover, get it filled and bring it back, and nothing would divert him from his purpose; if a pheasant was to fall just before him, he would take no notice at the time, but afterwards go and fetch it. Once when on the sea coast, a small, badly-formed, and leaky fishing boat, was cast on shore, on a bad reef or rocks; three men, and a boy of ten years old, were the crew; the three men swam on shore intending to see if some assistance could be given to the boy afterwards, but they got so bruised against the rocks, they were all unable to afford any themselves, and as the gale increased no person could be found to venture out in any way. I heard the noise, went to the spot with this dog: the poor little boy stood every chance of being drowned in a very short time, if something was not soon done; so I sent my dog, who went in, I must say, more like a seal than a dog, and after several fruitless attempts to mount the wreck, he succeeded, laid hold of the poor little boy, he clinging to the wreck and in the most horrid way screaming at being dragged into the water, in which he could not swim. The waves dashed on the rocks most frightfully. In the anxiety and responsibility of the moment, I thought the dog had missed him. I stripped off my clothes, resolved never to return without the poor fellow, tormented as I should ever be, with the conviction of having hastened his death, to use the mildest terms. I was just in the act of jumping in, having picked out a moment when the receding waves would have given the best chance of getting off, after having expended their fury

on the rocks, when—to express my ecstasy would be impossible—I saw old Bagsman (for that was his name) with the struggling boy in his mouth, his head uppermost. I jumped to the spot, where he must land, a sea at the right moment bore the boy and dog into my arms, without a scratch. Some spectators laid hold of me, or the wave receding would have taken us all back again. I took the boy to his father, the scene of joy was the most moving thing I ever witnessed. Poor Bagsman fell a victim while trying to save a drunken man from a watery grave. I was staying at a small cove in the west of Ireland, for wildfowl shooting, and had that day gone to a magistrate, to get a permit to buy gunpowder, without which nobody could buy a grain (ten years ago). I left my dog at home, to get a little rest from his hard work. A drunken man in a frolic, pushed off in a boat with a girl in it, the tide going out soon carried the boat out; he got frightened, could not swim, but jumped over-board. Bagsman, who was on the spot hearing the splash, jumped in, swam out to the man, caught hold of him, and brought him twenty or thirty yards towards the shore, when the drunken man clasped the dog tight round the body—the dog could do nothing; they both went down together, and never rose again. The girl was saved by a boat going to her assistance. The body was recovered about one hour afterwards, with the dog clasped tight in his arms; so it was quite evident if the dog had not been squeezed to death, he would have saved the man. Alas! poor Bagsman.

I am now going on to the breaking the retriever, as this is a subject I never saw fully described. I will now give you an instance of rather a difficult-to-be-broke dog, but who has turned out, I think, first-rate. There are several things necessary in a dog that it is intended to take the trouble to break for this purpose; and I fearlessly assert, that it will take two seasons before he is a perfect dog; other dogs require only a few months to be perfected. The things requisite are, that you should like the dog; that he should like you; that he should be so handsome, you will not get disheartened at his progressing slowly; that he should like the water; that he should run a hare or other game; that he should be size enough to bring with ease a hare over a wall, or hurdle; that he should be attentive to the word of his master; that he should not exceed two years old, nor less than one year. I decidedly object to dogs who have been taught to fetch and carry, because they are generally so hard-mouthed, they are only fit to catch rats oftentimes. I have had my game mashed to pieces when I particularly wished perhaps, at the request of some pretty girl, to get a little game for her mother's party, and when every bird is worth a world to me. Having for a certain period of my life been obliged to make all sorts of shifts, I determined no longer to do so, with a retriever. So got a fine two year old black curly Newfoundland dog, at least that is usually called so by common dog-fanciers;

he was too savage for the owner, so I gave the servant one pound for him. I put a leather collar round his neck, then fastened the collar of a pair of couples round my leg, just below my left knee, not to interfere with the gun, in my right hand. The other collar I passed round the collar on the dog's neck, and buckled it to the longest hole; here then the dog is coupled to my leg. In this way I went out shooting with him, taking care he did not tumble me over the fences, by holding him with my left hand, while fencing, and lifting him at the moment. I took out the spaniels in low cover, and hedgerows; every time the gun went off, the dog at the report tried to bolt, but could not, and trembled like an aspen leaf. I took him up to the rabbit or whatever I killed, but he would take no notice of it. I put the game in his mouth every time, held his jaws together, and made him walk about still tied to my leg, holding his mouth shut on the game, with my hand. This went on for a week, the only difference was he began to jump his fences with me quite well; he then began to smell the birds, and then I walked past them without stopping, so by degrees the dog began to lay hold of them, and by degrees having so little time to stay, he picked up the game at once, (of course I patted him constantly,) and brought it along with him. I immediately patted him, caressed him, and for the first time gave him some toast, dipped in grease, as a reward; this he liked very much indeed. About this time he began to give up all symptoms of fear on the gun going off, and began to pick up his lost flesh, this was about the 16th day; from this he rapidly advanced, when he would pick up the game at once, while fastened to my leg. When perfect in this, I began to let him go after it, and when he picked it up, I never looked at him, but walked away, calling him until I had him at my feet; then I gave him a bit of toast, and caressed him, buckling him up again to my leg; in this way the dog improved every day; he was so light-mouthed he hardly held the birds tight enough to prevent many of them escaping. As I wished him as well as all my dogs to down charge, I never let him go after the game, until I had loaded. About this time he picked up his courage, snarling at any dogs who ran up to the dead birds, &c., but as yet he did not bite them. About this time I shot a wild goose, which fell into a lake only wounded, he swam a little way into the lake, but returned without going up to it. He had always been the torment of the village ducks, now would not face a goose; it was evident a perfect change had been wrought in the dog. I ordered the spaniels in, who had up to this moment "down charged," at the word they jumped up, and into the lake, this was before Porter (for I must now christen him) had come to shore; he did not turn back, but came on shore. At this want of courage, as I then thought it, I was very disheartened, and would have given him away to any one. But mark this, those who want perseverance; the spaniels worried the

goose hard, and it kept going over to the other side, fighting well. When it had nearly got on shore, I ran round; this put Porter's courage up. When we got there, I let go the dog, he jumped in, and catching the goose by the neck, while she was in the act of aiming a peck at his eye, he proudly bore her on shore. From that moment he has hunted the water as well as the land; this was about the 25th day, but it was deep into the second season before he was steady, when he saw me knock over a bird or rabbit; that is to say, before he would stop until I sent him for it. It was a long time before I could get him to obey signals from my hand, or word of mouth, such as forward, back, to the right, to the left, with a wave of the hand, in that direction; but now he will turn in the desired direction merely by word of mouth; he is so good that I would be bound not to lose a bird of my own shooting of any sort in a season, either on land or water, in the day time; he will go 300 yards a-head in any direction, and would then work by signals from me in any direction, and find his bird. This is what I call a great trial of a retriever,—not any of your cockney dogs, going back after a stick or glove, or finding his master's hat out of twenty others. I never wish to see a retriever pick up any thing but game; although I have given an instance of one who did; but then he was one in one thousand. I do not think this dog would save a man in the water—he is too tender-mouthed—unless the man had clothes on, I do not think he would bite the flesh, although when I got him he used to kill sheep and bite any poor man or woman he could get at. This is not the first dog I have broke in this way by any means; but, as it is the last, I recollect better what I did with him. My next letter will probably be on the Irish system of breaking the Irish setter.

RED ROVER.

## THE KITE.

(FROM JOHNSON'S GAMEKEEPER'S DIRECTORY AND COMPLETE VERMIN DESTROYER.)

We now come to a tribe or list of creatures, which are as destructive perhaps to game as those already enumerated, though they seek it in a different manner: the former pursue their prey by scent—these by sight.

The kite may be regarded as the largest of the predacious birds known, or at least which breed, in this country; and it may be observed that all birds of the hawk kind are furnished with a large head, and a strong crooked beak, notched at the end, for the purpose of tearing their prey. They have strong short legs, and sharp crooked talons for the purpose of seizing it. Their bodies are formed for war, being fibrous and muscular. The sight of such as prey by day is astonishingly quick; and such as ravage by night have their sight so fitted as to discern objects in the gloom of evening with astonishing precision.

Thus formed for war, they lead a life of solitude and rapacity. They inhabit by choice the most lonely places, and the most desert mountains. They make their nests in the clefts of rocks, in trees, on the ground, in mouldering ruins, &c. Whenever they appear, it is only for the purposes of depredation, and they may be regarded as gloomy intruders on the general joy of the landscape.

They are fierce by nature, and this fierceness extends to their young, which manifest a disposition for carnage from the earliest periods. Other birds seldom forsake their young till they are able completely to provide for themselves, and are nearly full grown; the hawk tribe drives them off at a period when they should still protect and support them.

All animals that, by the conformation of their stomachs and intestines, are obliged to live upon flesh, and support themselves by prey, though they may be mild when young, soon become fierce and mischievous by the very habit of using those arms with which nature has supplied them. As it is only by the destruction of other animals they can subsist, they become more furious every day; and even the parental feelings are overpowered by their general habits of cruelty.

Another effect of this natural and acquired severity is, that almost all birds of prey are unsociable and solitary. Like the wild cat and the weasel tribe, they lead a lonely life, and are only united in pairs by that instinct which overpowers for a time their rapacious habits of enmity. Except at certain periods, they usually prowl alone; and, like robbers, enjoy in solitude the fruits of their plunder.

All birds of the hawk tribe are remarkable for one peculiarity which seems to distinguish them, not only from the rest of the feathered tribes, but perhaps from the whole of animated nature. All the males of these birds are less and weaker than the females.

The kite may be distinguished from the rest of the rapacious tribes which infest this country, by his size and his long forked tail. He appears to use very little exertion in the act of flying; and with a slow sailing motion seems for ever on the wing. As almost every bird of the air is able to make good its retreat from him, he may be said to live upon accidental carnage. He may, therefore, be considered as an insidious thief, who only prowls about, and when he finds a bird wounded or disabled, instantly seizes it, and, like a famished

ENGLAND IN 1835 (BY VON RAUMER).—Von Raumer makes some pertinent observations on what is called agricultural distress:—"Admitting that the distress exists, it however does not exist in England only, but in many of the countries of the continent. The causes therefore cannot be exclusively English; they cannot lie entirely in poor-rates and malt-tax—in the relative situation of the farmer and the manufacturer—in corn laws, &c., for the farmers and landowners on the continent who complain are little, or not at all, affected by these evils. Let us say, therefore, plainly, wherein the common error lies, and whence the similar disorder arises. Not only was a temporary state of things, which forced the produce and the prices to an unnatural height, supposed to be permanent, but people speculated even beyond this height, and bought or rented estates accordingly. And they did not only buy and rent with their own money, but with that of others, borrowed at high interest, and at the very outset ordered their household, (a mode of life in direct contrast to their ancient simplicity), as if money would never be wanting for all these extravagant expenses. Here lies the true root of much of the misery, and of the greater part of the complaints. But no legislation can avert the consequences of false speculation, nor ought it to regulate its measures according to the wishes and wants of improvident bankrupts."

glutton, is sure to shew no mercy. Kites will pounce upon young chickens, young ducks, and young geese, whenever an opportunity offers; and are very destructive to game—they not only destroy the young of winged game, but the old birds also if they can catch them, as well as rabbits, young hares, &c. I never saw them attack an old hare; though I have no doubt if they found one wounded or disabled, they would not fail to seize it.

The kite, called in some parts the glead, and the ring tail, and erroneously the goshawk, appears larger than the buzzard, but is not so in reality—it has a much longer tail, a greater expanse of wing, but does not weigh so heavy. It is of a brown-grey colour, and is altogether a handsome bird. Its sight, like the whole of the tribe, is remarkably quick; and though a bird of very slow flight, it will dart down upon its prey with the rapidity of lightning, as I have many times witnessed. It is found in woods, but more commonly seen upon forests, downs, moorlands, marshes, and fens. When shooting ducks, &c., upon marshes or fenny places, I have known these birds attend the sportsman, as it were, and if a bird happened to be so wounded as to get beyond the reach of the shooter, it was pursued and made a prize of by the kite. In fact, the kite is a general prowler, to whom scarcely any thing seems to come amiss. I have watched them for hours, (particularly on Charnwood Forest) I have seen them sail round and round a flock of geese, where there were small goslings, and watching their opportunity, they have seized one and borne it away.

However, as these birds are forever on the watch for their prey, so are they also for their enemies: as if, knowing themselves to be thieves, and that they have no friends, they will not suffer the approach of the shooter, unless by accident: and therefore other means than the fowling-piece become necessary for their destruction. They form their nest upon the ground, amongst rushes, &c., and I have known them to trim up the old nest of a crow and deposit their eggs in it. Their nests should be sought and the eggs or the young destroyed, and perhaps an opportunity may be offered for killing one or both the parent birds.

When the kite finds a covey and springs them, he is not able to catch any of the birds by swiftness of flight: he, however, pursues as fast as he can, springs them again; and after the second or third flight, the birds become so fatigued as to fall an easy prey.

To secure this marauder, set a few traps in his regular beat, baited with a small rabbit or a bird, and he is sure to be taken. In champaign countries, *bird bushes* should be made half-a-mile asunder: what is meant by this expression is, a large stake is to be driven into the ground, and left seven feet high:—bushes and boughs are to be laid round this post, and kept hollow at the bottom to the extent of ten yards, for the partridges to run under. Many coveys will be driven into these bushes by the kite, who will fly round the bushes for a few turns and then alight on the post, where there must be a trap let in ready to receive him.

There is no better trap than the common warren iron trap:—it should be about eight inches square, not round; as a square trap will catch with much more certainty than a round one. For the kite set the trap against a bush which extends a little, so that you may place the end of it against the bush, and that the trap may be somewhat flanked by the bush, that he must walk on to it.

Bury the trap lightly, and fasten a piece of bullock's lights, a piece of rabbit, or almost any thing of a similar kind, not to the bridge of it, but beyond it, so that he may walk on the trap; then scatter about two handfuls of feathers round and over the trap; the feathers will allure him down from a great height, he supposing some bird lies there killed.

BEES.—Mr. Savage writes—"After thirty years close attention to, and practical experience in the cultivation of Bees, as one result of the lengthened acquaintance with the habits and wants of these indefatigable insects, I have invented an improved hive, which I trust with good grounds, may justly be denominated *The Preserver and Remunerator Hive*, and which several experienced apiarists, (to whose testimonials I could refer) have considered that it would require no mean effort of ingenuity, to point out any material improvement. It is so truly simple in its construction and arrangement, that any way-faring man, or industrious cottager, may most easily comprehend its utility and management. The hive is composed of wood and glass, and necessarily requires to be well framed and put together, and if neatly painted, or grained to imitate any fancy wood, will form a handsome ornament to the apiary, nor will it confer any disgrace upon the drawing room of the more distinguished amateur. From its singular structure it is admirably adapted (at that particular season of the year which is most favourable for the diligent cultivation of these interesting pursuits) to afford the greater facility for the study of the internal economy, and equally so of the wise laws which regulate the well ordered commonwealth, that it not merely contains, but unfolds and displays to the eye of the admirer in every progressive state. Another most important advantage is, that from the peculiarity of its formation, every particle of superfluous honey may be easily abstracted at the precise moment that may be fixed upon, without the necessity of destroying so much as a single bee; neither is it possible that the parent stock belonging to the hive can be unjustly deprived of the sufficient store that they have there deposited, either for their more immediate or winter sustenance. Such also is the extra accommodation afforded, that the bees, instead of being compelled to remain idle for want of space, can continue their labour during all parts of the season, that may prove suitable for the in-gathering of honey, and though they work unceasingly, will always find capacious receptacle for the produce of their industry; and it is a well known fact, that honey gathered rapidly, (very often in a few weeks) is of a more pure and delicate nature, and essentially of superior quality, to that which is collected and crowded together in the common hive.

POA NERVOSA OR HUDSON'S BAY MEADOW GRASS.—We have to direct the attention of our agricultural readers to a new grass of this name which has been brought to successful cultivation by Mr. Bishop of Methuen Castle. A specimen was exhibited in Mr. Turnbull's seed shop last Friday, mown off cold damp land, averaging 18 to 20 inches length of stem, showing all the freshness and verdure of midsummer. From an examination of the plant much of its value seems to arise from a very singular property it possesses, which is common to no other grass cultivated in this country, viz.,—that of the flower stem, after being cropped, reproducing from the stem as well as the root. By this means it reproduces its waste the whole season throughout. Nor are its properties for winter pasturage less valuable, as the remainder of the plant, unconsumed in summer, continues filled with nutritive matter under the greatest severity of winter.—Mr. Bishop is well known as a successful cultivator of new grasses, and we have no doubt this new variety he has introduced, will be of the greatest service to the graziers, as well as agriculturists in general.—*Perth Courier*

## CAUTIONS ON TILE-DRAINING.

SIR,—As tile-draining for agricultural, as well as for other purposes, seems to be coming into general use, I am desirous of suggesting, through your paper, a few cautions to such persons as may be disposed to adopt the practice; which, if attended to, may save them from much disappointment and unnecessary expense, and also be the means of preventing a most valuable improvement from falling into disrepute, through imperfection in the mode of executing it.

It may be right to premise, that the following remarks are not intended to apply to drains cut in land abounding in springs, and where, consequently, there is reason to expect that constant streams will be running through the drains, even in the driest season of the year. For land of this description the present practice may be sufficient, and may require no material improvement. But where the springs, if any, are so weak as not to insure at all seasons a constant flow of water through the drains, or where the superfluous moisture which is to be drained off is nothing more than rain water fallen on the surface, and prevented penetrating into the earth by a retentive sub-soil; in these cases, which comprehend a large proportion of the land of this kingdom, the drains which are cut, though in full operation, and pouring out abundant streams of water during the rainy season, will gradually cease to flow in the spring, and, as summer advances, will become perfectly dry; and these are precisely the circumstances which require from all persons engaged in tile-draining, who look to the permanency of their improvement, a much greater degree of care and attention than appear hitherto to have been bestowed upon the subject.

In draining all soils, with the exception above mentioned, namely, where there are perennial springs, the principal point to be attended to is this,—*on no account to trust to arched tiles alone*, but always to place flat or bottom tiles under them, taking the greatest care, in laying them down, that the tiles of both descriptions unite as closely as the usual unevenness of their edges will allow; so that, though ample space will be left for the water to find its way into the hollow of the drain, by means of the interstices occasioned by this unevenness, every thing which may obstruct the free passage of the water through that hollow will be effectually excluded.

It is true, that for a long time past flat tiles have been occasionally employed in draining; but their chief use does not appear to have been understood, and consequently has not been insisted upon even by writers of great intelligence and experience. Mr. Loudon, for instance, in his "Encyclopædia of Agriculture," No. 4,286, seems to consider the principal, if not only, use of flat tiles in draining to be to serve as supports to the arched tiles, and prevent their sinking; his words are, "In very loose soils plain tiles are wanted to place the draining tiles on; in other soils, old broken pieces of plain tiles are sufficient for the ends to rest on." Mr. Howard also, in his able and instructive "Report of Farming on the estate of Scoreby, in Yorkshire, published under the Superintendance of the Society for the Diffusion of Useful Knowledge," has an observation to the same effect:—"In some places (he says), where the land is particularly springy, and inclined to bog, it is necessary to lay down flat tiles as a foundation, to prevent the drain tile from sinking; but this is often found needless, and there are usually a few broken tiles

ready to be applied to any suspicious parts." That Mr. Howard was aware, however, that there may be another use for these flat tiles, besides that of preventing the sinking of the arched tiles, is evident from a remark immediately following the passage now cited. "Where the flat tiles," he adds, "are used, the great enemy to under-drainers, the mole, is effectually prevented from doing mischief."

I now proceed to state the circumstances which led me to discover the absolute necessity of carefully attending to the caution above mentioned, in order to guard against the injuries which may otherwise be occasioned by this great enemy to under-drainers.

In the year 1827, having determined to drain a few acres of land which had recently come into my possession, I was induced, in consequence of the difficulty of procuring stone, to make use of arched draining tiles, which I had seen employed for that purpose in Shropshire, and some of the adjoining counties, but which had not at that time made their way into the district in which I reside. I accordingly gave the plan and dimensions to the proprietor of a neighbouring brick-yard, and soon obtained the quantity I wanted. As a security against the *heavings* of the mole, which I had observed to be frequently very injurious to the open gutters in our watered meadows, I had flat roofing tiles laid along the bottom of the drains, and upon them deposited the arched tiles. A quantity of bean haulm was then placed upon the tiles; and, for want of stones, which would have been preferable, a layer of the same haulm, three or four inches thick, was set upright against the *upper* side of the drain; that is, the side next to the higher part of the field, and through which the water enters the drain, and held in that position by a boy pressing against it with the head of a rake, whilst a man returned the vegetable mould on looser materials into the drain. The retentive clay, which formed the subsoil, was left to be carted off.

For various reasons, I had made choice of a dry season of the year for this operation, and during the progress of it, and for some time after, there was scarcely a drop of water seen to issue from the drains. But when at length we had a heavy fall of rain, I was naturally anxious to ascertain whether a practice, which was then quite new to the district, was likely to answer; and, upon proceeding to the spot, I was much gratified to find that the mouth of every drain was pouring out a considerable stream. This continued for several days; at the end of which, as no more rain had fallen, the streams gradually diminished; and, at last, entirely ceased; and I had the pleasure to see the ground soon become dry and firm, which would not have been the case, before the drainage, in less than a month; and, probably, if there had been frequent falls of rain, not during the whole winter, nor till late in the spring.

My drainage had been completed before the middle of September, 1827, and nothing could succeed better than it appeared to do during the whole of that autumn and following winter; and I was led to infer from the dryness and firmness of the ground, and the improvement in the herbage, that I should have an ample return for all my expenses. In the succeeding autumn, however, I experienced a severe disappointment. On visiting the field, about the middle of November, after a heavy fall of rain, I was surprised to observe that scarcely any water flowed from the mouth of one

of my drains, whilst the water was running from the other as abundantly as in the preceding autumn and winter. In the course of a week, no rain having fallen in the mean time, all the other drains ceased to flow, and the grounds below them became dry and firm; whilst that which was below the drains in question, out of which there still oozed the same trifling and scarcely perceptible stream as before, remained nearly as wet and as soft as it used to be at the same season of the year before the drainage.

The great object now was, to endeavour to ascertain the cause of my present disappointment; and whether a remedy might not be devised. Upon opening the drain, the cavity within the tiles was found, as I expected, full of water: but we had not been so fortunate as to light upon the place where the obstruction was: after one or two more trials, however, we came upon the source of the mischief. One of the arched tiles was found to be entirely filled with clay, rammed in as closely as could have been done by the human hand with a ramming stick; and the consequence was that above this artificial dam, the drain was full of water; whilst below, between the dam and the mouth, the drain was almost dry. Having allowed the water to flow off, which had been so effectually dammed back, I was enabled to discover by what engineer this work had been constructed, with a sagacity exceeded only by that of the beaver. It proved to be the mole, which had taken advantage of a corner of one of the flat tiles having been accidentally broken off, by which a communication was rendered practicable between the interior of the drain and the earth without. Through that cavity, barely large enough to admit the passage of its body, it had drawn in the mass of clay which filled the arched tile. From this ascertained fact, and there could be no mistake, as the hole of the mole was found immediately under the broken part of the tile, it appears that this animal is accustomed to take possession of hollow drains during the dry season; but when, at the commencement of the rainy season, the drains begin to work freely, its instinct teaches it to secure itself against the impending flood, by drawing in a quantity of earth or clay through any opening that may occur in the materials of the drain, and therewith forming a dam so nicely fitted to the cavity, and so closely rammed, as to be altogether impervious to water.

It has been mentioned before, that flat tiles were placed at the bottom of the drains, with a view to prevent the injuries to be apprehended from the *heavings* of the mole; but I had no apprehension of any such operation as that which has now been described; and, of course, had not provided against it. When once discovered, however, the remedy was obvious; namely, to leave no openings in the whole course of the drains, except those which are afforded by the roughness and unevenness of the edges of the tiles. Accordingly, having occasion to drain another field in the spring of 1829, I directed some tiles to be made, both arched and flat, which might prevent the recurrence of a similar inconvenience; and, after a trial of seven years, I have never seen the slightest appearance of obstruction in any part of the drain.

There were some other remarks relating to this important subject, which I was desirous of communicating; but, feeling that I have already trespassed too much upon your columns, I must now conclude. I am, sir, your obedient servant,

*Near Bridgwater.*

P.

## APPLICATION OF STEAM TO AGRICULTURE.

PATENTS OF JOHN HEATHCOAT, ESQ., M. P.

The following is a brief description of Mr. Heathcoat's Patents for his invention of "new or improved methods of draining and cultivating land; and new and improved machinery and apparatus applicable thereto—which machinery and apparatus may be applied to divers other useful purposes:"—

These patents were obtained for England, Scotland, and Ireland, in 1832. Prolonged and costly experiments have been required to mature the invention, and adapt it to practical use as a substitute for animal labour in many expensive agricultural processes, particularly in the culture of wet, heavy soils. Its first application has been made to the reclamation of bogs, which of all descriptions of soil, offer perhaps the greatest natural obstacles to improvement by mechanical means. These obstacles are, however, effectually overcome. Various machinery, constructed expressly for the cultivation of bogs, has, for some months, been practically and successfully worked in Lancashire on a bog called RED MOSS, near Bolton-le-Moors.

The principal machine is locomotive, and is so contrived as to be capable of travelling on the surface of bogs, the consistence of which would be insufficient, previous to a long and expensive drainage, for sustaining the weight of horses. The moving power is steam, generated from the peat and water of the bog itself. The diggings from the drains furnish abundance of fuel; and the drains yield an unfailling supply of water.

The prime agent, steam, is thus obtained at the cheapest possible rate; the local fuel requiring no transport, and the water no outlay in reservoirs or other constructions, to ensure a constant provision. By far the greater part of the power of the engines fixed on the machine is available, and employed to actuate the ploughs or other agricultural implements. These are moved at right angles to the line of progress of the machine, not dragged after it; the machine itself remaining stationary whilst the ploughs are at work between it, and two small auxiliary carriages, in the manner to be presently described.

In commencing the reclamation of a bog, a roadway is to be first traced out in a suitable direction for the proposed operations. This is done simply by forming two drains parallel with each other, and about seven yards apart. The principal machine is launched on this roadway. No metal or material of any sort is necessary to solidity to it; the machine rests on the raw bog, and bears on so large a surface of it that its buoyancy is insured. It also consolidates and dries the roadway by its pressure.

The two auxiliary carriages are stationed (where space permits), at a distance of about 480 yards asunder; one on each side of the principal machine, and parallel with it. Each carriage is furnished with a large wheel, or pulley, round which a band passes, proceeding from, and returning to, the principal machine, whence it derives its motion by proper apparatus. These bands are connected with the ploughs, or other agricultural implements, which are drawn to and fro between the machine and the auxiliaries. One quarter of a mile of land in breadth, exclusive of the roadway and headlands, is thus operated upon on the two sides of the machine. The auxiliary carriages travel on four wheels, resting on planks, which form a moveable railroad. One of the planks is let into a shallow trench cut in the bog, against one side of which plank some friction rollers, fixed on the

carriage, press in order to resist the pull of the engines.

Ploughing is the first agricultural operation. To accomplish this process in a thoroughly mechanical manner, and to adapt it to steam power, it has been necessary to contrive peculiar ploughs, furnished with sharp working knives, which divide every root and fibre of the bog plants, to the depth of nine inches, and turn over a furrow slice of eighteen inches in breadth, completely reversing the surface, and turning the heather side downwards. The underlying heath, moss and other bog-herbage facilitates the discharge of water, and permits the rain and air to penetrate the furrows. Drains are formed as the ploughing proceeds, that the vast quantities of water liberated by that process may be immediately carried off. After lying a few months in this state, exposed to the action of the atmosphere, the ploughed surface is found to be so considerably pulverised, that little remains to be done to fit it for the reception of grass-seeds. The complex operations necessary to prepare the soil for the culture of other and more important crops than grasses, will also be materially simplified and economised by awaiting the natural decomposition of the soil, which is so greatly expedited by this system of ploughing as a first process. It establishes a general under-drainage, which, with the assistance of numerous shallow gutters discharging into proper drains, will speedily create a soil on the surface of the wettest bogs.

The machine and auxiliaries remain stationary during the time occupied by the ploughs in taking two furrows; they are then, severally, put in motion, and made to advance in three parallel lines, in order to keep pace with the breadth of land turned over, and to pull the ploughs accurately straight. The machine is impelled by the engines, and each auxiliary by its attendant man, who also shifts on his planks as occasion requires. The machine and its auxiliaries have thus to be moved over a space of eighteen inches only, whilst the ploughs have travelled 40 yards, and turned over 220 square yards of land nine inches in depth; in other words, the machine and auxiliaries have to be moved only eleven yards, in the time that the ploughs have travelled five and a half miles, and turned over a statute acre of land. The ploughs perform their work at the rate of two miles an hour, and are subject to very few stoppages; so that eight acres and three quarters, nearly, of bog would be ploughed up in a day's work of 12 hours, or, taking the average of daylight throughout the year, and making a liberal allowance for hindrances from weather and other causes, one machine would plough up 2,000 acres in a twelvemonth.

It is evidently impossible to state, with any approach to accuracy, the expense of draining bogs, as the number, nature, and dimensions of the necessary drains vary with the wetness, retentiveness, and other qualities of each particular bog. The cost of draining will be materially reduced by applying steam power to suitable draining implements. In like proportion the expense of all other processes in husbandry will be diminished. The power of the engines will be used in conjunction with portable railways, for the conveyance of marl, and other kinds of manure or manuring soils, on the land. By these means, proper times and seasons can be selected for performing the various farming operations, the poaching (or injuring from the treading) of horses will be entirely avoided; open drains, where preferable, may be substituted for covered ones; and no outlay will be required for roads. The land necessarily lost by farm roads and communications between

fields will be, consequently, saved to the occupier and the public, as the machine roadways will be laid down with grass, and thus become permanently productive, instead of being not only a positive loss, but a source of continual expense and trouble.

That the steam-engine would at no very distant day, supply the place of animal labour in agriculture, and become as mighty an instrument in augmenting the productiveness of the soils, as it has proved in creating and economizing manufactures, in navigating the ocean, and in travelling on land, was many years predicted by Franklin—a prediction reiterated by Davy, and, latterly acknowledged and enforced, as a great desideratum in science, by many distinguished agriculturists. The successful application of Mr. Heathcoat's invention to the culture of bogs—the most repellent and obstinate of waste lands—leaves no room to doubt of its applicability to soil all ready in cultivation. Coals are now procurable throughout Great Britain at prices which have caused the steam-engine to be extensively introduced as a substitute for animal labour in many of the processes connected with agriculture. Thrashing, cleaning, and grinding corn, hay-chopping, turnip-slicing &c. are now performed by small engines fixed on farm premises, even the churn has its steam-engine, managed by the dairy maid; and so great is the advantage arising to the dairy farmer from the regularity of motion, and economy produced by it, that hundreds of small engines, for this similar purpose alone, are used in the north of England and in Scotland. But these are humble savings compared with the benefit to be derived from the vast steam power which may be brought to bear on the soil itself. Those agriculturists who are acquainted with the effects produced by the valuable sub-soil plough, recently invented by Mr. Smith, of Deanston, will readily appreciate the importance of an invention which will enable him to employ that kind of plough at a much diminished cost per acre. Mr. Smith's plough, with steam power, will effect a revolution in agriculture. Implements of husbandry have hitherto been restricted, in form, weight and dimensions, to the powers and manageableness of a team of horses. A new class of instruments will take their place; the stiffest soils may be broken up and pulverized to any desired depth; strong clays, the natural wheatlands, may be profitably cultivated, rendered more fertile, and fitted to bear a better and more systematic rotation of crops.

Such are a few of the benefits which landowners and agriculturists will derive from the substitution of steam for animal power in husbandry. It is also no slight advantage, in a national point of view, that this important change will be effected, unaccompanied by any of those temporary evils which too frequently attend the application of mechanical discoveries to existing arts. This invention will not displace a single human being from his accustomed healthy occupations; it will on the contrary, occasion new and increased employment for agricultural labourers—it will restore to the support of man a considerable portion of that large amount of produce now sacrificed to the maintenance of agricultural horses—it will furnish employment to the rapidly increasing rural population of the empire, by rescuing millions of acres of bog and waste land from obnoxious sterility—it will fix on their native soil multitudes of those poor Irish labourers, who annually migrate to Great Britain in search of work and food, and who are forced, with numbers of our countrymen, to suffer the hardships and dangers inseparable from emigration to wild and distant regions.

## STATE OF COMMERCE.

On looking into commercial affairs with the view of ascertaining what the prospects for the country are at any particular period, one of the greatest difficulties in the inquiry arises from the impossibility of ascertaining what effect may be produced upon speculation and enterprise by the measures of governments or by military preparations. Tranquillity having remained undisturbed between Belgium and Holland, and the threatening aspect of affairs between France and the United States having been succeeded by one that promises uninterrupted peace, the most active and wealthy portion of the commercial world would seem to have less cause for uneasiness on this ground than for many years.

Apart therefore from any of the great political causes of disturbance to commercial operations, let us endeavour to ascertain the main sources of the present general commercial activity, and examine whether the comparatively high prices of the raw materials of manufactures be owing to accidental circumstances, which may cease to operate to the same effect, or which may, on the other hand, operate in the same direction with augmented influence.

We said last week, that we thought the general cause of the greatly increased commercial activity now prevalent, would "be found in the great and prolonged contraction of confidence at one period, and its great and long continued extension at another:"—that other bringing us up to the present time. And we proceeded to allude to the panic of 1825, as the commencement of the period of a great general contraction of confidence. It appears to us, however, that even for the deliberation of merchants in prospectively arranging their affairs, it would be safer to take a date about the conclusion of the war, or the year 1815, in order to obtain a clear view of the past and present state of mercantile confidence and the circulation of money. These are the main springs of the great commercial machinery under the operations of which communities are enjoying prosperity or suffering the pressure of severe distress; and to take a comprehensive and accurate view of their action, is a point of the first necessity. Proceeding with this inquiry we conclude that it may be assumed, without hazard of an objection, that the year 1815 may be taken as that point of time when mercantile credit was forced to a higher degree of excess and extravagance in all the commercial cities of Continental Europe lying north of the river Scheldt, than at any period during the antecedent fifty years. And not the slightest doubt can be entertained that still greater excess marked the credit transactions of the merchants of England. Including the commercial affairs of the East Indies and West Indies—each of more importance, in any question relating to trade, than many of the minor commercial countries of Europe—we believe the mercantile credit of Europe was in a state of greater extension at the close of the war than at any point of time in our history.

This being the condition of the commercial world at that period, we must recollect also that the paper currency (issued by, or under the sanction of the respective governments,) of all the states referred to, was in a corresponding condition of excess. With the exception of France, Spain, the Italian States and Turkey, we know of no country that would not come under this description, as far as paper currency, purporting to be payable on demand, is concerned. All circulation had indeed been obstructed in the United States of North America by the war carried on in her own provinces, but on the removal of that obstruction it became free and expanded immediately.

We repeat, therefore, that the commencement of the year 1815 may be taken as that point of time when the circulation of mercantile credit, and the paper money issued by Banks and Governments, was conjointly in a state of greater excess and extension than it ever had been at any previous date. Soon after that period every Foreign State included in the above description began to take steps for rectifying its paper currency but not in any material degree, by diminishing its amount. In 1816, the British Government entered upon that series of measures for raising the value of the currency that were finally terminated by the Act of 1826 for the suppression of small notes in England, and which was carried into complete operation in the year 1829.

With these important facts before us, the great matter of interest is, to ascertain what has been the nature of the proceedings, relating to their money affairs, of the different commercial countries, since the year 1815. We must content ourselves with taking a hasty glance at some of those most materially bearing upon the subject. France was in that condition most favourable for the extension of her circulating medium, and the expansion of mercantile confidence, because her currency was almost purely metallic, and the credit of her merchants and manufacturers was extremely limited. France has coined, since the termination of the war, eighty-five millions sterling, or about 2,100,000,000 francs, and as the only tangible proof that we are enabled now to give of her increased mercantile affairs, as it is shown in banking transactions, we may refer to the progressive extension and influence of the Bank of France. The business of that establishment in the year 1834 was more than double that of 1832, and though it may be true that in the year 1832 it continued to feel the influence of the troubles and agitations of the revolution of 1830, and its consequences, we believe that since 1834 the increase in its business has been progressive and considerable. The circulation of its notes is now, we understand, about ten millions sterling. The industry, trade, and commerce of France were never in a more satisfactory state than at this moment. This we attribute, in great measure, to the gradual, but sensible, increase of the circulating medium.

Notwithstanding the suppression of single dollar notes in some of the States, and the determination of the United States Bank to discourage their circulation by issuing none itself for a smaller sum than five dollars, the paper currency purporting to be payable on demand has increased amazingly throughout the American Republic during the last twenty years. The amount circulating in 1835, compared with that of 1815, was ninety-eight millions of dollars against forty-five millions of dollars, or nearly double. This is the secret which explains the extinction of their public debt, and it accounts for the extraordinary development of their vast internal sources of wealth now in progress. As an illustration of the latter, we may mention that the Erie Canal was commenced and completed, during this period, at a cost of 10,500,000 dollars. The entire length of this great work, with its branches, is nearly five hundred miles. The revenue, derived from the tolls taken upon it, was in the year 1833, 1,430,000 dollars, and this amount has, we believe, been progressively increased. They will soon have railways traversing the whole country from north to south, and from the Atlantic to the Pacific ocean. The history of the world furnishes nothing resembling the rapid development of the internal sources of wealth now going forward in the United States of America.

Of the northern states of Europe we have nothing

but general information. In Sweden the circulation is wholly of paper currency, issued under fixed regulations which do not admit of much change. No diminution in its amount has taken place since the year 1815, and we understand, but little, if any, increase. In Russia, the Government has at different times, called in some of the notes in circulation, on account of the great number of forgeries, but we are informed the amount issued is now considerably higher than it was in the year 1815. The Czar is, we understand, perfectly aware of the great importance of keeping up an ample supply of paper credit as a means of promoting industry, and improving the commercial resources of his vast empire, and these means he is every succeeding year rendering more effective for the benefit of his people. The paper is as much depreciated as it was in the year 1815, and it exchanges for silver in the same ratio, viz., about four paper roubles for one of silver; the amount, however, both of paper money and silver, in the country, is much greater than it was at that date. Besides the mere amount of the circulating medium being greatly increased since the year 1815, extraordinary facilities have been given for promoting a more general and advantageous distribution of it throughout the vast territory of Russia. The Government regulates the amount of the issues, but since 1815 other banks have been established, and the Imperial Commercial Bank of Russia, for deposits, discounts, and agency, has carried on a very extensive business, which has proved most advantageous for its proprietors and the public. This bank has branches at all the principal cities—even at places so remote from the capital as Odessa, on the southern, and Archangel, on the northern confines of the empire. Another bank, called the Loan Bank, promotes the application of capital for great undertakings, public and private. Such useful means and appliances as these have all been brought into action within the last twenty years, and their direct and powerful tendency is to promote industry, increase and multiply productions, and augment the wealth of the country, without raising up a powerful money interest with objects at variance with the productive classes.

All recent travellers describe the increased industry and the internal improvement of Russia to exceed those of any other new country, except the United States of North America. She is, like the United States, making great advances in manufactures as well as in mining and agricultural affairs. The Russian Authorities understand too well the causes of the increase of wealth and power to permit their paper circulation to diminish.

The wise and paternal government of Prussia has not only kept the amount of its circulating medium more abundant than it was in the year 1815, but it has, since that period, established, or encouraged and sanctioned, the establishment of a public company, which is to make advances on agricultural produce in times of low prices and stagnation, and in this manner to enable the producers to hold stock for more advantageous markets, and still continue their payments to the State and the proprietors of the land. The benefit which this company has afforded by fostering the increase of fine woolled sheep, for example, is indescribable. This is a comparatively new product in Germany; the first few sheep, the breed of which produces it, were imported from Spain about seventy years ago. We believe we much understate the increase in the produce of electoral wools which has taken place in Germany since 1815, when we say that it is fourfold greater than it was at that period.

We all know, and shall speedily be made to feel more sensibly than we have yet felt, the effect of the competition of the Prussian manufacturers.—*From the Banker's Circular.*

Our attention has been called to the WATERLOO CÆSAREAN COW CABBAGE, the subjoined description of which would have raised considerable doubts in our minds as to the veracity of the narrator, had we not convinced ourselves by ocular demonstration of the truth of one part of the statement, namely, that it will reach ten feet in height. With respect to the effect produced upon the texture and growth of sheep's wool we must confess our scepticism.

This singular and extraordinary species of Cabbage, almost unknown in England till introduced by the persevering efforts of Mr. FULLARD, three years since, grows from *nine to twelve* feet high, and from *fifteen to twenty* feet in circumference. FIVE of these stupendous Cabbages, now raised to the greatest perfection in *quality* as well as *size*, have been repeatedly found, by proper management, an ample allowance of food for *one hundred* sheep or *ten* cows per day; and the nutrition thence supplied by this delicious vegetable will (as experience has already abundantly demonstrated) speedily produce the most surprising improvement in the *growth and utility* of every description of Cattle.

As an evidence of the beneficial tendency of this Cabbage, Mr. F. has the great pleasure and satisfaction of saying that sheep fed upon it have been found to produce wool of the finest silken texture, TWENTY-FIVE INCHES LONG,—a circumstance which cannot fail immediately to claim the utmost attention and admiration; as such, the cultivator of these Cabbages will not only realize pecuniary profit beyond any previous experience, but the manufacturer will also obtain a superior material to any heretofore produced by the most profitable speculation, the general and extensive demand for which must exceed all present calculation. The commerce of the country, as well as the interest and pleasure of the community at large, will likewise be greatly, if not incalculably, enhanced by the cultivation and use of this improved vegetable production.

This WATERLOO CÆSAREAN COW CABBAGE has been pronounced by the Father of the Agriculturists, whom, from his well-known experience, we are all bound to believe, to be the greatest wonder that ever appeared in the vegetable kingdom. It was shewn to that very highly esteemed and truly respectable gentleman, T. W. COKE, Esq. Holkham Hall, Norfolk, in October last, when he immediately said,—“*Mr. Fullard, you told me, three years ago, Agriculturists were only half way advanced in improvement,—this Cabbage makes me say, I am bound to believe you. I do say it is the greatest wonder the earth ever produced.*” Mr. COKE subsequently introduced several *Dukes* and other *Noblemen*, to the number of nine, to view this great production, all of whom expressed their astonishment, and engaged a part of the Seed for use this year, (1836.)

These Cabbages, if designed for the Winter season, can, for convenience, as well as advantage to the grower, be then removed from the fields, and will serve to make handsome serpentine walks in gardens, or they will form a most excellent avenue for winter across a field; or by setting them singly, will make a ground, that has not a tree in it, a park for Winter, and may be given to the Stock in Spring.

A part of this seed has been engaged by HIS MAJESTY, and forwarded to *Norfolk Farm, near Windsor*, to be planted this Season; and the production is already likewise patronised by most of the ROYAL FAMILY:—the DUKE OF WELLINGTON, and a great number of GENTLEMEN have selected the SEED for cultivation this year.

## THE LANDED INTEREST.

We have lately seen a publication, entitled "the Claims of the Landed Interests to Legislative protection, &c. &c." written by Mr. Blacker, and published by Ridgway, in London, and Curry and Co. Dublin, with the importance of which we have been very much struck. The writer first shews that the Agricultural Interests are in reality the National Interests, and then proceeds to discuss all the most important topics with which the latter are connected. We cannot lay before our readers all the subjects discussed, but shall briefly allude to four, and if the volume contained no allusion to any thing further, the manner in which these four have been treated, ought alone to render the publication at the present juncture invaluable. We refer to the discussion upon the relative importance of manufactures, commerce, and agriculture, to the wealth and prosperity of the community—to the treatise on the banking and monetary system—the corn laws, and the remedies pointed out for correcting the present redundancy of grain with national advantage, by turning a great portion of Ireland to the production of other produce.

The first is, or ought to be, the ground work of all legislation, for every act of the legislature ought to have in view the public good, and unless the importance of these rival interests thereto be well understood, the legislature will be steering the vessel of the state without a compass; and that this has been the fact is pretty well proved by the contradictory enactments which our statute-book discloses, to reconcile which, with any fixed principle of action would be a task that few would be inclined to undertake, and which, in our opinion, none could perform. However desirable it may appear, and evidently is, to establish upon these principles, in what proportion the manufacturing, commercial and agricultural classes contribute to national wealth and prosperity, we know of no attempt whatever heretofore, to analyze or explain, in any way whatever, a question at once so intricate and so interesting. In this respect we feel bound to confess, that our author has succeeded in solving the problem more clearly and concisely, than we could almost have thought practicable. Public attention seems to have never been seriously directed to the subject, and there seems to have been a tacit kind of admission that the importance of any branch of manufacture entirely depended on the value of the article produced, and the population employed; but our author in his present work brings quite new elements into the calculation, and shows most satisfactorily that manufacturers may be classed under three distinct heads, the respective importance of each varying according as the raw material of the manufacture, and the subsistence of the manufacturer shall be derived from the produce of the national territory, viz.—In the first place, a nation will derive the most extensive addition to its wealth and prosperity, when the entire raw material of the manufacture and the entire subsistence of the manufacturer are the produce of its own soil, as is the case in the hardware manufactory of England at present; the raw material, the subsistence, the fuel and machinery, being all produced at home. Secondly, where a nation does not produce the whole of the subsistence or the whole of the raw material, the advantage of the manufacture is precisely in the proportion of the extent in which it does produce them; so that the same manufacture may be changed in its importance according to these circumstances; thus the linen trade of Ireland,

whilst the flax was grown at home, was a manufacture of first rate importance, but when the raw material is imported from abroad it falls from its high degree, and is no better than the cotton or silk manufacture, except to the extent in which the flax consumed is supplied by the produce of our own soil, which is still in part the case. Thirdly—when the national territory produces neither the raw material manufactured, nor supplies the subsistence required by the manufacturer, whatever may be the appearance of employment or the bustle of business created, the advantage to the state under the most favorable circumstances must be very limited, and in certain cases little or nothing at all; being confined to the mere profit of the capitalist and the accumulation of saving (if any) by the operative out of the wages he receives; but if the operative spends his earnings in the ale-house or gin shop, this accumulation never takes place, as he is in that case no richer at the end of the year than he was at the beginning, and therefore the community can never be enriched in his person. Thus, all that would remain under such circumstances would be the profit to the capitalist, which in good times, may amount to something, but in bad times amounts to nothing at all, and at any time only tends to increase the already great wealth of a few, but not to its general diffusion. The cotton and silk trade of England were some time back examples of the foregoing; for then the food of the manufacturer was in a great degree imported, and the raw silk and cotton wool were imported also, and the general habits of intemperance existing among the workmen is too well known to require any proof, so that nothing remained to add to the wealth of the community, save the profit to the capitalist whatever it might amount to. The advantage of commerce is next shewn to consist in the nature of the articles exchanged, and not as was formerly supposed, according to the system called the balance of trade. Where the articles exchanged support or promote industry, the trade is beneficial, but when a country parts with articles of permanent value, and receives in return wine or spirits, or any thing which perishes in the enjoyment, that country can no more add to its wealth thereby, than any individual could increase his fortune by doing the same thing. Our author next comes to the consideration of agriculture, and calls attention to the circumstance, that every thing produced by the national territory is a direct addition to the national property, without any outgo, or deduction whatever. Its advantage to the state is not a mere profit upon capital, as in the case of manufacture and commerce, but it is a direct creation of capital itself.

The agriculturist is able or ought to be able, to support himself and his family, and after paying the expenses of his farm to improve his own private circumstances, equally with any other class of his fellow subjects, but, besides all this, he likewise pays his rent, which is a bona fide addition to the capital of the community, and mainly supports the entire frame of society. It would far exceed the limits of a newspaper to follow our author in his interesting explanation of the manner in which the produce of the soil formed originally the foundation, and still forms the support of all the comforts, the luxuries, and the elegancies of life, and how manufactures and commerce derive their chief value, by affording the means of converting that produce into valuable articles capable of long surviving the ordinary duration of the food consumed in their production, as well as the strength of the workman, who had been

nourished thereby. It is sufficient for us to say—that the produce of the soil being thus identified with the National interests, which is in other words, that of all classes of the community, our author proceeds to consider those subjects in which all the said classes are most concerned, and begins with the Banking and monetary system, explaining the operation and effects of the Bank Restriction Act of 1797, the Currency Bill of 1819, and the late renewal of the Bank Charter, the working of all which is distinctly set forth, and particularly the inadequacy of the latter, to confer upon the Bank any absolute power of controlling the exchanges under any extraordinary financial operations, and the great injury likely to arise from attempting to exercise any such power, by contracting the circulating medium, even if such power were in existence, and concludes the article by proposing a remedy, which is certainly supported by most plausible and powerful reasoning, but which we feel, must be referred to practical men to decide upon, and as we cannot do justice to the arguments offered by any extract, which our space could admit of, we proceed to the subject of the corn laws, which follows next in succession:—In regard to this question, so much has been written, that we anticipated but little of novelty in the discussion. The fact, however, did not turn out as we had expected—for a most important and novel operation is not only made, but is also in our minds most satisfactorily proved—namely, that the price of grain has been reduced to a lower price by the operation of the Corn Laws, than if there never had been any restriction whatever on the importation, and at the same time, it is distinctly and fully admitted, that the price of grain has been from 60 to 80 per cent. cheaper on the Continent all the time. The paradox, strange as it may appear, seems to us to be satisfactorily proved, and if so, it is decisive of the question which has so long been agitated as to the propriety of their repeal, and which is strongly opposed by our author, though a fixed duty is recommended by him in place of the present graduated scale. The fourth and last particular we shall comment on, is the suggestion that all other agricultural produce suited to our soil and climate should receive legislative protection as well as grain, which being effectually given, great part of the land now devoted to the cultivation of wheat, &c., would be applied to produce flax, butter, tallow, hemp, tobacco, &c., and thus by lessening the Irish export of grain of all kinds would tend most materially to correct that redundancy in the British markets, of which the English and Scotch farmers so much complain. The articles of flax and butter are particularly discussed, and it seems pretty clearly made out, that full protection in those articles would turn to their production land fully equal to produce two millions of quarters of grain; our author in considering that this would reduce the exports of Ireland to this amount seems to overlook, that the protection supposed to be given would cause part of the supply to be grown in England and Scotland, but this does not however lessen the anticipated relief to the grain market, in which respect, it is a matter of indifference in which country the transfer of the land to the production of those articles is made—that such protection would prove effectual to the transfer he anticipates is proved by the fact that the late advance on flax, on account of the failure in the Continental crops, has actually had that effect throughout almost all the North of Ireland. Our author points out the sound policy of the protection he contends for, by reference to the admitted principle, that the produce of the soil forms the true source of the riches of the country, and shews the great national loss arising

from the importation to such an enormous value from other countries of what we could produce at home, and strengthens his argument by pointing out the great advantage the state has derived from the partial protection afforded in regard to butter, the tax on which he clearly shews to be levied off the profits of the Dutch producer, and not to be in any way paid by the English consumer. Besides the foregoing leading subjects, there are many others scarcely inferior in importance, which are concisely but most ably discussed, as the repeal of the malt tax, county rates, tithes, absenteeism, the regulations adopted for the issue of Government grants, in regard to all which valuable suggestions are thrown out, and the work concludes with a forcible appeal in favour of the right of the labouring poor to be provided with employment, and the means of supporting themselves and those depending on them by the allotment of the waste lands, and a strong statement against the propriety of any compulsory poor law provision, as being likely to create more misery than it would cure, and strongly condemning the conduct of the legislature in the encouragement given to the consumption of ardent spirits. We are happy to see that in many respects the suggestions of the poor law commissioners lately laid before Parliament correspond with those contained in the volume we have just been reviewing, or rather giving a statement of its contents. It is written in a clear and concise manner; so concise, that we cannot without injustice to its merits attempt to give extracts, for which indeed our columns would not afford space. It is not our practice to take upon ourselves the office of reviewers, but feeling the importance at the present crisis of calling attention to this publication, and seeing it almost entirely overlooked by our brother Editors, we have thought ourselves called upon to recommend its perusal to our readers, and, if possible, to induce them to contribute their best exertions to carry its suggestions into effect. We see our northern fellow countrymen are already making the most active exertions to procure from the Legislature that protection to the growth of flax, in which they are most interested, and we trust the gentlemen of the South will not be so supine and so insensible to their own interests and the interests of their tenants as to let slip this favourable opportunity of accomplishing what sound policy and true patriotism so plainly points out, and what the English agriculturists will for their own sakes assist them to obtain, viz., effectual protection in the articles of butter and tallow—one-fourth of the entire importation into England of the former being supplied by Holland, and the latter, we may say, entirely from Russia, a power which is hostile to our trade in every particular, and takes nothing from us she can possibly avoid. It surely must appear evident, that if Ireland should not be able to afford immediately the necessary supply for the English soap manufactories, that a preference should be given to the oils of the Mediterranean or the tallow of South America, whereby our exports to those countries would be encouraged, owing to a profitable return being provided, and our own shipping would be exclusively employed. But we have already devoted too much of our space, and conclude by strongly recommending the work to the patronage of the public.

VICTORIA WHEAT.—From a variety of reports the following facts are collected:—It comes from the province of Caraccas; it has been recommended by Humboldt for its great productiveness, and bringing grain to perfection in a singularly short period—grown in the environs of La Victoria, on ground about 1900

feet above the level of the ocean; the flour is particularly sweet and well tasted, and makes excellent bread—this was proved in Warwickshire. If sown in February it may be reaped in June; seventeen grains were sown near Colchester in the middle of March and reaped the middle of July, and produced two quarts; if sown in June, and the season be fine, it will yield a crop in October. Its great value appears to be, that should other wheat crops fail, this variety may be sown afterwards in April or May. It seems to be like a good soil. One grain produced sixteen ears at Kingsbridge, South Devon. Mr. Byers, F.L.S., and Honorary Secretary to the Swansea and Neath Horticultural Society, has requested us to call the attention of our readers to this wheat, and he has offered to supply a few experimentalists with 50 grains each, on applying to him for them, on this condition—that they send a report to him of its success, the time of sowing and reaping, the soil, situation, and produce. Mr. Byers sowed six grains in October; three are now strong plants, having borne our severe winter, the other three grains were destroyed by slugs.

### THE MARQUIS OF CHANDOS' MOTION ON AGRICULTURAL DISTRESS.

The motion of the Marquis of Chandos on the subject of Agricultural distress, which was postponed on Friday, the 22nd April, in consequence of the adjourned debate upon the Carlow affair, came on upon the Wednesday following. Notwithstanding the conviction in our own mind, and which had been confirmed by the opinions of some of the sincerest friends of the Agricultural interest, that the agitation of the question at the present moment was by no means judicious, still our expectations were very much heightened by the recollection of the declaration of the noble Marquis at a meeting of the Buckinghamshire Agricultural Association, that he had a plan in his pocket which he contemplated bringing forward at the meeting of Parliament, but which like a prudent general he deemed it wise to keep secret for the present. Considerable disappointment was expressed previous to the appointment of the Committee upon the state of Agriculture, that the noble Lord had not described his plan, and sundry jokes were cracked at his Lordship's expense, the secret scheme having, amongst other appellations acquired that of his Lordship's "pocket pistol." Having always found his Lordship's ordinance of heavy calibre, although his aim was not always well taken, we abstained from joining in animadversion upon his supposed failure in generalship, until we should have seen what position he might take amongst the agricultural champions in the Committee. At length, however, having seen his Lordship's "pocket pistol" discharged without producing the effect of a pop-gun, we can no longer refrain from some remark. Ever since the Peace, at which period the great decline in produce commenced, the *tenantry* of England have been misled by false hopes. The Corn Laws have operated as the greatest delusion. We do not mean to say that they have not afforded some protection, but we do most fearlessly assert that they have not protected them to the extent they were led to believe. Therefore it is that we con-

sider those persons not to be discreet friends of the farmer who excite hopes, of the realization of which there is no reasonable expectation. That high prices do not necessarily benefit the tenant is manifest from the refusal of several landlords to return the usual per centage at the last rent audit. The high price of all articles except Wheat, and the late advance in the value of that article is at once taken advantage of to *virtually* raise rents inasmuch as the withholding the usual allowance is tantamount to an advance of rent. Sir James Graham opposed the motion of the Marquis of Chandos, and has thereby brought down upon himself the vituperation of the *high rents* advocates; the term "*renegade*" being applied to him by the authority of the Central Agricultural Society in no measured degree. Sir James Graham may, however, be proud of such censure, his friendship for his tenantry may be ascertained, not by his speeches *only*, but by his *actions*. He was not so "*wicked*" as to maintain war rents when prices declined, he will not be "*so wicked*" as to raise them when a trifling advance in the value of produce takes place. Each day's experience tends more and more to convince those who pay attention to the subject that high prices cannot be maintained, and that high rents are advantageous only to the receiver. The effect of the repeal of Peel's Bill by the Joint Stock Banks may be tested sooner than some persons expect, and the consequences *may* turn out to be the converse of what they expect.

### BRITISH PRODUCE AND MANUFACTURES EXPORTED IN 1834.—Account of the declared value of the principal articles of British Produce and Manufacture exported in the year 1834:—

	£.	s.	d.
Brass and Copper Manufactures . . .	961,823	2	11
Iron and Steel, wrought and unwrought . . . . .	1,406,872	2	1
Hardwares and Cutlery . . . . .	1,485,233	1	1
Tin, wrought and unwrought . . . . .	370,382	11	5
Cotton Manufactures . . . . .	15,302,571	7	1
Cotton yarn . . . . .	5,211,014	17	8
Linen Manufactures . . . . .	2,443,344	18	7
Linen yarn . . . . .	136,312	11	9
Woollen Manufactures . . . . .	5,736,870	11	0
Woollen and Worsted yarn . . . . .	238,543	15	9
Wool (Sheep's) . . . . .	192,175	14	1
Silk Manufactures . . . . .	537,198	5	4
Salt . . . . .	152,126	14	10
Soap and Candles . . . . .	263,972	4	11
Sugar, Refined . . . . .	916,391	8	0
All other Articles . . . . .	6,194,358	1	6
	41,649,191	9	6
Whereof from Great Britain were..	41,286,594	5	6
from Ireland . . . . .	362,567	4	0

THE WISEST TREE!—“The *Mulberic* tree is accounted, of all other trees, the *wisest*, because he never blossometh till all cold weather be quite past: so that whensoever you see the *Mulberic* begin to spryng, you may be sure that *Winter is at an ende!* He is ripe with the first; and buddeth out so hastily, as, in one night, with a noise, he thrusteth out his leaves: he changeth his colour thrice—first white, then redde, and lastly black!”—*Heresbachius' Husbandrie*, A. D. 1578.

## THE TITHE BILL.

TO THE EDITOR OF THE HERLORD TIMES.

SIR,—I agree with you in opinion, that the amended Tithe Commutation Bill is in some respects better than the last, but I cannot avoid thinking that it is, in some respects, worse; and that some of the most objectionable parts still remain; and that a great number of the clauses cannot be acted upon without inflicting great and unnecessary injustice.

By the 17th clause the parochial proportion of rent to the tithe owner is to be regulated by the amount of the poor rate paid by each occupier. I, in common with many other landlords, possess cottages, which, with about half an acre of ground, are let to day-labourers at about fifty shillings per annum; and many of these are rated at three pounds per annum. In a parish where a considerable part of my estate lies, where there are a large number of small freeholders, and where the poor's rates are very heavy, the cottager will have to pay nine shillings per annum to the tithe owner, for the tithe of half an acre of ground, and not worth so much to a farmer, nor let at so much as twelve shillings per acre; that is, the cottager will have to pay the tithe owner annually one half more than the total annual value of his ground!

By the 34th clause the commissioners are to ascertain what has been the gross annual value of the tithes of each farm, during the last seven years, which they will necessarily be about as capable of doing, as they are of ascertaining by what kind of animals the planet Jupiter is inhabited; and the difference of the allowance to the cultivator of twenty-five and forty per cent. will be nothing more nor less than a tax upon the liberal and just clergyman, and a bounty upon the illiberal and unjust one.

The mode of taking the averages of the price of corn will prove highly unjust and injurious to the possessors and occupiers of the soil of Hereford, and in some other counties. Much of the wheat of Herefordshire is consumed in Birmingham and in Glamorganshire; and the farmer will generally have to pay by a corn rent according to the price of corn in those places, and consequently the expense of conveying it, which is very heavy, will be a tax upon the farmer, and a bounty to the tithe owner; and the numerous railways at present constructing will operate, upon this account, very injuriously upon the agricultural interests of those counties through which such rail roads will not pass.

The Hereford farmers, who rear large numbers of cattle, and whose farms for that purpose are of most value, are obliged to thrash out their corn to obtain straw for their cattle, and are therefore under the necessity of sending much of their corn to market during winter; and then that usually takes the lowest price; and upon this, as well as upon other grounds, the proposed corn rent will be found to operate very injuriously and unjustly upon the interests of the farmers and landowners of this county.

I could easily state many other objections to the proposed bill, which I feel perfectly confident will operate more injuriously upon the interest both of religion and agriculture than the existing tithe laws, bad as those are; and I cannot but think that in the preamble to his bill Lord John Russell ought to have said, "whereas the agriculturists are too rich, and the clergy of the Established church too much respected and beloved, and the Established Religion of the country in too flourishing a state," &c. Be it enacted, &c.

Under the existing tithe laws the tithe owner cannot claim anything for all the herbage consumed by the farmer's labouring horses, or oxen, nor for that consumed by his young stock, which is rearing to supply the place of such stock, when that is sold; and no claim whatever can be made on account of the animals slaughtered, however numerous, for the use of the farmer's family, servants, and labourers; and by changing his mode of culture, he can, often without any, and generally with very little loss, greatly reduce the value of the tithe; but by the proposed bill all these advantages will be taken from him; and if the clause

of the bill be made compulsory, as proposed, that will, I very confidently predict, be found to operate still more injuriously upon the interests of religion than upon agriculture.

I remain, Sir, your obedient Servant,  
T. A. KNIGHT.

The subjoined short extracts from the second report of the Committee of the House of Commons, on Agricultural distress, are deserving of notice. Mr. Bickerton, of Shropshire, examined by

Mr. Clive.] What should you say of a repeal of the duty on clover seed?—I think it would be beneficial to that part of Shropshire in which I reside.

Is cloverseed grown in your neighbourhood?—Sometimes it is, but it is more as a speculation than as any regular system; and when it is grown I think it seldom pays, it is so precarious in ripening.

Sir R. Price.] Do you consider it an exhausting crop?—As exhausting a crop as wheat, and a very uncertain crop; I have seen what appeared good crops of clover upon the land that would not yield twice the seed again; it was carried for fodder afterwards.

Mr. Scott, of Liverpool, states that there has been a decreased importation during the last three years, (pages 34 and 43.) In answer to a question by the Hon. Robt. Clive, this witness said that the supply into Liverpool is principally from Ireland, and what comes coastwise from Norfolk, Suffolk, and Scotland.

Mr. Wodehouse.] Do you not believe that, generally speaking, the persons who are in the habit of making returns of the prices of corn are those who are usually the purchasers of the best samples of corn? Yes, I think they are.

Mr. Denison.] If the averages were taken weekly, you think it would be in the power of persons to raise them for a particular purpose?—It might be done certainly.

It appears that there were one hundred thousand quarters of wheat in bond in Liverpool for the last three years, at a loss of 9d per bushel, or 5s 3d per quarter, per annum; and a waste also of from 3 to 5 per cent.

Mr. Howard, of Yorkshire, when speaking of the rot in sheep, says, that in 1831 entire flocks were destroyed; and that if the present prices of wheat are continued, fifty thousand acres of land in that county will go out of cultivation. He also states, that less Wheat has been sown, and more Barley, this year; therefore Wheat may rise in price and Barley fall. This gentleman was asked,—“Do you consider that the repeal of the Malt Tax would benefit the Farmer?”—Answer, The Malt Tax is paid by the Consumer—not by the Farmer.”

Mr. Sanders, a gentleman engaged in the Irish Corn Trade, states (p. 131.) that he thought Agriculture in England had now reached its lowest point of depression, and that there is now a prospect of improvement. He believed that a great deal of smuggled Malt came from Ireland. He was certain that if a varying rate of Duty on importation is altered to a fixed duty, it would ruin the English Farmers.

Sir J. Graham.] If the ports be constantly open at a fixed duty, are you of opinion that by the increased cultivation of wheat in countries having ports upon the Baltic, the foreigners could steadily supply this country at a price not much higher than they now do?—Probably it would be somewhat higher; I think you would have an average price of wheat in this country, with an 8s duty, somewhat about 36s.

Then that would displace the wheat of Ireland?—No doubt it would, and I can show that a duty of 8s a

quarter upon foreign corn would be entire ruin to the tillage agriculture of Ireland; for this simple reason, the wheats produced in Pomerania, and Silesia and Poland are more than 8s better than the Irish; consequently it would be no protection at all to the Irish, and the loss to the agricultural interest there would be very serious, and not only the loss to agriculture, but also a tremendous loss to the milling interest of Ireland, which is becoming one of the most important interests of that country.

Therefore, if Pomeranian wheat were in the market, and selling at 38s a quarter, Irish wheat could not sell for above 30s in your estimation?—Certainly not.

## ANIMAL PATHOLOGY.

By MR. YOUATT.

(From the *Veterinarian*.)

### MORBID STATES OF SENSATION.

The diseases of the nerves of sensation in animals to whom nature has denied the power of speech, and who only by signs, comparatively inexpressive, and frequently delusive, can enable us to guess at what they suffer, is a subject difficult to treat upon, and on which we can scarcely arrive at a satisfactory conclusion. I fear, too, that the natural difficulties of such a subject are much and disgracefully increased by the inattention of many of us to the indications of pleasure and of pain in our quadruped patients. In our treatment of disease, and in many of the operations which we perform, the value of the animal as the slave of man, and the degree in which we can make him, his services and his very form, subservient to the caprice of man,—these are our primary calculations; and the enjoyment or the suffering of the animal itself are subjects of mere secondary consideration; or, thus far only, taken into the account at all.

Well, gentlemen, we must take this subject in its turn, not deterred by its difficulties, and fully resolved that even where we have so few facts to reason upon, we will not admit one of them without sufficient evidence.

**LESIONS OF THE SENSITIVE NERVES.**—We have to consider the lesions or morbid conditions of the nerves that spring from the central columns of the superior (posterior) surface of the spinal cord, including those of common sensation, multiplied chiefly about the skin generally, and those more especially devoted to the sense of touch, and accumulated on certain parts only of the integument. When we considered the physiology of these nerves, an important distinction was drawn between those of common sensation and those of touch; the former being susceptible of certain impressions, pleasurable or painful, referrible to the general well-being of the animal, the others being intimately and necessarily connected with the mind. We cannot, however, maintain this distinction in a pathological point of view.

**DIVISIONS OF THESE LESIONS.**—These sensitive nerves are the media through which impressions relating to the organic, or the animal, or the intellectual life, are conveyed to the common sensorium; and we can only conceive of three modes, and applicable to them all, in which they depart from their healthy function, namely, when they are too acutely or not sufficiently sensible to impression, whether from external or internal causes, or when they convey impressions not simply too vivid or too obtuse, but otherwise wearing a delusive character. I need not remind you that, in this investigation, we have nothing to do with the nerves of pure sensation deriving their

origin from the base of the brain: they will afford matter for future consideration.

**THE SENSITIVE NERVES DISTRIBUTED TO EVERY PART.**—The nerves proceeding from the central columns of the superior surface of the spinal cord, are not only, according to their relative position, determined in an especial manner to certain parts connected with animal life, and to which they essentially belong,—perhaps I must not say that they *anastomose* with other nerves, for it is evidently necessary that the impression, pleasurable or painful, beneficial or injurious, should be referrible to the precise point on which it is made, and that no painful feeling should spread around, unless when some injury is extending, and needs instant remedy—I must not say that they anastomose with other nerves, but they ramify into innumerable branches of extreme minuteness, and spread themselves over every portion of both systems. They do so in order to be everywhere the organs of pleasure or of salutary warning; and they keep up a common feeling and a common sympathy, on which the well-being of the system and the proper action of every part depend.

**THEIR NATURAL STATE.**—Are they in a quiescent state when the animal is unconscious of any determinate pleasure or pain?—No, they can never be altogether quiescent; there is a feeling of health, not easily to be described, but having a real and delightful existence when the various parts of the frame are working harmoniously and well; and there is a real and wearisome sensation when disease is about to attack the frame. There are certain acts in which the excitement of a portion of the nervous system is attended by a great degree of pleasure; but, generally speaking, an undue excitement is accompanied by or degenerates into pain. Their healthy state borders far more upon quiescence than upon excitement.

**FIDGETINESS.**—There are certain states of the constitution in which there is a slight and yet unpleasant degree of exaltation of the sensitive nervous system—a kind of fidgetiness, than which there are few things more annoying. We see it in the stabled horse unexercised and over fed. He is not still an instant; he is pawing, weaving, cribbiting, nibbling, and biting himself in every part. If he is taken out of the stable, he knows not what to do with himself; and his rider scarcely knows what to do with him. He is most annoyingly and unmanageably fidgety. He is worse, if possible, than the young student who cannot keep himself still for a moment, but worries his neighbours, and distracts the lecturer to a degree of which he has little conception.

There is a species of dog, the favourite of the ladies, the detestation of every man, and the essence of whose character and constitution is fidgetiness or perpetual motion;—I mean the small French poodle. From the earliest to the latest hour he is in incessant action; distinguished by no peculiar intelligence, by no disinterested affection, by no peculiar submissiveness even to those by whom he is fed. He is an apt illustration of that undue accumulation of irritative nervous power which torments himself and all around him except his mistress; until it has found an outlet through which it may be expended.

**IRRITABILITY AT THE COMMENCEMENT OF DISEASE.**—There is another species of sensorial irritation which is more decidedly connected with disease; not merely a shifting of the posture, or the irregular movement of a particular limb, but a continual restlessness and wandering. The horse at the commencement of almost every febrile attack, is shifting his posture and his place every instant; lying down and getting up again, pacing around his box, and measuring it in every direction. The sheep under the influence of

the hydatid will wander to the farther part of the pasture; lie down, gaze mournfully around him, and then get up and wander again; some strange convulsive motion of one of the limbs interrupting or giving a singular character to his walk. The dog, when rabies is about to establish itself, is the most irritable restless being that can be conceived of, starting convulsively at the slightest sound, disposing his bed in every direction, seeking out one retreat after another in order to rest his wearied aching limbs, but quiet only for a moment in any one, and the motion of his limbs frequently simulating chorea, and even epilepsy.

**PAIN FROM OLD WOUNDS AND FRACTURES.**—There is another morbid sensibility of certain parts, very peculiar in its character. There has been lesion or bruise of the integument; and although the wound has healed, and the injured portion appears externally to have been perfectly restored, the nervous fibrils have not regained their healthy tone. Circumstances of the most trifling nature excite a degree of uneasiness that often degenerates into extreme pain. A change takes place in the weather; the weight and pressure of the atmosphere has considerably varied; it has materially diminished; and the balance between the pressure of the external air and the resistance or elasticity of that within the integument is disturbed. If the parts were in a healthy state they would scarcely be affected by, or would accommodate themselves to the change, but they retain, from this previous injury, a degree of morbid irritability, and considerable uneasiness or acute pain is felt in the part. The corn shoots, and the rheumatic joint aches, and the nerve of the carious tooth gives torture scarcely to be borne. There are few persons who have attained to a considerable age without being painfully conscious of many atmospheric changes. The foot, or the stump, is as true an indicator of the weather as the best barometer can be. Some pride themselves on this gift of prophecy with which they are beginning to be endowed; but it is a faculty dearly purchased at the expense of many a twinge and many a cramp.

**IN ANIMALS: THE HORSE.**—There is scarcely an animal that comes under our medical care in which nearly the same affection is not visible. A valuable horse has been ridden by day and by night, in fair weather and in foul, at moderate speed, and sometimes almost without compassion. He has been lame many a time, and I have traced the situation and nature of the lameness; he has been lame at other times, and there was not the slightest heat, engorgement or tenderness to point out to me either the one or the other. After awhile it disappears; but it returns again, perhaps after some severe exertion; possibly without any assignable cause; until, at length, I begin to trace a coincidence between a return of the lameness and cold and wet weather. I examine still more carefully, and I find that the lameness precedes the atmospheric change. I dare not go farther. Thus far, however, I have been able satisfactorily to go; and mentioning the circumstances to other practitioners, or observant horsemen, I find that their conclusions and mine do not materially disagree.

**THE DOG.**—The huntsman has better opportunity for observing these things. He has had the chest founder in his kennel, possibly owing to his own negligence, or the aspect of the building, or the soil on which it stands. He has observed these periodical lamenesses among his dogs; he has connected them with atmospheric change and atmospheric influence; and by degrees he has begun to observe that the change in the dog, at least, accompanies, and mostly

precedes the change in the weather; and he begins to regard the tucked-up appearance, or the disinclination to move, or the lameness, or the yelping of old Dido, as a seldom-failing prognostic of bad weather.

All this is referrible to certain parts of the frame once injured, and never perfectly reinstated; still retaining a considerable portion of morbid sensibility and affected by circumstances that would be powerless with regard to the perfectly healthy constitution or part.

**ATMOSPHERIC INFLUENCE CONTINUED.**—The quadruped or the feathered biped, however, is far more exposed to the influence of atmospheric changes than is the human being; for he has not the means of sheltering himself from the biting storm, and he is exposed to a greater variety of accidents, and therefore he will be likely oftener to have these morbidly sensible portions—these inlets of pain and disease. Nature has been doubly careful of these animals; she has denied them a degree of feeling which would be a curse to them rather than a blessing; and she has furnished them with an apparatus by means of which they may, for a longer time before these changes of weather, and without any of those annoying ailments which make the human being weatherwise, be warned of the approaching storm.

**THE NATURE OF ATMOSPHERIC INFLUENCE.**—The changes of the weather are dependent upon changes in the electricity of the atmosphere generally, or of some of the gases of which it is composed. An alteration of density, or temperature, or moisture, or drought, is the effect of this electric change. Were not the animals who were destined to live amidst these influences protected from their immediate and sudden effects, life, and all the comforts of life, would be endangered or soon destroyed. Were too much of the fluid portion of the frame rapidly absorbed by the surrounding drought, or the necessary exhalations from the surfaces suddenly arrested by the immediate contact of moisture; were the vital heat to be stolen away by the surrounding air more rapidly than it could be generated; were that species of electricity, call it by what name you will, on which the vital power depends, to accumulate rapidly and without bounds, and cause the flame of life to be quickly exhausted by excitation; and were that which exerts at once its negative and depressing power, to rush upon him without warning, existence would often be at hazard, and ere long extinguished. Nature has therefore given to these animals a protection against these influences. She has covered them, more or less thickly, according to their wants, with hair, or wool, or feathers, bad conductors of heat, of electricity, and of moisture, and resisting for a certain, and often a considerable time, their painful or injurious effects. She has done more; she has placed a sentinel that never fails to tell of the distant approach of the most dangerous of these foes. The hair, the wool, and the feathers, are formed of highly elastic substances, and all terminate in points. The slightest impression made on the extremities of them is rapidly conveyed to the root; and that root is imbedded in a tissue of nervous matter; so that from the slightest change of external influence a feeling is communicated, allied to, yet different from, common sensation, and which can never be overlooked or mistaken. We go into a room in which an electrical machine is worked. There is no indication from the skin, or from the more delicate sense of touch, to indicate the change which is taking place in the electricity of the atmosphere of that room, and we should approach near enough to receive the spark or the shock, without being aware of our danger, were it not for the

hair, which begins to move and to stand on end, and to tell us what is going forward.

INDICATIONS OF ATMOSPHERIC CHANGES BY ANIMALS.—The commencement of the electric change long precedes its palpable and manifest effects; and thus the animal is placed upon his guard, and seeks for shelter, or lays in a provision of food to last him during his retreat, before the rain and the storm come on. A connexion between certain actions of the domesticated animals, and certain atmospheric changes, has been observed and registered from time immemorial. I do not know the quadruped slave that does not occasionally give us warning of them. Have you never observed the restlessness, and uneasiness, and the occasional starting of the horse you are riding—or the crowding of the horses that are at grass to that part of the field where the pasture is most luxuriant, and most easily and quickly got at? Have you never attended to the intimation which was given by the frequent and impatient braying of the ass, and the continual shaking of his ears?

'Tis time to cock your hay and corn  
When the old donkey blows his horn.\*

When cattle begin to chase each other around the pasture, either voluntarily, or in consequence of the persecution of the fly, or bellow as they run,—when they assemble together in a corner or part of the field, and with their tails against the wind,—or when they stand with extended nostrils, and with the head up snuffing the air, the farmer suspects that rain is not far distant.†

When the swine run squeaking about, throwing up their heads with a peculiar jerk, and carrying pieces of straw in their mouths, it is said that windy weather is near at hand. The country people say that “the pigs certainly see the wind.”

The sheep either crowd to the best part of the pasture, or indulge in unusual gambols and vagaries. I once resided near Kingston, and had lodgings opposite to Hampton Court Park: and I need not no more certain barometer than the deer. As soon as I got out of bed, I used to observe in what part of the park they were. If I could see many of them, and towards the Duke of Gloucester's Lodge, it would be a rainy day; and it would be useless for me to get my fishing tackle in order. If there were a few of them straying about in that direction, it would be one of those cloudy and partially showery days when I was sure to get sport. If I could not see one of them, I might be guided by other circumstances as to my expedition; but one thing was certain, that not a drop of rain would fall on that day.

INDICATIONS CONTINUED.—I will not much longer detain you about this. “When the ducks quack loud, the peacocks cry”—when the cock crows at unusual hours, and crows a great deal in the daytime, and particularly in Summer—when the poultry are more than usually busy in oiling their feathers—when the water-fowl more frequently wash themselves, and flutter about in the water, or take wing, and dash along with unusual clamour—when the swallows fly low, and the missel thrush sings most loudly and yet most beautifully—when the pigeons return slowly and unwillingly to the dove houses,

long before the close of day—when the familiarized and half-tamed redbreast pecks most impatiently against our windows—when the rooks return home early, or if they remain in the fields are joined, in greater quantities than usual, by the jack-daw and the starling, or when they whirl furiously round, and dart rapidly down from an immense height in the air (“they seem precipitate to fall, as if they felt the piercing ball”); rain is at no great distance, and storms will accompany the rain. All these circumstances, gentlemen, do not indicate any morbid state of sensation, but a peculiarity of it, wisely and kindly given to them as a warning of approaching inconvenience or danger. Some of you, who have not quite forgotten your classical learning, will probably recollect how beautifully Virgil describes these things in his first *Georgic*.\*

THE PAIN OF AN INFLAMED PART.—The sensibility of the nerves may be increased by certain changes of their condition or that of the parts on which they are distributed. Pain is the constant attendant on inflammation. This has been explained in various ways. The essence of inflammation, or the immediate consequence of it, has been said to be increased determination of blood, turgescence of the capillary vessels, increased interstitial deposit, and consequent compression of the neighbouring parts, and pain as the necessary result of that compression. It is, however, enough to say, that the sensibility or the function or action of every part is in proportion to the quantity of arterial blood—the *primum mobile* with which they are supplied. Those parts which, in their natural state, are the most sensitive are those which are most abundantly furnished with blood-vessels, as well as with nerves; and the increased sensibility in inflammation depends on the increased determination to the part producing a morbid discharge of the natural functions.

ILLUSTRATIONS.—Is any laboured proof required that inflammation is attended by acute pain in the quadruped as well as in the biped? Take that singular disease in the horse, inflammation of the subcutaneous tissue of the hind leg, attended by enlargement, sudden, painful, and enormous. The horse is well to day, and to morrow he is gorged from the fetlock to the sacrum. The whole of the integument is tense, red—red even in this animal, whose skin is thick and covered with hair; it is of a glossy red, and an ichorous discharge is forcing itself through every pore of the distended integument. The very appearance bespeaks the torture which the animal endures; and if the finger is laid on the part tight as a feather, the leg is spasmodically caught up, the animal is thrown quite off his feet, and often falls upon and injures the incautious examiner.

Observe the quickened pulse, the haggard countenance of the horse, labouring under acute founder, the continual shifting while he stands, the resting of the muzzle on the diseased part when he is down, and the groans that are at almost every moment extorted from him, and no doubt can remain with regard to the torture which he undergoes.

\* *Haud equidem credo quia sit divinitus illis  
Ingenium, aut rerum fato prudentia major;  
Verum, ubi tempestas et cœli mobilis humor  
Mutavere vias, et Jupiter humidus Austris  
Densat, erant quæ rara modo, et quæ densa relaxat:  
Vertuntur species animorum, et pectora motus  
Nunc alios, alios, dum nubila ventus agebat,  
Concipiunt; hinc ille avium concentus in agris  
Et lætæ pecudes et ovantes gutture corvi.*

\* “I once noticed,” says Mr. Forster, “that a donkey confined in a yard near the house on a showery day brayed before every shower, and usually some minutes before the rain began to fall.”

Suspiciens, patulus captavit naribus auras.

VIRG. *Georg. I.*

VIRG. *Georg. I.*

**NEURALGIA.**—A painful affection of some particular organ or spot, or the body or ramification of some nerve, is a disease fortunately not of frequent occurrence in the human being. It can easily be imagined that inflammation of a sensitive nerve—the determination of an unnatural quantity of arterial blood to it or its neurilema—would be the cause of exquisite pain; and on examination after death, mechanical injury of the nerve, or inflammation of its substance or neurilema, or of the cellular substance surrounding, with spots of ecchymosis and general thickening of the parts, have occasionally been discovered. In other cases, however, and perhaps the greater number, dissection has cast no light either on the precise seat or the cause of the affection. Scarcely in any case during life is there sufficient acceleration of the pulse, or tenderness on pressure, or heat or coldness of any part, to account for a thousandth portion of the torture which the patient endures.

**NEURALGIA IN THE QUADRUPED.**—Then what shall we be justified in affirming of its existence and character in a dumb animal; or how shall we so accurately detect its precise situation as to apply the only radical cure—generally speaking, at least—the division of the nerve? How shall we ascertain the real nature and character of a complaint which demands an essentially different kind of treatment in different cases? How shall we determine whether it be inflammation of the nerve or its neurilema, or irritability of the one, or both?—essentially different states, and demanding, in a variety of instances, the application of almost opposite remedial measures. Here we acknowledge and deeply feel our inferiority.

**RHEUMATIC NEURALGIA.**—The existence and the treatment of this disease, in one of its associations, we are, perhaps, justified in predicating with regard to the horse. It may afford us a clue to the cause of those flying lamenesses to which I have alluded, and that are frequent in old and rheumatic horses, and younger ones whose powers have been too severely taxed. The lameness is excessive, and the pain is evidently excruciating. The animal dares not to rest the slightest portion of his weight on the limb, or even to touch the ground with his toe. He is heaving at the flanks, sweating profusely, his countenance plainly indicative of the agony he feels; but we can detect no heat, or swelling, or tenderness. It is a pure nervous affection.

**FLYING LAMENESS.**—What do we do? We abstract a little blood—we give a dose of physic—we foment the whole of the limb—we put some additional clothing on the animal; and the next morning we often find him well, or we find that leg well and another leg similarly affected. Is this neuralgia or rheumatism? or a compound of both? These are questions which we cannot answer; for our patient cannot point out to us the precise situation of the pain, as being in the course of a nerve, or spread over the fibrous membrane of a joint.

**FRENCH OPINIONS OF IT.**—In the French school neuralgia is decidedly admitted as a malady to which the horse is occasionally subject; but it is said to be accompanied by that peculiar twitching whence it derives one of its names—the *tic douloureux*, or painful muscular spasm; at least it is affirmed, that this is the only symptom by which it can be recognized.

Hurtrel d'Arboval, professing to quote from the records of the veterinary school at Lyons, speaks of a horse that had a convulsive agitation of the head up and down, and other unusual but momentary muscular spasms, and evidently suffering a great deal of pain, but in every other respect being apparently well. A long course of anti-spasmodic treatment

had no effect upon him; but he was cured by being put to severe post work. This account is very unsatisfactory, and the case appears to be one of chorea instead of neuralgia. I have in vain searched the records of this school for the original description of the case.

Vatel gives the most unobjectionable account of it. He says that "the absence of heat of the skin, and frequency of the pulse, contrasted with the evident intensity of the pain and the disordered function of the part, form the surest diagnosis. Inflammation sometimes succeeds, especially when the attack is of long duration; then the lesions observed on dissection are of an inflammatory character."

**PRURITUS.**—That the domestic animals are subject to intense and intolerable pruritus, we have almost daily proof. The sufferings of a dog with acute red mange, and the lacerations which he sometimes inflicts upon himself, are dreadful. I have seen him wrought up to that pitch of insanity, that he has torn great pieces of integument, and even of muscular substance, out of his flanks and the inside of his thighs. It was scarcely a week ago that a mare in our infirmary with a papular eruption on her haunches, broke her halter in the night, and blemished herself for life by tearing away mouthfuls of hair and of integument too. A lotion of diluted hydrocyanic acid afforded her almost immediate relief. Sheep affected with the scab appear to be dreadfully tortured by intense itching. The wool is torn away in mouthfuls—the skin is lacerated in numerous places—the animal is in incessant motion, and pines away and dies in a less time than would scarcely be thought possible.

I do not know any case in which an excess of sensibility spread over the whole of the skin, not as a consequence of cutaneous disease, but an evident affection of the sensitive nerves; a very singular one of hemi-hyperæsthesia, however, if I may so call it, did come under my notice. A horse was bitten in the left hind leg by a mad dog, and in process of time he became rabid. The owner would not have him destroyed, and he was slung, in order to prevent mischief to himself or others. When I approached that side the poor animal was agitated, and trembled, and struggled as well as he could; and if I touched him only with my finger, a profuse perspiration broke out, and the pulsations were quickened more than ten beats in a minute. If I went round to the right side, he permitted me to pat him, and pressed his head against me, and sought my notice. There are several cases recorded of the human being, in which the sensibility was morbidly increased on one side, while on the other side there was the natural degree of feeling, and in some cases much less than the natural degree, and even none at all. Two sets of perfectly opposite symptoms, produced by the same cause, existed at the same time, and the barrier between them was the median line of the spinal cord.

**CONCLUSION.**—Well, gentlemen, I terminate this obscure and comparatively profitless subject. We have no data, and we must not reason without them. The only conclusion, perhaps, at which we can arrive is, that in the common and healthy state a certain degree of nervous sensibility is, for wise and benevolent purposes, withheld from the brute; but that the diseases of the nervous system present much similarity, or almost identity, and that under disease a great degree of suffering, perhaps not an equal one, awaits both.

Of the treatment of these neuroses I have said but little, because I know but little of their nature and their indications of cure. Perhaps, if our knowledge of them approached to that of the human teacher, I

should still be cautious what I said; for, while not a single veterinary surgeon treats on these complaints, I find, when I have recourse to medical authorities, that the physician most uniformly and most strenuously recommends constitutional treatment, and with the surgeon there is nothing like the knife; and with both of them I should begin to fancy that "there is nothing like leather," did I not recollect an honest and downright difference of opinion between two splendid surgical luminaries—still, however, teaching me a lesson of caution:—"The principal relief has hitherto been derived from operations," says Sir Astley Cooper: "The division of the nerves does no good," says John Abernethy.

### DISTRESS FOR MILK TITHE.

BY THE DEAN AND CHAPTER OF RIPON.

On Thursday the 7th April, Charles Oxley, Esq, and the Rev. J. Newsam, Justices of the Peace, for the liberty and borough of Ripon, granted a warrant of distress for tithe on milk due as was alleged, to the Dean and Chapter of the Collegiate Church, of Ripon. On *Sunday* evening, the 10th instant, the whole of the constables of the town received notice to attend at the Court House on the following day; and in attending, in pursuance of this notice, they received instructions to proceed to the cottage of William Darnborough, to assist in executing a distress warrant for tithe, and accompanied by the town serjeant and a bailiff, to whom the warrant was given, they proceeded to his cottage and seized and carried away in a cart provided for the purpose, one chest of drawers, six chairs, six hams, and two sides of bacon, which they conveyed to the House of Correction, as a place of safe custody—amidst the execrations of the numerous assemblage, which this extraordinary procedure had called. It will perhaps be in the recollection of our readers that on two former occasions, this same individual had his goods seized, and sold by public auction, for the payment of tithe, but on both occasions they only fetched about 2s 9d, no individuals being found wishful to purchase them; in consequence the expenses fell on the dean, without obtaining his claim. However, upon the third seizure, it became imperative they should be sold for their utmost value, accordingly they were removed (as before stated) to the House of Correction, and there impounded for nearly a week, when they were announced for sale on Saturday, the 16th instant, at 10 o'clock, in a croft behind the said prison; the whole of the constables again receiving notice to attend; a great portion of the inhabitants were also attracted to the sale, as it was generally understood that hirelings (or emissaries) had been engaged to scorne the full value of the articles, and in this they were not disappointed; but can it be believed that individuals, moving in the highest rank in society, could be found stooping to such dirty work, as to oppose a poor cottager, the father of ten children, in the purchase of his goods, which had been seized for tithe, and which he refused to pay, from conscientious motives. But the sequel will show that such, alas, was the case. The first articles offered for sale, were the six hams, when poor Darnborough bid one penny per stone, when a worthy Doctor (a lover of swine's flesh) immediately bid 5s—and a *gallant General*, 6s—ultimately they were knocked down to Darnborough for 8s 6d per stone, as was the sides of bacon and chest of drawers, they likewise fetching their utmost value. Darnborough, however, not wishing the worthy Doctor

to go empty away, suffered him to become the purchaser of the chairs for 10s, stating as his reason, that being aware his goods were about to be seized, he had these said chairs removed from a stable, the day preceding, they being infested with a noisome insect, and consequently thought it a favourable opportunity to get rid of them, he therefore wished the Doctor joy of his *lively bargain*. Thus concluded a sale, which, for attraction, has seldom had its equal, but exhibitions of this kind tend more than a thousand arguments, to show the baneful effects of the present system of supporting the church. The whole amount of the sale was 5l 6s 1½.

The annexed is a statement of the account against Darnborough after the sale.

The following document is in course of signature, and it is hoped that all who wish to see the practice of tithing their milk abolished, will avail themselves of this opportunity of recording their opinions; remembering the adage, "Who will be free, themselves must strike the blow."

We, the undersigned inhabitants of Ripon and its environs, have viewed with feelings closely bordering upon indignation, the proceedings adopted, at the instance of the very Reverend the Dean of Ripon, towards a poor, but industrious individual, named William Darnborough.

We cannot but believe, that proceedings such as these have a strong tendency to degrade the established clergy in the eyes of the people; to compromise the dignity of the established church; and above all, to impede the advancement of Christianity itself.

Nor can we cease to maintain, that the practice of compulsory collection of tithe is entirely at variance with the precepts of Him, who, when he sent his ministers on their mission, commanded them to provide neither gold, nor silver, nor brass in their purses, but rely upon the voluntary contributions of their flocks.

We, therefore, subscribe the sums placed against our respective names, as much to evince our sympathy towards an object of clerical persecution, as to express our abhorrence of the attempt to enforce the collection of a species of tithe, which is now so odious, in the eyes of the clergy themselves, that in many parts of England it is not demanded at all.

A new and important invention, called the "Catecharian Beam," has lately been perfected by Messrs. Richard Witty and Co. It is a simple and effective mode of giving strength and solidity to floors of warehouses and manufactories, and appears equally applicable in the construction of bridges and viaducts. The plan has received the approbation of many scientific and practical men, and by some of the latter, we understand, it has already been adopted.—*Birmingham Gazette*.

ON THE DANGER OF OVER-DRAINING MOSS.

(From the Quarterly Journal of Agriculture.)

In No. 31, of this Journal, published December 1835, was inserted under the head of Miscellaneous Notices, page 482, a very interesting communication on moss improvements by Mr. A. Blackadder. In that instructive essay there is an assertion, a very important one, in which I do not accord; and coming, as it does, from a gentleman versed in such matters, it is calculated to mislead practitioners, if not contradicted. I therefore hope I may be excused in attempting a comment on the subject.

The assertion to which I allude is expressed in page 484, line twenty-six. I quote the line, as the print is close, and the sentence short, and might escape notice: "There is no danger of over-drying moss by draining." I admit that saying is correct in a general sense; but practice has furnished many exceptions to that general rule, some of which have come under my own observation. I select two of those, much in point, and will give them in detail.

On my riding over a gentleman's estate in Staffordshire many years ago, my attention was particularly directed to a moss which had been drained several years previously. It was then in a very unprofitable state, and was still deteriorating, principally owing to its having been over-drained. The moss was situate in a basin or valley surrounded by hills, the soil of which was sandy gravel, and the soil on which the peat was recumbent was of similar texture. In the draining operation a wide and deep ditch had been cut quite round the outside of the moss, at a great and unnecessary expense. That excavation, for so it might be termed, had effectually cut off the springs issuing from the bottom of the hills, and a considerable body of water was collected and flowing current at the bottom of the immense ditch. A large centre-drain, with tributary cross-drains, had also been cut through the moss. Those produced but little water at the time I viewed them, the former supply having been cut off by the exterior drain.

The sand and gravel thrown out of the drain had been spread over the moss, and the greater part was under arable culture. I was told it had also been well cultivated, limed, and dunged; but I must say, I never saw land of any description producing more miserable-looking crops of oats, barley, buckwheat, turnips, and potatoes. The only vegetable-looking promising was a small patch of rape. On one part the old turf had been pared and burned after the draining, but even there the crops were alike deficient. All the ploughed land was light and puffy, and the horses' feet sank deep into it. The mossy substance was fast decomposing and evaporating, and I was told the surface had then sunk four feet in level from the time of its being drained. I had no reason to misdoubt that statement, indeed it was evident that, in a very few more years, a small residue only of the moss would remain, and the sandy soil at the bottom be left without cover; that is, supposing the arable culture to be continued, and even if attempted to be laid down to pasture, grass seeds were not likely to take upon such loose puffy ground. As to the part not ploughed, it was in a little, and but a little, better state. It had also sunk greatly in level, and sand and gravel from the ditches had been spread over it. The herbage it produced was thin, stunted, and poor, principally

brown bents and Yorkshire soft grass, and these the stock did not eat. I observed, that had the lime and dung which had been thrown away upon the arable moss been applied to the pasture, and proper grass seeds sown, it would have tended to a better purpose; but even then a good pasture could not have been obtained upon that over-drained moss. The great expense incurred by the owner was thus misapplied; in fact, the occupiers told me the moss was far more valuable to them before the draining was commenced. I never saw a more complete failure in any similar undertaking.

I also viewed another moss upon the same estate, and only a short distance from the former,—it had been managed in a more rational manner. It was only partially drained by means of ditches cut across it, but not to the bottom of the peat; gravel and lime had been spread over the surface, and the turf had not been broken by ploughing; it produced pretty good herbage close eaten by stock: I observed white clover, florin, and many good meadow grasses. That land was rented at 20s per acre. The turf was thick and tough, and, in riding over it, the horses' feet left no impression, though it sounded hollow. It was dry weather at the time of my visit; the land would probably be poachy in winter, but the price at which it was let—and the tenants did not complain—was the true test of its value. I had no reason to believe there was much difference in the relative value of those two pieces of moss land, acre for acre, previous to draining; but certainly, when I saw them, the partially drained was better worth 20s the acre, than the thorough drained at a nominal rent.

Hence, judging on the two cases I have here stated, and of others similar in result which have come under my observation, I think I am fully justified in drawing a conclusion, that there is danger in over-drying moss by draining, especially where the soil on which the moss is incumbent is of an inferior description. F. B.

PRICE OF OXEN IN 1674.

Sir Roger Moyston had a great intimacy with Pyers Pennant. The following is the copy of a letter from the former to the latter:—

"Dear Pyers, Moyston, March 14, 1674.  
"I hope you will excuse me for the 4l you owe me for the pair of oxen, for I want the money to make up 20l to send my son to Oxford next week.

"I am, dear Pyers, &c.  
"Roger Moyston."

It appears, then, that 4l was the price of a pair of oxen in 1674, and that the Baronet of Moyston sent his heir apparent to the University with 20l in his pocket.

FORMER CONTRACT PRICES FOR HORSES AT THE WAR OFFICE.

In 1766-67, 21l. 1768 to 1792, 23l 2s. 1793 to 1802, 26l 5s. From 1803 to 1810 an allowance of 2s 6d per horse was made for every eighteen miles travelled, except the first eighteen, from the place of purchase to the head quarters of the regiment. This was raised to 3s in 1811.

## AGRICULTURE.—THE TITHE QUESTION.

We have taken the following extract from a pamphlet, entitled a "Third Letter to John Disney, Esq. on Reform in the Church and Commutation of Tithes," by James Trussell, farmer, of Woodham Ferns. This is not the first time that Mr. Trussell has appeared before the public as an author, with credit to himself and advantage to the community. To those who are warmly interested in the advancement of agriculture and the agriculturists, it is highly gratifying to see a "farmer" the author of any publication, and doubly so to see him proud of putting the stamp of his occupation on his title-page. We trust this literary improvement will progress amongst farmers as among other classes, and that Mr. Trussell's example will be followed by others. It is, however, not upon this ground alone that the little pamphlet now under notice is of value. It contains much valuable information upon subjects which do now, and must still further engross the attention of our legislators. We strongly recommend its perusal.

"I shall now proceed to state how this all-important question can be settled with justice to all parties connected with it; and when once passed into a law, it may remain so for a thousand years, ay, for ever, or as long as England shall remain in a state of civil society. I recommend, first, that an Act of Parliament be passed to alter and amend the laws relating to tithes, to come into force from and after Michaelmas-day, 1838. I should have said, it is not my intention to go into the full detail of this measure, as it would swell this pamphlet much beyond its intended limits, but shall compress my statements to as small a space as I can. The landowners and the occupiers of the country have been struggling with an unparalleled distress ever since the war ceased in 1815, which has reduced thousands of owners and occupiers to poverty. Of the various burthens they have had to contend with, the tithe has been one of the most serious, and has always been a great hindrance in the improvement of the soil, as well as the employment of the labourer. The maintenance of the labourer, when he has become chargeable to the parish, has fallen more heavily upon the tillers of the soil, as four to one, than upon any other portion of the community; again, the Malt tax has increased this charge; thus showing that the soil of this country is taxed to an enormous extent; and if there is a chance of relieving it of some portion of this oppressive taxation, without inflicting an injustice on any party, I say let it be done. If observations like these will not arouse and create an interest with those who are so materially concerned in them, I cannot tell what can be advanced that will; perhaps from their indifference and inattention, they may be saddled with a law that will inflict a lasting evil upon them and their posterity.

"I beg to observe, further, if the present proposed bill of my Lord John Russell is passed and carried into effect, it will inflict the greatest piece of injustice, first upon the owners, by a depreciation of the value of their soil to let, it being subject to a certain and serious charge, not taking into account its natural disadvantages, but its

state of cultivation only; secondly, it will affect all those who are under existing engagements the remainder of their term, and thus increase instead of lessen their present charge for tithes.

"Again, I conceive it quite a fallacy to go back for a term of seven years to draw a medium by; we want no such thing, for a far better plan is at hand. I would appoint a board of not less than five of our gentlemen in the commission of the peace in each county; they should have a register office in every county town, where they should meet from time to time to hear all appeals, if any should occur, between the opinion of the owners, the occupiers and the valuers. I would then have the dimensions of every parish, and the names of the patron and incumbent registered, with the names of the owners and occupiers of the different estates, and the amount of the present assessment, which would serve as a guide or reference when required. Secondly, I would appoint three of the most practical men in the county, from different districts, who should be thoroughly acquainted with all the different culture and process of occupations in the same, and who should go over, not only every farm, merely crossing it, but should go into every field, and take into account the different advantages and disadvantages of the same which would enable them to come to a much more just conclusion. If this ever should take place, let it be done properly, as it will then be likely to settle at once all the different opinions that may arise upon it. These gentlemen, the surveyors, should not be paid at the extravagant rate of five but at three guineas per diem, which would amply remunerate them for their time and services, and include all charges. When they came to their own property and occupations, the owner should step on one side, and the two, with the assistance of the nearest surveyor in the adjoining county, should assess the property. By thus conducting the valuation, it would at once do away with all jealousy as to the managing this important business, and put an end to all disputes in future. A fair and just assessment would thus be arrived at, and nearer the value nine times out of ten than could be determined by any of the valuers of the metropolis, who cannot, for want of practical information, be able to form so just an opinion as those whose time and lives have been spent in the occupation of the soil. I would have the valuation so made as to relate to the value of the land to let only, taking into account its natural state, and its capability of producing a given quantity of wheat or other grain, which is the grain that almost all our valuations are made by, and our rents drawn from. Perhaps it may be advisable to take in barley and oats in the more northern counties, where wheat is not the staple article of the soil; I would have no reference as to the present amount of rents charged, as that would inflict a great piece of injustice upon the occupiers, for there are thousands of instances where the rent is too high by one-third, according to the present prices. There is land in this parish that is charged from ten to twelve shillings per acre more than it is worth. If the value of the tithe is to be drawn either from the present state of the culture of the soil, or by the present rents, it would inflict great injustice upon the occupier, and at the end of the term the owner would have the good luck to be saddled with a new tithe charge in perpetuity. The proposed bill will at the end of all the existing engagements with the occupiers affect the owners of the soil, and they will find, when too late, they

have been saddled with a rent-charge upon their estates for ever, and their land must be let subject to their paying the tithe, as it will not be any part or bargain with the tenant; he, being made acquainted with the amount of charge for the tithe, hires it accordingly. To make it more plainly understood, I will suppose two farms equally situated, and of a quality that will yield for rent with good cultivation, three bushels per acre, with wheat at 5s per bushel, gazetted price, amounting to 15s per acre for rent—new system of charge for tithe 6s per acre; the landlord stipulating with the tenant to pay the same, he hires accordingly—namely, by giving 12s per acre instead of 15s per acre, thus leaving the landlord to pay the difference of 3s per acre out of his own pocket. If we show it in figures it stands thus—

Rent at 3 bushels per acre, and 5s per bushel .....	15s	} £. s. d.
New system of tithe, exclusive of deduction .....	6s	
The two sums above, amounting to 3s per acre more than the occupier can afford to give, which makes the account as under—		
Rent 3 bushels per acre, at 5s per bushel .....	15s	} £. s. d.
One-fifth part of the proved value of land, at 15s per acre, is the full value of the tithe, including all costs and charges in collecting, getting to market, &c. ....	3s	

the two sums amounting to 18s per acre, and which sum is all the land can be made to bear, for if any further sum is charged upon it, the cultivator cannot bear up against his expenses, as shown in my first pamphlet, pages 9 and 10. The cultivators of the soil cannot continue to occupy without an abatement of their indirect taxes, and the landowner cannot be expected to bear the whole. The tithe owner must always bear in mind that the occupier has to pay a heavy charge in the shape of indirect taxation, in raising the amount of composition which is paid in lieu of tithe, in labour, first in cultivating, and, secondly, in gathering, housing, and getting them to market. It has been plainly shown that Lord John Russell's proposed alteration would inflict a lasting injustice upon the owner of the soil, and a further additional charge upon the tenantry, so long as their present engagements are in existence.

But, Sir, to return to the object of this letter, I would have the Act framed to instruct the valutors to assess the value of all lands to occupy at the rate of 10 pounds per load, taking into account the different properties and capabilities of production with good culture, and without any additional expenditure; with the advantages and disadvantages of the different occupations, to let at the above-named price, which should regulate all future prices, if you once can determine how much in a given quantity of wheat, barley, or oats per acre a certain farm or farms will give for rent, according to the natural qualities of the soil, as I not only contend you can, but am quite satisfied it can be done, with as much correctness as you can set the rent in the usual way. When you have once arrived at this, you have overcome all your difficulties, and have attained a solid basis, as I before observed, which will last as long as civil society exists in Britain. The prices should range between ten and twenty pounds per load, for as observed in my first pamphlet, page 26, wheat is never likely to average a higher price than twenty pounds per load, on ac-

count of the great facility of steam navigation. I should say, without a great dearth, it will seldom, if ever, reach that price, and should it do so it will not continue long. I feel quite satisfied the occupation of the soil of this heavily taxed country cannot be carried on at a less average price for wheat than 14l per load, with full average crops, barley at an average price of 35s per quarter, oats at 26s per quarter, beans and peas at 40s per quarter. With the above prices, the malt-duty totally repealed, the tithe commuted and placed upon the after described system, and the currency put upon a proper basis, the occupiers would be able, by adhering to the strictest economy to meet their expenses. I shall begin with soil of an average quality, (see page 27, in my first pamphlet,) which will yield, if properly cultivated, two quarters six bushels per acre; although, as before observed, I have seen two able statements less by four bushels per acre than the above; one was from the central committee of Yorkshire, held at the end of last year; the other I cannot at this moment call to mind; two quarters six bushels per acre will give for rent at 6s 6d per bushel, or 13l per load, 16s 3d per acre. This sum, ranging between 10l and 20l per load, the charge for tithe should rise and fall with the price of wheat, between the above two sums. The tithe-owner would then participate with the land-owner, the occupier being subject to pay more or less, according to the rise and fall of the gazetted price, made up at Michaelmas, once a year, and taking the average for the whole year, which I conceive to be the most fair, plain, and easy way to go by. Having arrived at this, as I conceive, solid basis for rent, for I cannot suppose what can be brought forward to upset it; now follows the question, what portion or amount of charge upon the rent would be equivalent to the tithe-owner in lieu of tithes. Having seen and heard of different statements as to amount, some more and some less, where a portion of the fieldings was enclosed in the different western counties, I find that the portion set apart for the clergy was a sixth, but our lands having been long enclosed, and not being subject to this charge, I conceive, to do justice to the receiver as well as the payer, that one-fifth of the amount of rent for arable, and one-seventh for pasture of a certain quality, (a more ordinary quality should be charged but one-eighth, and the more ordinary but one-ninth,) would be a just medium between the payer and receiver, clear of any deductions, which should be as above stated, subject to rise and fall, between the two sums of ten and twenty pounds per load. I have no hesitation in saying it is first a just payment between the parties, and secondly one that is the very nearest the value that can be determined upon. Perhaps it may be said by some that one-fifth is too large a portion and too serious a charge upon the soil. In answer to that observation, I feel no hesitation in stating that the cultivator would gladly continue it rather than be either harassed or made liable to have the advantage taken of his improvements, by an additional charge, when such have been made. I would not recommend to make any difference in the two sums mentioned, where there was not more than twenty acres to the hundred in pasture; where there is that quantity of good sound pasture to the hundred acres it increases the value to occupiers, but over that quantity it should become subject to the latter payment, namely one-seventh part of the rent. Perhaps it may be said by some, why continue to charge me one-fifth upon the estimated value of my land as arable, as I have now

laid it down into pasture, it being more pleasant for me to do so, or it being a soil quite exhausted from cropping, and I wish to make trial of what resting and grazing will do for it. I would allow the parties to do so, and come under an exemption, but not until it had been laid down for three years; after that period it should come into the class of one-seventh, but not if there were not more than twenty acres of pasture to the hundred, for I feel fully persuaded that a larger amount can be drawn from one hundred acres of land where there is twenty acres of pasture, than a less quantity, or when the whole hundred is arable, deducting the different expences of the culture of the one and the other, with or without the pasture. Again, I find from my own reasoning and taking into account the cost of severing, horseing, and getting to market, that one-fifth part or amount of the rent is a full value or charge for the tithe, taking into account the certainty of the payment, the landowner being made subject to its discharge, which would at once supersede all losses, and would at all times be consolatory to the tithe-owner. One fifth is a full tithe where land is cultivated without artificial measures, such as chalk, lime, and other expensive manures, brought from a long distance, or by feeding cattle or sheep with cake and corn as before observed, and by expensive fencing, draining, &c.; all this assists the soil in producing an additional quantity of grain, which never did in justice belong to or ought to have been collected by the tithe-owner, whether clerical or lay.

From the best of information, and from the different calculations that have been made, it appears that the above named sums are the very nearest that can be determined upon as to the value of the tithe, as a rent-charge upon the soil. In endeavouring to arrive at a conclusion, I have had some hesitation, as my only wish is (not to trespass upon either party, either payer or receiver) that the tithe-owner should make up his mind to take something less than he would under the old system, which cannot be endured any longer, and which has caused so much unpleasant feeling between the payer and receiver, that it calls aloud for its immediate removal. It has been found and admitted upon all sides to have been a great hindrance in the culture of the soil. I find from inquiry that upon the poorer and heavy soils in this county, where they have been well cultivated, they have been paying a composition to the amount of near one-third of their rents, which is a most ruinous charge; upon the better soils they have paid one-fourth.

To explain it further, I will take a farm of one hundred acres—the rent at 16s per acre. The occupiers have been paying a composition of 4s 6d per acre, and upon the soil let at 20s per acre, a composition of 5s and in some cases 5s 6d per acre, which cannot be borne any longer, at the low price we have experienced for our produce. If we set the rent at 16s 3d per acre, and take one-fifth of the amount as charge for tithe, it gives 3s 3d per acre, which is a very full tithe, with wheat at 13l per load, for two bushels and two pecks per acre of wheat at 6s 6d per bushel gives the above sum. If wheat should again reach the average price of 16l per load, the charge for rent would be 2½ bushels per acre, at 8s per bushel, making 20s per acre; a fifth would be 4s per acre for the tithe, and where is the person who will not admit if he understands the expensive process of the

culture of the soil, that 4s per acre is not only a full, but a remunerative price for the tithe. When the clergy are made fully to understand that the present system of charge and collection of the tithe has done great injustice to the owners and the occupiers of the soil, they will, I feel persuaded, be ready to relinquish it, and be quite prepared to receive what is a just and fair portion of its fruits, after the expences of culture are deducted, and not be like the sons of the priest of old, who were not willing to take that part which was appointed for them, but thrust in the flesh hook, and took the best and fattest of the meat.

Perhaps it may be said by some,—where wheat is at the low price of 10l per load, two bushels and two pecks will give for rent 12s 6d per acre, and that one-fifth for tithe (2s 6d per acre) appears to be a low sum; but, in truth, it is too high, for it should be borne in mind that the soil, at the price of 10l per load, is cultivated, as shown in my first pamphlet, at considerable loss. The occupiers, since the year 1814, have not only experienced great losses in farming, but many thousands have been brought to poverty, whilst the tithe owner has received more than he was entitled to. Again, the tithe owner should bear in mind the ruinous low price we have experienced for several years past, and whether clerical or lay should be ready to help or bear a part of his neighbour's adversity.

It may be answered by somethat they have done so; and this I am quite ready to admit, but to nothing like the amount of loss experienced. This plan of alteration of the tithe would be consolatory to the tithe owner, inasmuch as he would be made acquainted with the amount, and knowing it to be subject to deduction only by the regulation scale by which it would be set, he could not complain.

A statement of the highest and lowest prices of Wheat, per imperial quarter, in *Rotterdam*, in each of the years from 1829 to 1836 inclusive; with the rate of fluctuation per cent in each year.

Years.	Highest Price.		Lowest Price.		Rate of fluctuation calculated on the Lowest Price.

## OPERATIONS OF THE POOR LAW AMENDMENT ACT, IN THE COUNTY OF SUSSEX.

REPORT OF THE AUDITOR OF THE UCKFIELD UNION, FOR THE QUARTER ENDING DECEMBER 25, 1835.

To the Board of Guardians of the Uckfield Union.

Feb. 13, 1836.

GENTLEMEN,—In the last report which I had the honour to present, I stated my impression that we might calculate on a reduction of 40 per cent on the mediums. My reasons for not placing the anticipated diminution at a higher sum were based on the uncertainty of the approaching season, which will always be found to affect the averages of expenditure in unions where the labouring classes are, like ours, so dependant on outdoor employment for the winter.

We are also peculiarly circumstanced with reference to what may be termed "*migratory labour*."

A very considerable number of our labourers find employment in the vicinity of London, and various parts of Surrey during the hay season, passing on afterwards to the South Downs for the harvest, from whence they return in sufficient time for their own; and as soon as the work connected with hop-picking is over, these men are left for three months in a great measure dependant on wood-cutting for support; an inclement season, a deep snow, cuts off the sources of employment and brings the whole weight of the consequent distress at once on our rates. Other districts reap the advantages of their labour, but escape the consequences of their poverty, the effects of the agues often contracted during the summer, the relief for sickness among the younger branches of their families who remain at home, and all those contingencies of pauperism attendant on the condition of the labouring classes.

In those districts, therefore, where these migratory labourers are non resident, greater regularity and more fixed reductions in the expenditure may be relied on: while ours will be found to vary with the uncertainty of the produce of our hop-plations, and the vicissitudes of the winter seasons, until the providence and fore-thought of the labourer shall have provided against such results.

These were considerations which induced me to speak with some reserve in regard to our reduced expenditure; but I freely admit, that had I known of the favourable season we were about to experience, my predictions would have fallen far short of those advantages which are daily discoverable, as the operations of the bill become more fully developed.

The annual average expenditure in the parishes forming this union, for the years ending 1831-32, and 33, from whence our mediums have been taken, produces 16,643*l* as the sum annually disbursed in parochial relief; this will show an average monthly expenditure of 1386*l*, while a similar average on the union expenditure, including the repairs and alterations to the work-houses, will be found not to exceed 550*l*, being a difference of 836*l* per month, by which it will be seen a saving of 10,000*l* per annum will be effected; and I will venture to assert, after having considered the question in all its bearings, that that sum may be looked on with reference to the ensuing year as a permanent reduction.

But the mere saving of this sum is not the only nor yet the most important point of view in which the changes of the law should be regarded; the moral reformation effected, by checks given to

vice, improvidence, and indolence—the stimulus offered to industry, and *the means it has left in the hands of the rate payers to reward that industry*—have solved the question of surplus labour, by proving (in this union, at least) that where there exists a wish for employment, employment is to be found.

In the month of December, 1834, in the corresponding quarter of last year, upwards of two hundred and fifty labourers were out of employment, and receiving relief in consequence for their families, although the state of the weather was not of such severity as at all to impede the usual routine of a labourer's occupations.

In the quarter just past, at the end of a week's frost, and when the snow had stopped most of the operations in agriculture, the greatest number of able-bodied men in the workhouses was twenty-eight; which asylum was sought by many, rather as a temporary refuge from the effects of circumstances, over which they had no control—from a suspension of labour, not from want of employment.

Yet among this number there were, as there always will be, more or less, some, who, from a long continued course of idleness and misconduct, could find no one to employ them, who has hitherto subsisted on parish pay, then derived from a fund which is now devoted to the remuneration of labour. The well-regulated system of employment, the irksome confinement, the discipline of our workhouses, and I trust a sincere desire to reform, has induced some who were unmarried to enlist as soldiers, and by thus entering the ranks in his Majesty's service, they now form part of that body of men whose duty it is to support and maintain those laws and that peace which but a few months since they were among the foremost to outrage and disturb.

It is not from these circumstances alone that we have proofs of the beneficial operations of the bill; it may be sought for from other sources—not in the encomiums of its friends, but in the complaints of its enemies, none of whom feel it more severely or complain more bitterly than the keepers of beer shops, and in short all that class of persons who were thriving on the improvidence and demoralization of the labourer, but who now suffer from his reform.

The great mass of those individuals who were so clamorous against the new enactments, on the ground of cruelty to the poor, are now silenced by the fact, that nearly two-thirds of the sum that they contributed, is left in their own hands, for their *own* distribution, according to their own discretion; to such as were sincerely actuated by the feelings they expressed, and who concealed no sinister motives under the mask of charity, it must be gratifying to reflect that the sum formerly abstracted from the funds of private benevolence is thus restored to its natural channel; those humane persons will not have the satisfaction of dispensing that relief as charity, to be received with gratitude, which was formerly claimed as a right, and exacted by intimidation.

The shop-keepers who so strongly opposed the new measures have not found, in the result, the ruin they seemed to anticipate; with the exception of the contracts for flour, and the supplies for the workhouses (which no doubt will always continue,) they will find the bulk of the expenditure among the labouring classes, passing, as it has hitherto done, through their hands, with this difference however, that instead of having the

paupers' interest in the parish pay assigned to them, or, in other words, making the rate-payers, indirectly, become security for the paupers' debts; they will have to trust to the credit of the persons with whom they deal, which credit being measured by character, in showing the labourer its value, will teach him the necessity of its maintenance.

I shall avail myself of this opportunity to offer a few observations on the workhouses:—

I have remarked, in those allotted to the aged and infirm, the dress as directed by the regulations is not adhered to, and, on enquiry, find some parts of it only adapted to summer wear. I would submit to the board the propriety of correcting what appears to have been an oversight, and at the same time would suggest, for their consideration, the advantage of adding a round frock, as a warm and durable addition to the dress of that class of male paupers; I would not, however, recommend any alteration as respects the able-bodied.

If the stuff, which if possible should be distinguishable from that in common use, were purchased in London, the making of round frocks would afford employment for the girls in the school.

The junk which has been picked in the various houses might, I apprehend, be converted into rope-yarn, and a ready sale found in the neighbourhood for the bark-harvest, thatching, sack-ties, and other purposes. It costs, including carriage, less than 2d per lb, which price will allow for its loss of weight in picking; when made into rope-yarn it is worth 6d per lb; assuming that a man will pick 3lbs per diem, which is a low average, there will be a profit of 1s, from which will have to be deducted the labour of spinning, and the value of the tar used in its manufacture. I speak with hesitation of a subject on which I have not been able to obtain much information, but, from what I have learned, I think it both practicable and profitable, more so than by sending it for sale to Chatham or Newhaven, by which the expense of a long carriage will be incurred.\*

It would be superfluous to call your attention to our schools, the management of which has so often been noticed with approbation;—the system of teaching the children not only reading and writing, but such other things as may be useful in after-life, has induced me to advert to them, because we have in our workhouses partly disabled paupers, who might instruct the boys in broom and basket making, for the supply of the houses belonging to the union; it will be a matter for the consideration of the board whether any shall be publicly sold; but if, by that sale, a check were given to the practices of such vagrants as now obtain their subsistence by cutting and stealing under-wood for that purpose, it will be rather conferring a benefit on the public than inflicting an injury on trade.

I refer, with great satisfaction, to the state of the accounts, as kept by the paid officers of the union, which have exhibited, throughout, a care, attention, and accuracy, that demand my notice and acknowledgments.

I have to regret so much delay has been incurred in the transmission of the abstracts required by

the central board, for the expenditure of parishes in this union, in the corresponding quarter of 1834; but at the end of three weeks examination, experience has confirmed what my fears had anticipated—that the accounts of unlettered men, shopkeepers' bills, and the *chaos* of a parish chest, were by no means subjects from which the necessary returns were to be obtained, with the dispatch and accuracy I could have desired.

Where, however, my researches have not been so satisfactory as regards *figures*, I have endeavoured to supply the deficiency by *facts*; and for this purpose I have laid on the table an abstract of answers to several questions relative to what was formerly supposed to be "surplus labour." In calling your attention to it, I ought, perhaps, to observe that *no direct proportion exists between the sum paid and the number out of employment*; the amount of relief is a criterion only as regards the time for which a certain portion of this surplus labour was paid; neither will that afford a sure basis of calculation, as the scale of payment for parish labour was formed, not on the *earnings*, but the *family* of the pauper, varying from 6s to 9s per week. It is not, therefore, possible to arrive at any accurate result as to the amount of the expenditure under that head, in the years from which the mediums are taken; but I have no hesitation in expressing my conviction that it equalled the whole amount of our present relief for the two winter quarters.

The characters of the majority of those admitted into the houses for the able-bodied men, were such as to offer serious obstacles to their obtaining employment; one had already been convicted of felony, two were sent to prison from the workhouse, another was discharged for misconduct—few good characters entered—none remained long: it would be found, if the history of all were diligently enquired into, that the greater part were but the dregs of able-bodied pauperism, which the new system has so effectually strained off.

If, therefore, this question of "surplus labour" be at once set at rest, then the other questions, whether of migration or emigration, will also be answered, and thus, by degrees, disencumbering ourselves of these surplus subjects, we shall be enabled to devote a more undivided attention to such as remain.

I cannot conclude these observations without adding my humble testimony to the assistance afforded by our late vice-chairman, in directing the alterations so judiciously effected; it is his talent and perseverance, aided on all occasions by your experience and support, that have so materially conduced to those satisfactory results which have hitherto marked the formation and progress of this union.

I have the honour to be, Gentlemen, your obliged and obedient servant,

W. H. NEWHAM, Auditor.

### THE IRISH POOR ENQUIRY.

The third report on the expediency of a Poor Law for Ireland, just published, contains the following statements:—

"There were in Great Britain, in 1831, 1,055,982 agricultural labourers—in Ireland, 1,131,715; although the cultivated land of Great Britain amounts to about 31,250,000 acres, and that of Ireland only to about 11,600,000. We thus find that there are in Ireland about five agricultural labourers for every two that there are for the same

\*The experiment suggested has since been tried, but from a difference in the qualities of the junk, sufficient dependance could not be placed in the rope-yarn to justify an expectation that it would be brought into general use.

quantity of land in Great Britain."—(First Section.)

"We cannot estimate the number of persons in Ireland out of work and in distress, during thirty weeks of the year, at less than 585,000, nor the number of persons dependent on them at less than 1,800,000 making in the whole 2,385,000."—(Page 5.)

According to the Census Returns of 1831, there were then in Ireland, 1,867,765 male persons, aged twenty years or upwards, of all classes.

1. Capitalists, bankers, professional men, and other educated persons . . .	61,514
2. Manufacturers and machinists . . .	25,746
3. Occupiers of land, who employ labourers . . . . .	95,339
4. Occupiers of land, who do not employ labourers . . . . .	564,274
5. Agricultural labourers . . . . .	567,441
6. Retailers; and handicraftsmen, masters, and workmen . . . . .	298,838
7. Labourers, not in agriculture . . . . .	89,876
8. Other males, twenty years of age, except servants . . . . .	110,595
9. Servants . . . . .	54,142
<b>Total . . . . .</b>	<b>1,867,765</b>

The labourers and workmen in classes 5, 6, 7, 8, and 9, (deducting the retail traders, and the masters from No. 6) cannot be estimated at more than 900,000; it is manifest, from the above classification, that the whole of the workmen in Ireland, depending for subsistence on employers, must be under one million.

The Commissioners have assumed that occupiers of land, who do not employ labourers, are themselves depending on employers, and by adding this class (No. 4) to the actual labourers, they form their total of 1,131,715 agricultural labourers, in which they have committed an error that falsifies all their subsequent computations. They admit this error impliedly in section 9, by proposing that model farms shall be established in every district, to improve the husbandry of these occupiers, whose lands, they say, do not produce a third of their capacity.

A large number of these occupiers who do not employ labourers, are wholly engaged in cultivating their land; many are residents of towns who hold two or three acres of pasture for their cows; a great number are weavers, and hence there are more of such occupiers in Ulster than in the other provinces; some are carpenters or masons, butchers, fishermen, &c.; and only a few work for hire, who are generally first class labourers, as gardeners, ploughmen, mowers, &c. It is then clear that the Commissioners have exaggerated, by more than half a million, the number of agricultural labourers in Ireland.

Relying on this erroneous computation of the number of labourers, they have assumed that there are 585,000 out of work, during thirty weeks of the year: which cannot be, unless every second workman of the actual number in the country be idle on more than every second day. On the same basis they have founded the assertion that there are five agricultural labourers in Ireland for every two in Great Britain, on the same quantity of land. There were in 1831, 387,167 British agricultural labourers, and thirty-eight acres for each labourer, while in Ireland there were twenty acres, deducting the quantity occupied by small farmers; but the Commissioners have pointed to the fact, that

the British labourers are not sufficient for the husbandry of the country, without the aid of Irishmen. The number of British labourers does not therefore indicate the number required in Ireland.

The following table, compiled from the Census Returns of 1831, shows the totals of agricultural occupiers and labourers then in Ireland, the quantity of land in use, the quantity occupied by persons not employing labourers, the quantity in the hands of employers, and the number of acres for each labourer, in each province:—

The Irish Provinces.	Occupiers of Land who employ Labourers.	Occupiers who do not employ Labourers.	Agricultural Labourers.	Reclaimed Land. Statute Acres.	Waste Mountains and Bogs. Statute Acres.	Reclaimed Land held by Occupiers who do not employ Labourers, allowing to each Occupier Five Acres.	Residue of the Reclaimed Land, held by Employers.	Average number of Acres held by each Employer.	Number of Acres of the Land in column eight for each Agricultural Labourer.	Number of Acres of the Land in column five for each Labourer and each working Occupier.
All Ireland . . . . .	95,339	564,274	567,441	14,603,473	5,340,736	2,821,370	11,782,103	123½	20½	13
Leinster . . . . .	20,789	87,819	162,417	4,119,160	635,424	439,095	3,680,065	177	22½	16½
Ulster . . . . .	29,301	189,087	120,795	3,749,252	1,469,922	945,435	2,803,917	96	23	12
Connaught . . . . .	11,806	167,100	71,882	2,805,109	1,330,022	835,300	1,969,609	167	27	11½
Munster . . . . .	33,443	120,268	212,347	3,929,852	1,905,368	601,340	3,328,512	99	15½	11½

Were the Commissioners correct in assuming that there are in Ireland 1,131,715 actual labourers for hire, there would be for each the number of

ing in column 11, giving an average, for the whole country, of 13 acres of the *reclaimed* land. And by column 10 it is shown that there are in the hands of *employers* 22½ acres of *reclaimed land* for each actual labourer in Leinster, 23 acres in Ulster, 27 in Connaught, 15 2-3 in Munster, and 20 acres on an average of the whole country.

Emigration is, nevertheless, recommended by the Commissioners. But in 1835 a Committee of the House of Commons, on Irish public works, which included all the leading Irish Members, with Mr. O'Connell and several British Members, with Sir Robert Peel, reported that emigration is unnecessary, and would be impolitic—that in 1728, when the population of Ireland had only reached a fourth of its present extent, the labourers were even then excessive for the system of *husbandry*—and that emigration must be impolitic while the empire is under a load of taxation and debt which only a large population can sustain.

The Commissioners, in recommending emigration, have not reflected that pasture tracts would be extended as the labourers would be removed, and that the remaining labourers could not, therefore, have more employment.

Reclaiming waste mountains and bogs is also proposed; but the Commissioners do not adopt the cautious policy of the Parliamentary Committee on Irish public works, by recommending legal and other facilities for enabling landowners to reclaim wastes at their discretion; they recommend that these wastes shall be partitioned, surveyed, and valued, by Commissioners appointed for the purpose, on *the mere motion* of Commissioners of Improvement, and that then main drains and roads shall be formed through them by the Commissioners of public works. There are thus to be three sets of Commissioners for improving wastes, at the pleasure of the Projecting Board, with a Court of Review, to which proprietors may appeal, consisting of the two principal Commissioners of Improvement and two of the Judges.

Mr. Daniel O'Connell, Mr. Spring Rice, Mr. Lynch, and the other Irish and British Members of the Public Works Committee of 1835, thought of no such machinery as this for reclaiming wastes. They, however, proposed means equally efficient, but much less expensive; they proposed that the Board of Works already existing should contract to reclaim available wastes, so that proprietors might be induced to improve by having a public Board to assure them against imposition and extravagance; they also proposed that juries should be empanelled, when necessary, for adjusting rights and valuing interests.

But whence are labourers to be procured for the arbitrary and enlarged operations proposed by the Commissioners? Must the lands already in tillage be converted into pastures? It would appear that the cottier farmers, the working occupiers, are not to be invited from their present vocations. They are to have model farms (section 9) established "in every parish or district" for improving their husbandry. If, then, a large portion of these cottiers are not expected to abandon their present holdings, and reclaim wastes, the regular agricultural labourers should be invited. If the former should go, what will become of the lands they occupy, and the rentals? If the latter should go, how could the rack-rent farmers pay the wages which the remaining labourers would naturally demand? And, finally, when large tracts of wastes (for there are three millions of acres *available*) should be added to the present cultivated territory, increas-

ing every kind of agricultural produce far beyond the local demand, what would become of the rents now derived from land in use?

Were there to be all the emigrating, migrating, and reclaiming, to be projected by a Board *paid for the purpose*, the present rack-rent farmers of Ireland could not pay their rents; and the owners of reclaimed land, who have not large tracts of wastes, would be deprived of so much income, that those under heavy settlements and mortgages would be ruined.

The Commissioners would invert the natural progress of territorial improvement. Instead of cultivating properly that which is now improved a little, they propose to improve that which is now waste, and invite industry to abandon the territory which is under cultivation. Still they report that there is in the reclaimed land a great capacity of production not yet developed.

But the capacity of increased production, in the land already reclaimed, cannot be put into operation, without a reactive Poor Law, to enforce the employment of sufficient labour, and prevent an abuse of the sources of subsistence; and this law Ireland is not to have.

Landlords may still expel the cultivators of the soil with impunity. Large tracts of reclaimed land may still be shut up from industry, without a penalty. And when labourers are cast on the world by the caprice or indolence of a landholder, or the occupancy of more land than he has capital to cultivate, they may starve, or seek for work on waste lands, probably in another province, *which work may be given or withheld at pleasure*; or they must solicit admittance to a depot for emigrants.

Two or three instances of abuses under the English Poor Law are quoted in the Report; but although the causes of the evils pointed to were accessible to the Commissioners, they have not been placed before the public.

In England abuses have been as largely detected in the administering of relief to the *helpless* poor, as in managing the provision for poor labourers: why are the Commissioners alarmed *only* by abuses of the latter? "*Instructed*"—by unexplained occurrences in the parish of Cholesbury, where population has not increased since 1801, when all its poor were supported for less than 36*l.* a year—and by some strange transitions in habits, alleged to have happened in one other not named—they will not recommend that Irish labourers shall be protected against want and injustice by a legal right to employment. But, notwithstanding the abuses in administering the provision for the *helpless* poor, they recommend *that relief* for Ireland. Why? They ought not to be scared by abuses in one case, which do not deter them in the other. And they are surely aware that the abuses of an institution are not sound reasons against its existence; if they were, our Legislature, juries, and corporations, ought to have been abolished rather than reformed.

The Commissioners assume that England sustains the pressure of her Poor Law *only through her strength*, and that Ireland is unfit for such a law in her weakness. They say—"Because extraordinary strength has withstood *poison* it does not follow that *poison* should be prescribed as a remedy for weakness"—forgetting that the *poison* of a Poor Law was administered to England when she was more distracted and feeble than Ireland is now—when she was borrowing capital from the Dutch, and her peasants were roving in marauding bands through each of her counties.

They foresee that a reactive Poor Law, to enforce work for all who want it, would increase the outlay in wages; and they calculate that the present product of the country could not provide for the augmented outlay. But the additional labour would create an additional product, to compensate employers, as the labour of every new settler in America enables the community to provide each year for an increased expenditure in wages, and to realize a profit on the capital so employed.

Instead of a reactive Poor Law, which, by providing work up to the capabilities of the country, would not only diminish pauperism now existing, but check the creation of pauperism, and increase the agricultural produce, *without disturbing and overturning settled interests*—the Commissioners propose to create a fund, by taxation, for helpless paupers, reduced to beggary (for the most part) by the absence of a *reactive* protection for the working classes. In this project they would lay the foundation of a system, which must be rapidly and continually extending until its expense would become insufferable.

If this provision for helpless paupers only be created, England will get the labour of many an Irishman, whose infirm parents or deserted children, must be supported by Irish taxes. But establish in Ireland a provision for the poor, including *a right to employment*, for the working classes, and then the law can justly compel every man to support his immediate kindred, as it does now in England. And for such a law no complicated and expensive machinery is necessary. Rate-payers ought to be empowered by it to elect local bodies for carrying it into effect; and some public department already existing should have a controlling power over these bodies to enforce the rights of the poor, and protect the interests of the community.

## ON THE DIFFERENT THEORIES OF MILDEW.

TO THE EDITOR OF THE YORK CHRONICLE.

SIR,—On no subject have scientific and practical men more disagreed, than on the causes of mildew in corn; some attributing it to animalculæ, some to parasitical plants, and others to the variations of season, frequently placing effects for causes, and altogether offering a series of confused scraps of observation, rather than any digested system, formed upon accurate and practical principles. The diseases of corn have not been so systematically arranged as they should be, and mildew, rust, blight, and smut, have been confounded with each other. Mildew has, however, its peculiar characteristics:—it is a spotted discolouration of the straw,—it is at its commencement, and afterwards black, and scattered in patches over the surface, and although its effects seem principally confined to the straw, yet the moment it is fixed, all communication between the juices and the ear is cut off, and the corn derives no more nutriment. It is admitted on all hands, that whatever may be the immediate cause, the season has much to do in inducing it. One theory is, that if the weather be dry in the months of May and June, the vessels of the stem are small, in consequence of the languid propulsion of the sap from the root, and if the weather then changes to rain, the secretion of sap is increased, until the capillary vessels are incapable of conveying it, which causes a determination of it to the skin, and it being the natural food of some

parasitical plants, they attach themselves to it and produce the disease. This, however, appears somewhat strained, and cannot be easily reconciled with the fact of certain parts of a field being affected, and the rest perfectly free, as was the case with a field which came under my own observation. Particular districts, too, are particularly affected, while those around are comparatively free. One village was so notorious for this disease, as to get the opprobrious character of “Mildew Rollesby.” This is quite opposed to the determination of sap to the surface of the straw by the peculiarity of the season, as producing the disease. Others attribute it to the too vigorous growth of the plants, which would indicate a more sparing application of manure, but in direct opposition to this, we observe small and stunted ears affected, as well as more luxuriant ones. Another theory is, that insects, or plants, are produced on the ground, which climb up the plant and feed on its juices. But if this were the case, the corn would be affected all seasons the same, and seldom if ever escape. A mist or fog, in July, is almost sure to produce the disease, and if it was attributable to animalculæ, all parts of a field would be diseased, which is contrary to facts.

The above are the most fashionable modes of accounting for this disease, but they are very unsatisfactory, and what is worse, they hold out no possibility of eradicating, or even diminishing, its ravages. I am inclined to favour the opinion that it is the same disease which attacks other plants, and from them is communicated to the corn, in the manner afterwards described. The coltsfoot (*cacalia*) may be observed at a later period of the year, to be covered with yellow spots, which afterwards occasionally turn black, and very much resembling the disease in corn, above alluded to. Scientific men, however, tell us that they observe a difference in the microscopic appearance of the fungi; but may not this difference be attributed to the juices on which they feed? This theory is connected with the season in a way altogether simple, and quite different from any of the above. When the straw is wet for a considerable time, the floating seeds of the fungi are attracted to the corn and straw, which it would not be in a dry season. In proof of this, it may be remarked that that peculiar kind of wheat called “downy-chaffed,” is so peculiarly liable to the disease, as to induce the Scotch farmers to discard it; the chaff being more retentive of moisture, is more attractive to the fungi. The coltsfoot, and certain other plants, which seem peculiarly liable to the infection, as wheat is more than oats, act as conductors of the seed; and it is at least worth while for the farmers to clear their land and hedg's of such noxious plants, as a single neglected farm in this respect, may extend the disease for miles, especially in foggy weather. M. M. M.

Thorpefield, April 26, 1836.

THE WEATHER.—Last evening, a self-registering thermometer was laid on the ground in the garden, and this morning the index stood at 23 degrees: that is the *minimum* temperature was 9 degrees below the freezing point! At about 5 in the morning the temperature was 27 degrees; at the same time the atmosphere was bright, with the exception of a few stratus clouds to the northward. A temperature of 9 degrees below the freezing point, at this season of the year must have a very detrimental effect on vegetation.—Epping, April 30.—Standard.

## ISLINGTON CATTLE MARKET.

TO THE EDITOR OF THE MARK LANE EXPRESS.

*London, May 20th, 1836.*

SIR,—We the undersigned, have had the gratification to visit the Islington Market, and unanimously agree that it is the most perfect, commodious, and convenient Market in the kingdom, and which every Grazer who studies his own interest and welfare will support, and we strongly urge and invite them to see the new Market and judge of its merits for themselves, and they must be convinced, as we are, that it is for their benefit that their cattle should be sent there, where they can have every comfort and accommodation which cannot be obtained in any other market.

We cannot bestow sufficient praise on Mr. Perkins for the high spirit he has evinced in the erection of an establishment equally important and advantageous to the agricultural classes, as it is for the improvement of the metropolis, and we heartily wish him every success, and we hope that the whole of the stock sent for the supply of the London Market may very shortly be consigned to the New Market at Islington.

We remain, Sir,

Your obedient servants,

NORFOLK, Earl Marshal,

TAVISTOCK, Marquis of,

LYNEDOCH, Lord,

Mr. COKE, Holkham, Norfolk,

ROSEBERRY, Earl of,

(FROM A CORRESPONDENT.)

## ISLINGTON CATTLE MARKET.

I congratulate my agricultural brethren on the unity of feeling that prevails in our county, relative to this important and praiseworthy undertaking; having been present at a meeting of landowners and graziers, which took place at the Peacock Inn, Boston, on the 18th instant, the Great Fortnight Cattle Market, convened for the purpose of conferring with a deputation from the London Salesmen, who have transferred their business from Smithfield to Islington, in compliance with the wishes of their employers expressed in the declarations of the graziers in Lincolnshire, and other counties, pledging themselves to send their cattle to the Islington Market.

JAMES B. TOPHAM, Esq, having been called to the chair, and the object of the meeting having been stated by the Salesmen who were deputed to attend, it was unanimously resolved, that this meeting are fully determined to support the Islington Cattle Market, and, moreover, that we will not employ any drover who shall presume to deliver any cattle contrary to our directions, or sell any stock entrusted to their care, except in the market to which it is consigned.

Many very judicious remarks were made on the conduct and trickery of the drovers who have been opposed to the New Market. It was suggested and approved by the meeting, that committees be immediately formed at all the principal markets throughout the country to confer with the Islington Market Committee in London, on the most effectual means of supporting the Islington Market.

The feeling that prevailed in this meeting was so truly unanimous, that when a show of hands was solicited in favour of Smithfield Market by a Salesman from London who attended the meeting with three others as the advocates of that market, not a single arm was raised in support of this detestable place, where the property of the graziers of England have been so long sacrificed to the interest and prejudice of a few individuals.

This meeting which was attended by upwards of one hundred of the most influential landowners and graziers in this part of the county of Lincoln, together with the declarations which have already been signed by nearly one thousand landowners and graziers in Lincolnshire,

pledging themselves to support the Islington Market, cannot fail completely to establish the opinion that prevails in this county on this important question.

While writing, I must take leave to put my brother graziers on their guard against reports that have been industriously circulated by certain jobbers (and the salesmen in their employ) transacting considerable business in this and the adjoining counties, prejudicial to the Islington Market. These men may calculate on reaping a golden harvest by endeavouring to keep up a competition between the two markets, they imagine they may have the effect of inducing graziers to sell at less money at home; this feeling will at once account for the extraordinary apostasy of certain individuals who are seeking, while the two parties are contending, to walk off with the bone.

Graziers, forget not the ancient motto, "Vis Fortier Unita."

*Boston, 20th May, 1836.*

The effect of a commutation of title in inducing the ploughing up of poor lands is thus animadverted upon in a little pamphlet upon this subject from the pen of the Rev. R. Jones, Professor of Political Economy at the East India College.

Since 1814, more than four millions of souls, that is, a population greater than that of Sweden and Norway, has been added to the consumers in our home-market; and yet, during that time, there has been a disposition rather to lay land down than to plough it up. The additional produce, gigantic as the addition has been, has been obtained by better, not by more extensive tillage farming. And yet, the one great improvement, by the application of which modern agriculture has added so enormously to its powers, has been adopted on only a very moderate portion of the English soil. That improvement is the alternating with corn, on the tillage-grounds, crops on which cattle are maintained. The progress of such a practice is possible only in countries where there is an increasing demand for butcher's meat, but where such a demand exists, its gradual progress to soils of all descriptions, after it has once become known, may be anticipated with great confidence. Hitherto it has been almost confined to light and dry soils. Perfect draining is the condition on which alone it can be attempted on stiff and wet land. The great expense of drainage has, hitherto, been an effectual obstacle to the general participation of such soils in the benefits of the improved husbandry of the day, and we see the occupiers of them struggling with difficulty to maintain them in cultivation at prices produced by the abundant harvests of their more fortunate neighbours. But the art of draining is, as might be expected, improving: already the operation may be effected in the very best and most effectual manner, on the stiffest soils, for one-third of what it cost a few years ago. The next great conquest of English agriculture will clearly be on such soils. Root crops, and summer and winter soiling, producing, necessarily, more perfect tillage and progressive enrichment, may gradually restore the clays to an equality at least with the lighter lands, if not to their ancient and once vaunted superiority.

**POLISH TURNSPITS.**—Bears are very common in Poland; the peasants catch them when quite young, and teach them to perform all sorts of domestic labours. These animals, possessing great intelligence, and dexterity, particularly with their fore-paws, many inn-keepers have bears who adroitly turn the spits for roasting meat. It is an extraordinary sight to see a stranger who enters one of the Polish kitchens to see a bear seated gravely on his hind-legs, and turning with his fore, an immense spit, by means of a handle artistically constructed.—*Le Caméleon.*

## SECOND REPORT OF THE COMMITTEE ON AGRICULTURAL DISTRESS.

MR. HOWARD called in and examined.

Can you speak of the comparative condition of the farmers now and 20 years ago?—Twenty years ago the farmers were a very flourishing body, they were opulent; they are now dreadfully poor.

Do you think there is much capital yet left in the hands of the farmers?—I believe that were the landlords to call for closing in of the accounts, were all accounts now to close, the farmers of Holderness and Howdenshire are insolvent, taking them as a body.

Speaking of Howdenshire and Holderness, are there any particular expenses attending their cultivation, are the rates heavy?—No; the rates in the East Riding I do not consider to be very heavy; it appears to me they are much higher in the south of England than in Yorkshire.

What are the poor rates in that part generally speaking?—Varying considerably, perhaps about half a crown, judging from those parishes with which I am acquainted; I should say not much above half a crown in the pound.

Is the county rate heavy?—The county rate has very much increased, but it is not a very serious evil.

What is it in the pound?—I mean in the half a crown or 2s 8d to include the county rate.

Is the tithe heavy in that district?—No, very little tithe is paid, it is generally tithe free.

If the tenantry have been in this declining state so long, has there been a corresponding reduction in rent in that district?—I should consider that rents have fallen about 40 per cent.

Since what period?—Since 1816.

If the prices which have been maintained the last year or two should remain, how much more rent should you conceive would have to be reduced?—The poor strong lands could not remain in cultivation rent free.

And the extent of country to which that would apply would be about 50,000 acres?—Yes.

And that land has been in cultivation time immemorial?—It has.

Do you think the richer soil, and yet strong soil of Holderness will bear much rent if the present prices remain?—It will not bear much rent, but certainly it may be kept in cultivation.

Twenty years ago what rent would an acre of the average soil in Holderness bear?—Thirty shillings.

What do you think it is worse at the prices of the two last years if it was let at the price of wheat?—If they are paying 20s they are paying part of the rent out of their capital.

If they did not pay their rent out of their capital what do you think that 30s must now be reduced to if they pay merely according to the value of the produce?—I feel that rather a difficult question to answer.

You say there has been a great scarcity of spring crops, and therefore the value of the spring crops has not made up for the loss upon the wheat crop?—No, the spring crops have borne a pretty good price, but the crop itself has been very deficient, and therefore the farmer has not benefitted much by the price that he has obtained.

In former times, even before the war, used not the wheat crop to be considered the paying crop?—Certainly.

And of late years the farmer has been obliged to compensate himself out of his other crops to pay for the cultivation of wheat?—That has been the case to a certain extent.

Have you made any observation of the changes that have taken place since the year 1814, as to the welfare of the farmer; how was it immediately succeeding the war?—The farmer bore up pretty well till 1816; in 1816 he had more difficulties to contend with; in 1815 he had a considerable reduction of price; and in 1816 the harvest was exceedingly bad, he had a great deficiency of quantity; 1816-17 was a year of scarcity. I think the prices in 1817 rose rather considerably.

Did they remain high during the year 1818? There was a fall in 1818.

When did any great fall take place after the year 1818?—I think in 1820, 1821, and 1822, and in the early part of 1823 prices fell greatly.

Was there a great pressure then upon the farming interest?—Great distress.

Was the price low?—The price was low, and altogether there was very great distress.

Did the lowness of price in your opinion spring from good harvests or from abundant crops?—I think not; if it had done so the farmers would not have felt it so much; the quantity grown would have compensated for the decrease of price.

Do you generally find that the farmers, as a body, reap more benefit from an abundant and good harvest with a comparatively low price, than they do from a higher price attending a scarce crop?—Decidedly.

Do they consider a good harvest a blessing?—A good harvest is a great blessing.

Did any material change take place after the early part of 1823?—In 1822 it appeared to me that I could not go on farming, that ruin must be the consequence, and I was losing very seriously; at Lady-day, 1823, I gave up the greater part of my farming concerns, but the prices, though very low in the spring of 1823, rose afterwards during the year 1833.

There is still another article which agriculturists produce, namely, meat, which is selling higher than wheat; to what do you attribute that?—The great scarcity of mutton; the flocks being so much reduced of course made a greater demand for beef, and I imagine that it is from that circumstance alone. There is another thing too which must operate; as the distress of the farmer and the difficulty of letting farms increased, and as rents in consequence decreased, landlords began to indulge their tenants very much by allowing them to plough up grass land. We have much less old grass land in the East Riding of Yorkshire than we had during the period of prosperity; that must tend to increase the price of cattle.

Will not that also have the effect of increasing the breadth of wheat sown?—Yes, no doubt it has.

Has wheat been sown to a much greater extent than it used to be within the last five or six years?—The autumn of 1834 was peculiarly dry, and there was great difficulty in getting wheat sown; I found that many farmers, not only in the East Riding but in Yorkshire generally and in Lincolnshire, and in other parts of the country, had been partly compelled to abandon the sowing of wheat from the difficulty of getting a season in which it would vegetate; they were the more ready to do so because wheat was then selling at about 40s, and spring crops were selling at much better prices in proportion, and therefore they allowed their strong land fallows to stand over for beans, for barley, or for oats, and consequently less wheat was sown in the autumn of 1834.

Would the fact of a considerable number of farms having been left waste for the last three or four years have diminished the quantity of wheat sent to market?—Certainly; then, again, those farmers that were compelled to sow spring corn in 1835, instead of sowing wheat in the autumn of 1834, finding that

those crops had been more profitable to them than wheat crops would have been, have gone on this year to do the same to a very great extent, and others have followed their example, so that the breadth of wheat sown in the autumn of 1835 has been very much diminished.

Do you think that the diminution in the sowing of wheat has at all tended to raise the price within the last five or six weeks?—I believe wheat is not just now rising; it is a fact that must be generally known, and the merchants and others must be aware that a considerable change will take place, that there must be a deficiency of wheat in proportion to the spring corn; spring corn has been so much more sown, and wheat so much less sown, that their present ratio of price must alter.

Speaking practically, do you find any inconveniences from the country bankers not issuing so largely as they used to do?—I used to have good personal credit with my bankers, I used not to be asked for any security, nor feel it necessary to look at my banker's book to see how I was going on, but I should very much scruple now to overdraw upon my bankers.

Do you think the tenants generally find the same thing with the bankers?—Yes, the tenants have no credit.

Can they get security to enable them to get accommodation from the bankers?—No, it is impossible.

Why?—They have lost confidence in the country: the bankers know that they are poor, and they have no longer confidence in them.

Is the man who would naturally be the security of a farmer a neighbouring farmer?—Yes.

Then you think that all the farmers are so much distressed that one farmer could not be security for another?—A farmer's personal security will no longer be accepted; it was the habit formerly of the bankers to advance money to any man, whom they knew to be a prudent man, if he brought the security of such a man as himself, but ten such securities now would not induce the banker to advance his money.

Is that because he thinks farming a ruinous trade?—Because he thinks farming a ruinous trade. Formerly he depended upon the prudence of a tenant, but he can no longer place confidence in his prudence, because he knows that he carries on a business by which he must lose money.

You have spoken of the condition of the tenants; what in your opinion is the condition of the landlords at the present time?—The landlords whom I principally know are, I conceive, in a much worse condition than their tenants.

Will you state why?—Because many of them are compelled, by their situation in life to a certain expenditure; many of them have mortgaged estates, or estates otherwise encumbered; all the incumbrances remain the same. A reduction may have taken place upon mortgages, from 5 per cent. to 4 per cent.; but the rents having decreased 40 per cent. in many instances I could quote 50 per cent. upon the strong cold lands, the landlords have suffered more than the tenants.

Do you think that the landlord himself has not been living, in a certain degree, out of the capital of his tenant?—Yes, he has so; but with a reduction in his rent of from 40 to 50 per cent, that has not enabled him to meet his unavoidable expenses.

Then you think the comparative condition of the landlord is worse than that of the tenant?—The comparative condition of the poorer landlord is worse than that of the tenant. I know many instances of freeholders, who were men that possessed property, to the amount of 8,000*l* or 10,000*l*, who are now ut-

terly destitute, who have not a shilling in the world.

Can you give an instance of two men, who should happen to have invested money, the one in the funds, and the other in land, about 20 years ago?—A gentleman with whom I am very well acquainted, and whose estate has been in my management, since he purchased it, about the year 1809, sold out of the funds to purchase that estate. The purchase was about 50,000*l*. The value of the estate has been sunk altogether by the difference that it would have made to him had he continued his money in the funds up to the present time.

Do you mean then to say, that if it had remained in the funds to this time, his 50,000*l* would have become 100,000*l*?—I know what the rental has been; I know what the expenses of the improvement of that estate have been; and calculating what he would have received from the funds. I find that it makes the difference of the cost of the estate.

If he had remained a fundholder, he would have been 50,000*l* richer at the present time?—Exactly so.

What do you conceive to be the condition of the labourers now?—I do not think that the labourers are distressed at all.

Are they well employed?—They were distressed for several years prior to 1824, and then emigration became with us so general, and was carried on to so great an extent, and took so many labourers out of the market, that they have pretty good employment.

Are the labourers, generally speaking, in the East Riding, well employed, and taking the price of produce, well paid?—Taking the price of produce, well paid; better paid than at any former period.

What is the rate of wages they are receiving, generally speaking, in the East Riding of Yorkshire?—Two shillings a day, throughout the year, may be considered about the price of wages, in the East Riding of Yorkshire.

What is the state of the tradesmen in your neighbourhood?—I reside not very far from York, and I am most acquainted with the tradesmen in York; they complain very heavily. On inquiring as to an agricultural petition which was recently sent up from the Yorkshire associations to the House of Commons, I found that the shopkeepers in York were much more anxious to sign that petition to parliament than the farmers were. They have learnt that they are entirely dependent upon the landed interest, and that if the landlords have not money, and if the tenants have not money, they can sell no goods.

Is not that rather a change in the opinion of the tradesmen?—Decidedly so.

Since when have they changed their opinions?—I recollect that when corn was extremely high in 1812, and about that period the shopkeepers used to complain heavily of it, and fancied that it was very much to their detriment; they are now convinced that without corn can be sold at a remunerating price, they cannot carry on business to advantage.

Then, in fact, you yourself think they are as much interested in the relative state of prices as the farmer, the labourer and the landlord?—I am confident that they are.

Do you believe that it would be possible for the county of York to grow wheat to advantage at 5*s* 6*d* per bushel, tithes free?—Certainly not.

If the whole of the poor rate, county rate, highway rate, and every other rate, were removed from the county of York, do you think that they could grow wheat at 5*s* 6*d* or 5*s* 9*d* per bushel?—Certainly not.

Do you think that 5*s* per bushel is a fair estimate to make for a series of years?—I should hope not.

Do you think that wheat will remain at 5s per bushel, or that it will not increase in price?—Wheat will increase in price, I believe, from the small quantity sown, and from the impossibility of cultivating it at that price, so that were it to continue at that price a little longer, farmers would not continue to cultivate, and that therefore the decreased quantity grown must increase its price.

Is it a fact, within your knowledge, that there has been a great deal of emigration from the East Riding of Yorkshire?—A great deal, and a great deal from Melbourn. Where I reside, the parish is Thornton.

Will you take any farm, within your own knowledge, in the East Riding of Yorkshire, and state whether, provided those farms had not been subdivided, the same number of labourers would be employed upon those farms now, as there were when prices were more remunerating?—Certainly not.

From what class has the emigration principally taken place?—I think that emigration has taken place principally from the direct labouring class in point of number; many of the farmers have emigrated, but the numbers are the labourers.

If emigration takes place to a manufacturing district, the whole family do not emigrate, do they?—No; several of the younger people get into manufacturing districts, but the father and mother and the younger children remain in the country.

Then in fact an increasing number of children come into the account of the population returns?—Yes.

Within the last fifteen years there has been a greatly improved cultivation of the Wolds, which you say constitute one-third part of the East Riding in consequence of the introduction of bow husbandry?—Yes.

Would that have very much increased the labouring class in the East Riding?—The Wolds are better cultivated than they were; there has been an increased demand for labour on the Wolds.

Has there been any increase of the allotment system in the East Riding?—Where gentlemen reside upon their estates the allotment system has been considerably increased.

Would not that rather tend to increase the number of labourers?—I do not exactly see that; it renders their situation more comfortable.

You have stated that the poor soils in a great portion of the East Riding had nearly ceased to be cultivated, are there any farms untenanted?—Yes.

What is the state of the buildings upon those farms?—They are going to decay.

Are there any poor rates paid?—Yes.

From what source?—The landlord generally pays the poor rates, even though he does not receive the rents.

What is the course of cropping generally in Howdenshire?—That land has been under cultivation time immemorial, but they are not good farmers, they know very little of sowing grass seeds, and the drill is not much in use; two crops and three crops to a fallow; upon the better soils three crops; fallow and wheat and oats sometimes, which is not good husbandry, or fallow, wheat, beans, and oats, which is rather better husbandry.

You spoke of there being much less grass land in the East Riding than formerly; when was that grass land ploughed up?—That grass land has been going progressively until the last few years, when I think the landlords have been more tenacious of the little remains of grass land.

Then you consider the grass land to have been very improvidently ploughed up?—Yes.

Do not you think that in some measure accounts

for the distress of the farmers in that district from their want of knowledge in the cultivation of the soil and from their ploughing up land which ought not to have been ploughed up?—I think that farming is better understood at this time than it has been at any former period; but it is extremely difficult for men who are deficient in capital to avail themselves of an increase of knowledge, because better farming requires increased capital; they know how to farm now better than they are able to do.

Was that part of the country ever tenanted by men of large capital?—Yes, they were a very opulent body.

Are you speaking of Holderness or Howdenshire?—Howdenshire.

Holderness is a better district, and there are better farmers there?—They are better farmers there, and they were a still more opulent body.

Are they now?—Yes, I think they are now, at least they are a less distressed body.

Do you know any district in England where there is better cultivation carried on than in the East Riding?—Yes, along the banks of the Till, in Northumberland, the cultivation is very decidedly better.

Do you know any district south of the East Riding of Yorkshire that is better cultivated?—No, I think we are equal to other parts.

You have stated that the farmers in Howdenshire and Holderness are nearly insolvent?—Taking them as a body, I believe them to be insolvent.

And that the distress of the farmers has been considerable?—Yes.

Will you state what you consider would be the means of relieving the farmer at the present time?—I think that we have obtained some little relief from the change in the poor law system; I think that is working very favourably with us. We should have obtained more relief, and greatest relief by the alteration of the highway laws; the highway laws are very oppressive in the East Riding of Yorkshire, particularly in this very district of Holderness, and what I have called Howdenshire, explaining by that that I meant that class of country which is exactly similar, and which adjoins it.

Is there nothing beyond the highway rate and the poor law that you would look to for relief?—Latterly we have looked principally for relief by some change in the currency.

That you think would be the means of relieving the farmer considerably?—If money was of less value wheat would be of more value.

Have you any other remedy to point out to the committee that would be of use?—I am not aware of anything else.

A change of the currency would be in your opinion the principal means of remedying the distress?—I fancy that is the great means.

Do you think that the graziers have suffered from the low price of tallow of late years?—I have not stated that the grazier has been an extensive sufferer.

Has the price of tallow of late years been remunerating to the tallow growers?—It is but a small article; I am quite aware that it must make a difference, but it is not very considerable in the value of a beast.

Have you been at all conversant with the killing of cattle?—I cannot say that I have; I think I am a pretty good judge of the beast as we sell it, but not of the tallow that the beast contains.

Have the subdivision of farms of which you have spoken been carried to any great extent?—It has, to a considerable extent.

What was the size of the farms generally speaking

before they were subdivided?—I think I could average them at about 300*l.* a-year, about 300 acres. I am speaking of the average of the East Riding.

What has been the division of those farms?—Those farms are not now near so large; I think the number of farms has been increased by one-third in the lower part of the East Riding.

Has any alteration in the rent taken place in consequence of the subdivision, or have the farms been let at about the same rent?—The rents have been reduced.

What has been the case as to the buildings, has there been any difficulty in erecting new buildings upon the subdivision?—The buildings have been increased consequent upon the subdivision.

At whose expense has that been done?—The landlord's.

Then that has formed another heavy pressure upon the landlords!—Just so.

You have stated that a considerable amount of land has gone out of cultivation in Howdenshire and Holderness, will you describe, particularly where those districts of land are, the parishes for example?—Land of that description has gone out of cultivation in Melbourne, and I could name many other places, but I do not wish to expose particular estates.

Has the land that has gone out of cultivation consisted of whole farms or portions of farms?—Of whole farms, with the exception of small parts of those farms.

Has the land that has so gone out of cultivation been ever since in a state of waste?—Yes.

**POLISH AGRICULTURE.**—WARSAW, April 29.—The Council of Administration of the kingdom of Poland, considering that, in consequence of the fertility of last year, and the want of a foreign market for corn, the price has fallen so low that it does not repay the expense of production, has at the instance of the Director General of the Committee of Finance, and in order to relieve agriculture, issued an ordinance, that the Polish Bank shall advance money to the inhabitants of the country on wheat and rye, to be deposited in the magazines under its lock, and in other suitable repositories, which must be well secured and insured against fire. Such advances may be made to the amount of 3,000,000 florins; but should this sum not prove sufficient, the bank is authorized to apply to have it increased. The time for which the advances are made is fixed at three months, but the bank may prolong the term if it thinks it necessary, and circumstances allow.—*Dutch paper.*

A trial took place in the Court of Exchequer, during the last term, of some interest to the breeders of sheep in this neighbourhood. Mr. Rogers, a sheep-dealer, purchased at Weyhill Fair, about 2000 sheep of different farmers, paying for them in cheques, which were dishonoured. Mr. C. Blake, under the advice of his solicitor, followed those sold by him, and found them on Rogers's farm, in Hertfordshire, in the possession of the sheriff, under an execution at the suit of the father of Rogers. Mr. Blake gave the sheriff, who had sold them, notice that they were his property, and that he should bring an action against him unless the produce was paid to him. The sheriff refused, and an action was brought by Mr. Blake, who proved that Rogers had overdrawn his banker's account upwards of 600*l.*; that he had bought many other sheep; that some persons had followed theirs, and seized them; and that some of them were put into a hay-loft in Smithfield.—The jury gave a verdict in favour of Mr. Blake for 118*l.*, the amount at which he sold his sheep, being 43*l.* more than they produced at the sheriff's sale.

## CULTIVATION OF TURNIPS.

TO THE EDITOR OF THE BELFAST NEWS-LETTER.

SIR,—As the season has now arrived for sowing turnips, a species of crop whose cultivation has been given up by many farmers as unprofitable, chiefly from the proper mode of cultivating that valuable root being imperfectly known, I beg permission through your valuable journal to offer a few directions on the subject, hoping that they may not prove uninteresting to some.

The soils best suited to the turnip are those of the lighter class. The proper place in the rotation for the turnip, is both to precede and succeed a white crop, and the land should be ploughed by a deep furrow in autumn, after the corn crop has been removed. Then in spring, when the grain crops are sown, and the potatoes planted, the farther preparation of the turnip land should be resumed. The first ploughing should be across, and the ground left to dry for a few days, then harrowed by repeated double turns of the harrow in various directions, for the purpose of pulverizing the ground, and disengaging the weeds; and the roller should be also employed where necessary. After this process, all the weeds which are dragged to the surface, should be carefully gathered by the hand, and carried off the ground. These should be mixed with quick lime, and formed into a compost, which is preferable to burning them on the ground. At the same time, all the land-fast and loose stones should be removed. Land in general requires at least other two ploughings, traversing each other, before it can arrive at a proper pliable state to be formed into drills. The land must then be formed into single bout drills. They are not so eye-sweet as when formed by a double bout, but they answer the purpose equally as well, as they have shortly to be levelled by the subsequent operations, and they require only the one-half labour. The width of these drills may be 27 inches from centre to centre. This width is necessary to allow the intervals to be tilled by the horse-hoe, and to admit of a sufficient circulation of air between the rows. The drills being formed, the dung is to be led forward, and the horse directed along the interval of a drill, each wheel of the cart will bring in the interval adjoining, as the cart moves along. The dung is to be pulled out into little heaps, sufficient to manure three drills. Four persons should be attending the carts, one going before and dividing the dung lying in the centre drill between it and each of the adjoining ones, while the other three spread the dung regularly along the hollows. The dung being spread, should be immediately covered by the plough passing down the centre of each drill. As liberal a quantity of manure as can be afforded should always be applied to the turnip crop—12 or 14 tons of farm-yard dung to the Cunningham acre is a pretty fair allowance. Street dung, sea-weed, and ashes, are all well adapted to the culture of turnips; their fertilizing effects may, perhaps, not be so permanent as farm-yard dung, where there is so much excrementitious matter, but very abundant crops are often produced by their instrumentality. Bone manure has an almost magic effect in raising turnips. In Berwickshire, I have often witnessed the experiment tried with farm-yard and bone manure, every four alternate rows throughout the field, applying 14 tons farm-yard dung, and only 32 bushels bone manure, to the acre; and I never witnessed the farm-yard dung produce such an abundant crop, either in tops or bulbs;

but I must add, the succeeding crop of barley was in general more productive after the farm-yard manure. Bone-dust may be applied in two ways, either sown with the hand in the hollow of the drills, and covered the same as dung, or sown at the same time with the turnip seeds, by means of an apparatus attached for the purpose to the turnip sowing machine. When it is to be sown by the hand, the drills should not be formed so deep as for dung, but they require to be covered the same depth as when the latter is applied. The quantity of seeds sown to the Cunningham acre may be 2½ or 3lbs. The several operations of forming the drills, spreading the dung, covering it by the plough, and sowing the seeds, should be carried on in close succession, and executed with the greatest possible speed. The dung should be immediately covered, to prevent withering and loss by evaporation; and the seeds should be sown while the earth is newly turned up and moist, which promotes a more vigorous and early vegetation of the seeds. From the middle of May to the latter end of June is the period of sowing. When sown earlier they are apt to run to seed before winter, by which the root is in a great measure exhausted of its nutritive juices, and if sown later, the turnips seldom attain a proper size. The Swedish should be the first sown, for they are a later ripening plant, and require a larger quantity of manure, but they are by far the most nutritious of their species. The next in the order of sowing is the Yellow Aberdeen—then Dabs-hybrid—and lastly, the Globe, Norfolk, and Tankard turnips—of which the most valued is the White Globe. Of the three last mentioned kinds, there are both white, green, and red—the white are more palatable to animals, and more highly esteemed as food. The subsequent operations, with regard to the culture of the turnip, are the following:—As soon as the plants have assumed the rough leaf, that is generally when they are about 2½ inches in height, the first horse hoeing should be performed, which is done by a small one-horse plough going up and down the interval of each drill, and there cutting off a small slice of earth as close as they can go without injuring the plants. Immediately succeeding this operation, the hand-hoers remove the weeds and superfluous plants into the intervals, where they soon die. The plants to be preserved are left standing singly in the rows at a distance from each other of from 9 to 12 inches. The Swedish should be left closer than any of the other kinds—the bulb seldom attains the same size. Swedish 9 inches—Yellow Aberdeen 10—Dabs-hybrid 11—and all the other kinds 12, generally speaking, but the width may be either more or less, according to the high or low condition of the soil.

In the course of twelve or fourteen days after this process, the horse-hoe generally passes a second time along the intervals, cutting up all the weeds that may be again springing up, immediately succeeded by the hand-hoers, who carefully hoe round about the plant, cutting up all the weeds to which the plough had not access, and singling any of the plants that had been omitted in the first hoeing. It is often necessary to give them another horse-hoeing; but where this cannot be conveniently accomplished, the process may be performed by the hand-hoers. In 12 or 14 days after the last hoeing, if the land be naturally wet, the double mould-board plough should be made to pass along the intervals once, or the single mould-board twice, to give free egress to the sur-

face water, and keep the turnips dry during wet weather, in autumn or winter. This finishes the culture of the turnip, which will grow rapidly without further care. If the foregoing directions be punctually attended to there is little danger of realizing a good crop, and if judiciously consumed will amply remunerate the grower.—May 16.

**DRAW MOSS.**—Some pastures are more grassy than others, and it has been remarked in the lower parts of Dumfries-shire that the stocks have thriven best where heather abounds, and is burnt, as arable land is ploughed, upon a system of rotation. The nutritive properties of draw moss have long been known to breeders and others, and the time has been when Airs Moss was as celebrated for wintering hogs as it was in the days of the Covenanters. The prices charged originally were a half under the expense of other grounds; but they have since risen, and although the locality is still a favourite one, it is no longer resorted to on the score of economy. But to some it may be necessary to explain that draw moss is a species of ground favourable to the growth of a plant, the flower of which resembles cotton, and which Graham in his beautiful poem "the Sabbath" calls the "canna of the wild." In January and February the sheep apply their teeth to this plant, pull it slowly up by the root, and feed on the lower part to the extent of three or four inches. And the nourishment they extract from it is so considerable that if draw moss districts were more common, and at all times accessible, they would serve the flocks in good stead during the bleakest periods of the year. In Dumfries-shire the *canna* is often found on levels at one time usurped by the sea, while in many parts of Galloway it oftener appears on the tops of hills—a circumstance which operated much against the flocks during the present season, from the impossibility of locating them in such dangerous spots during the prevalence of storm and drift.—*Dumfries Courier*.

**A HOG MARKET.**—The hogs were most ingeniously kept together, and prevented from blending with passing herds by being arranged in a circle, of which their tails formed the circumference, while their heads were ranged together, gazing upon a single fettered hog, probably the most unruly of the herd, who lay most uncomfortably, as an example, in the centre. They gazed at their persecuted brother with more pitying sympathy in their countenances than I believed the swinish physiognomy to be susceptible of; while ever and anon the half-savage swine-herds, rudely dressed in garments of skin, notified by energetic blows from their long poles to any delinquent subject who was disposed to back out, that the experiment might not be innocent. Each swinish circle was surrounded by its group of cheapeners, malevolent and slanderous individuals, who were not even superior to the calumny of a pig; pronouncing, in their anxiety to drive a bargain injurious to the swine-herd and advantageous to themselves, a most apoplectic-looking pig to be poor and starveling. At length a round-bellied citizen having concluded a bargain, which he pronounced most onerous, proceeded to take possession of the animal which he had maligned. The swineherd separated the purchased animal from his brethren very ingeniously, by taking its two hind-legs in his hand, then turning his back upon it and walking off as with a wheelbarrow—the hog being obliged to move its fore-legs out of respect for its nose. I had often seen a hog contended with, but never mastered before. The Spaniards, indeed, have a wonderful sagacity about animals, which they manage with infinite address.—*Spain Revisited*.

Oak bark is selling in Hereford at from 5*l* to 5*l* 10*s* per ton. The season is peculiarly backward, being at least a month later than usual.

## CUSTOMS BETWEEN LANDLORD & TENANT, AND THE INCOMING AND OUTGOING TENANT.

(FROM KENNEDY AND GRAINGER'S CUSTOMS OF COUNTIES.)

### BUCKINGHAMSHIRE.

A tenant in this county is, generally speaking, scarcely under any restriction; he is allowed to carry hay and straw off the farm, and to crop the land as he pleases: in some cases, indeed, he is restricted to two crops and a fallow, but this is of rare occurrence, the system most frequently pursued being of a contrary description.

An outgoing tenant can sow the spring corn until Lady-day, it being entirely at his option to allow the incomer to enter upon the land, in order to plough and sow it himself. The former is entitled to be paid for his seeds on the ground, for the carting of manure, and for any ploughing done by him, of which his successor reaps the whole of the benefit. If the incomer does not agree to the valuation of the wheat and spring corn, sown before Lady-day, he having the option of either taking it or not, the outgoing may cut and take the crop himself, on paying rent and taxes for the land it stands upon until the following Michaelmas, and convey it away wherever he pleases. This custom frequently compels an incoming tenant, in his own defence, as it were, to purchase a crop for the sake of the dung; and thus a tenant entering upon such a farm has to pay a large sum of money. He is not however bound by custom to pay for more than the seeds, the spring and winter ploughings solely for his benefit, and any turnip land fed off, which he pays for as fallow: nor would he, probably, do more than this, if he could put up with the inconvenience of losing the straw, he having left a farm under the same custom; otherwise he must risk the value of his predecessor's crop, and expend great part of his money at the outset of his undertaking. The incoming tenant, however, has the benefit of all the dung that is left in the yards, or upon the farm, free of expense.

MODE OF CULTIVATION, IMPLEMENTS, &c.—Turnip husbandry is chiefly carried on upon the hills, and is confined to a small portion of the country. Chalk is very commonly laid out during the winter as a manure for the turnips, which, from the effects of the weather, runs like lime, and is found, when properly managed, to last as a manure for many years.

The rotation of crops upon the hills is—first, turnips; second, barley; third, seeds; fourth, wheat; and often, fifth, oats; but, on the low grounds, wheat and beans are the chief productions. This mode of cultivation is, in some places, closely followed for a long time, without making a fallow, and on ground so managed oats are seldom grown, they being found to impoverish the land more than a crop of wheat.

There is but little draining practised in this county, though some parts would be greatly improved by it, and what is done is chiefly at the expense of the landlords.

Wheat and other kinds of grain are here usually sown by hand, with the exception of beans, which are set by the dibble; this, however, is rather a tedious process, the man employed, dibbling with one hand, and setting with the other, as if he was planting cabbages: this method is, it seems, adopted on account of children being careless in planting unless they are strictly watched. Neither the drill nor the threshing machine are much used in this county. The outbuildings, which are generally of brick, and thatched, are kept in repair by the landlords.

## TRICKS PRACTISED FOR LIBERATING BONDED CORN.

Mr. Sturge, of Birmingham and Gloucester, gave the following statement before the Committee of the House of Commons on the State of Agriculture:—

You have talked of fraud, or of something of that nature, operating on the averages; will you state whether you are acquainted with any instances of that sort?—Personally, I can only state one, though I had no interest in it; yet I think it would be harsh to term it a fraud; it has been (I have understood from others) practised in the case of oats, and I think it has also in the articles of beans and peas. The instance to which I allude was in wheat. Some years ago we received an order from a very respectable house at a distance to purchase some English wheat, in June or July; it was, I think, stated to be for a friend or friends of the parties who wrote, and I have no doubt this was the case. The corn was afterwards resold at a loss, the weather becoming fine shortly after, and the new wheat came upon the market rapidly; but I believe if the harvest had been delayed only a fortnight, the speculation might have succeeded. I did not know that there was any unusual object in having the corn bought till months after, when I had reason to conclude it was intended to *run up the averages to liberate Bonded Wheat*, and though it did not succeed, I think the Committee will see that it will be impossible to guard against such an operation under the present system of Corn Laws, when neither the buyer nor seller knows the object of it. If it is carried on at the time of the year when the markets are shortly supplied, the tendency is to run up the price, it may be even 10s. or 12s. a quarter, and when they got up to that, the re-sale would have secured to parties interested a profit, at the same time liberating any *bonded* corn they might hold at a lower duty. I mention it as an instance in which the present corn laws afford a temptation that to some parties under certain circumstances is almost irresistible.

CHAIRMAN.—In what market did this take place?—Our means of buying were only in some of the midland districts; perhaps we bought by agents in three or four counties, say in Warwickshire, Worcestershire, Shropshire, and Staffordshire.

In all the markets with which you were engaged?—Where we could buy wheat within certain limits as to time.

Would it not be necessary that a similar operation should take place in all the different corn markets in England to effect a rise in the price?—Yes, in several districts it would; it is only under particular circumstances that such an operation can be successfully acted upon.

Mr. CAYLEY.—They were speculating for a reduction of the high duty?—Yes.

Were they speculating for the lowest fall in the duty?—The lowest they could obtain. Nothing ever passed between us on the subject, only from accidentally ascertaining afterwards who the principals were, led me to that conclusion as to their object.

There might be an opportunity for that state of things without repealing the corn laws?—Yes; and without releasing the wheat at the lowest duty; a difference between 7s. or 8s. and 90s. would be a very great temptation.

THE TIMBER DUTIES.

(FROM THE HERALD.)

A great and increased interest has been excited during the past week or ten days, amongst the leading members of the timber trade of the Port of London, and the different outports, particularly that portion who are deeply engaged in the Canadian wood trade, by the more active demonstrations that have been evinced in the Board of Trade to carry out their plan for levying the duties on deals by their cubical contents, with a graduated scale of duties varying with every two feet in length. Some months ago we stated that many practical men had confirmed the surveying officers of the Customs as to the impracticability of levying the duties on deals by their cubical contents, and we believe that not one of our dock-yards, particularly those of the outports, would afford space for the necessary assorting of mixed cargoes of timber. The same objections still prevail; but Mr. Hume, who has some scheme in his figurative fancy, of having barges built with rooms arranged to take in separately the graduated lengths of deals, and then to ascertain their cubical contents by gauging the contents of the hold of the barge, after the manner of gauging wines, &c., has had several of his clerks down at the Commercial and East Country Docks during the past week, measuring the different lengths of deals, it is supposed with a view to the establishment of his notable principles, and the support of the theories of the patriotic President of the Board of Trade. The effect of this mode of taking the duties, to say nothing of the hindrance of business, would be to give a *complete monopoly* in the deal trade to Sweden and Norway only, who never will take anything in proportion from us in return; and in the same ratio it will drive our lumber ships out of employment. It will deprive Prussian and Russian timber of the advantage of this market; and we understand the Prussian Minister has strongly remonstrated against the unfairness of the principle. Russia does not care about it, as she can consume her own timber, and has rather cavalierly declined the intended clap-trap overtures of the President of the Board of Trade. We now subjoin the following statement, because it places the question in a clear point of view, and will be interesting to a numerous portion of our commercial and colonial readers:—

“The Committee of the House of Commons on the timber duties have recommended a reduction of duty on foreign timber not exceeding 15s. per load. This is bad enough for the colonist and British ship owner; but, it is feared, that, in endeavouring to resist that alteration, we are too much losing sight of a more injurious change still, which is recommended by the same Committee—namely, an alteration in the scale of sizes for the duty on deals, nearly approaching to a system of taking the duty by their cubical contents.

“Of late years it has been the Policy of our Government to keep open all sources of supply in the article of deals; and it has worked well, in giving the consumer the choice of all kinds and sizes of deals. These sources may be classed into three—namely, Norway and Sweden, Prussia and Russia, and the Colonies. The first source possessing chiefly

the shorter and smaller timber, and having the advantage over the second of a shorter voyage, and, therefore, lower freights, it is evident that a duty per hundred of deals, approaching nearly to the timber duty on their cubical contents, would give to Norway and Sweden the monopoly of the supply of deals, except in those few cases when very long and broad deals were required for particular purposes. The existing system of a wide scale of sizes for duty has prevented this monopoly, and has enabled Prussia and Russia and the Colonies to compete fairly with Norway and Sweden, to the manifest advantage of the consumer. Those who argue for the proposed change must abandon the favourite maxim—“Go to the nearest and cheapest market;” for, with our enormous consumption, to cut off Prussia and Russia from the supply, will be to raise the near and cheap market to the level of the distant and dearer one.

Again, it is surely the policy of the Government to keep up the competition of supply from the Colonies. The foreign sources may be cut off, as they have been before; to say nothing of the interest which the British and Irish ship-owner has in the Colonial trade.

“One hundred and twenty foreign deals of 12 + 3 + 9, contain five loads and 20 feet, and pay at present a duty of 19l.

“Foreign timber pays 55s. per load; and even if the duty on timber were not altered, and the proposed plan of taking the duty on deals adopted, five loads and 20 feet at 55s. would be 14l. 17s.

“How fatal, then, to the deal trade of the Colonies, of Prussia, and Russia, would be the double alteration of a reduction on timber, and an approach to cubical contents in taking the duty on deals! The number of kinds of deals, the variety of lengths, breadths, and thicknesses, and the calculations necessary to understand the operation of any scale of duties, are such, that it is not too much to say that very few of the Members of the Timber Duty Committee knew what they were doing when they recommended that the duty on deals should be taken by nearly their cubical contents.

“120 Foreign deals of 12 + 3 + 9 is			
5 loads and 20 feet, which, at.....	55s is	£14 17	} Present duty, 2l
	50s ..	13 10	
	45s ..	12 3	
	40s ..	10 16	

“120 Colonial ditto ditto ditto 10s — 2 14 } Present duty, 2l

“Therefore, at 55s. and 10s., the present duties on timber, and a new scale of sizes approaching to cubical contents, the difference in favour of foreign deals, and against colonial, would be 4l. 17s. per 120 pieces.

“At 50s. and 10s. ....	£6 4
45s....10s. ....	7 11
40s....10s. as proposed.	8 18

“As between Norway and Sweden on the one hand, and Prussia and Russia on the other, the shorter and narrower timber, and the lower freights of the former, would give them an advantage of 4l to 5l per 120 pieces, but, as before said, without the gain to England of a fraction of this advantage.

“Those ports of the United Kingdom which have limited dock-room, and were deals are often sold afloat or sent inland without being landed, have cause to condemn the proposed change; it will oblige the importers at all these to land and bond their deals. The restriction on trade, and delay, expense, and inconvenience attending it, are large disadvantages in the plan. In London, Hull, Gloucester, &c., the expense of landing would amount to a heavy charge on the value of the deals.

“ Nothing more seems necessary to recommend this subject to the earnest and immediate attention of all who are interested in it. In Ireland the duties on deals are different from those in England; but the Irish merchant and ship-owner, who are losing by the employment of steam-boats between England and Ireland the importation from abroad of all valuable goods, are, nevertheless, deeply interested; and it becomes them, through their Representatives, and by remonstrances to the Board of Trade, to bestir themselves, lest their rising efforts should now be crushed; and, finally, it is the part of the consumer, the timber merchant, the Colonial, Russian, and Prussian importer, and the British ship-owner, to strain every nerve to prevent so fatal a change.

A SPORTING CHARACTER.—The late celebrated John Beardsworth, of Birmingham, commenced the world as a driver (not an owner) of a hackney coach. A story, and a true one is told of him, to the effect that, on one occasion there being a grand ball in the town, Beardsworth had to drive an heiress to it. The lady was young and beautiful, and Jack was smitten! He went home, dressed, paid for admission to the ball, danced a great part of the night with his fair, (*fare!*) and gallantly handed her out to the coach, mounted the box and drove her to her home! He managed to run away with her soon after, and her money was the foundation of his future fortune. Beardsworth became proprietor of the largest repository in the British empire for the sale of horses and carriages. His house (built on the same ground with the repository) was all that money could make it—it was indeed a curiosity. The hall was lined with splendid mirrors—the carpets were of the richest Turkey—every chair was of a different pattern, and each as sumptuous as imagination could conceive. The chimney pieces were exquisite, and the tables of the richest and rarest woods—one centre table cost 1,500*l.*, and was made of every wood indigenous to America. It was part of his business to keep up a famous stock of wine, for truth to say, what bargains were unfinished in the stable or in the repository were finished with *spirit*, over a bottle of wine in the dining room. He used to say that his wine sold off all his hack horses and craziest carriages, and the best of the joke was, that people who had filled themselves at his table with the fat of the land, and the best vintages of France, Spain, and Italy, would scarcely admit, even to themselves, that “honest Jack Beardsworth” had taken them in. When Beardsworth’s racer, Birmingham won the Doncaster St. Leger, he could not have been worth less than 250,000*l.* It soon melted away on the turf. The whole story of the race is curious. The famous Jack Mytton, of Halstead, lost a great part of his estate by dealings with Beardsworth, and from 1826 to 1830, all Beardsworth’s racers were entered in Mytton’s name. One of these was Filha da Puta, the sire of a sickly colt which was foaled at Beardsworth’s. Orders were given to kill the colt, it was so weakly, but Mrs Beardsworth having seen it, said—“No: give it to me—I shall try and nurse it.” Accordingly it was given to her, and she had it carefully fed on bread and milk, &c., until it became quite strong and handsome. Lord Grosvenor saw the colt at a year old, and offered to buy it. Beardsworth said—“No; Mary owns Birmingham, and she intends running him for the St. Leger.” “And if he runs,” said Lord Grosvenor, “he certainly will win.” The animal became so tame that he used to follow Mrs. Beardsworth all round the dining-room

table, and allow the children to play with him. In fact the future winner of the St. Leger was as much domesticated as a dog or a kitten. Birmingham was duly entered for the Doncaster St. Leger, and as duly were attempts made to come at the blind side of Conolly, the jockey who was to ride him. Conolly informed Beardsworth of the offers made to him, and, acting under his advice, carefully pocketed every bribe. Conolly made extensive promises to all parties that Birmingham should lose. A man named Gregg took care that the horse should not be meddled with. To such an extent did this caution go, that the water for the horse was actually fetched from a distance of ten miles! Gregg actually lay in the stable, cheek by jowl with the horse, for ten days before the race. When the day came on, it rained cats and dogs, and Birmingham won by strength. Beardsworth had freely taken 40 *l.*, and cleared 40,000*l.* by the race. He presented Conolly, the rider, with 1,500*l.* His daughter and wife gave 500*l.* more, so that the rider got 2,000*l.* by his honesty. He was induced, by his success, to keep a racing stud of his own. He lost an immensity of money by it. Beardsworth was much attached to his wife. He always called her my “right hand man.” She kept all the accounts, made all money payments, and was, in fact, complete major-domo of his immense establishment. No man in England was better acquainted with the racing calendar! She died about two years since, and her death was the worst thing next to his own, that could have happened to Beardsworth. All his concerns were at sixes and sevens after her death. Beardsworth farmed the post-horse duties for the midland counties of England; and his wife, knowing the toll-receivers and inn-keepers cheated them, took a tour to every station, dressed as an officer in the army, discovered a thousand instances of fraud, and thus added at least, 10,000*l.* to the income of her husband.—Beardsworth married one of his daughters in 1830, to a cavalry officer, whose father was a wealthy sugar baker in Liverpool. His epistle to that worthy was laconic, but much to the point. It runs thus:—“Sir,—Your son loves my eldest daughter, and she loves him. They are determined to marry. You sell sugar and I sell horses. I am content to put down shilling for shilling, pound for pound, hundred for hundred, and thousand for thousand with you, to make a provision for the young couple. Your’s, JOHN BEARDSWORTH.” The sugar-baker refused his consent, so the match took place without. The newly married couple drove from church in a splendid carriage, with four bloods, a present from Mr. Beardsworth. In the pocket of the carriage was loosely thrown a draft from Beardsworth on his banker for 50,000*l.* This was his off-hand way of doing things. At Beardsworth’s death, he owed Government a balance of 35,000*l.*, and an execution was levied on the property; but it paid 20*s.* in the pound and over; so that after all there was some pecuniary provision made for his family, but not much.

ENORMOUS HIGHLAND KYLOE.—A very fine fat West Highland Kylee, which when alive was supposed to be about 130 stones in weight, was slaughtered here on Tuesday last, by Mr. Robert Dryden, flesher. The weight of the carcass, after it was slaughtered and dressed, was 70 stones 3*lb.*, and the offals was 34 stones 4*lb.* It contained upwards of 12 stones of tallow, and the head, feet, and tongue, weighed 5 stones 3*lb.* This fine animal was fed by Mr. Ephraim Selby, of Minto, and was exhibited yesterday week in this market, when it was greatly admired by many eminent judges for its symmetry and beauty.—*Kelso Chronicle.*

## ON AN ECONOMICAL MODE OF APPLYING BONE-DUST AS MANURE FOR TURNIPS.

The immense quantity of bone-dust which is now annually used as a manure for raising turnips, and enriching fallow land, may reasonably excite an apprehension that all the bones of animals which are killed for the use of man, and which are allowed to die a natural death, will be inadequate to supply the demand for them as a manure. Bones of animals being applied to many other purposes besides that of manure, it is extremely probable that, were they as liberally used in agriculture on the continent of Europe as they are in this kingdom, and were their use still farther increased in this country, the demand would greatly exceed the supply; for, under present circumstances, a great proportion of the bones which are bruised into dust in this country, besides bone-dust itself, is imported from abroad; and, even with this great foreign supply, we find the price of bone-dust has risen in value in the market from 2s. 6d. to 3s. 6d. a bushel. An apprehension, therefore, of a scarcity of it in future appears to be too well founded.

In order to advert, in some degree, the evils arising to agriculture from a scarcity of so valuable a manure as bone-dust, and to keep its price within the bounds of moderation, I have endeavoured to use it in an economical method for the last two years, by which half the quantity usually employed is quite sufficient to insure a heavy crop of turnips.

The quantity of bone-dust usually applied is two quarters per imperial acre: I use only one quarter per acre; but I always mix the bones with coal-ashes. These ashes may be procured in towns and villages, at a price not exceeding 5s. per ton; and the quantity mixed with the bones depends in a great measure on the quantity of ashes that can be obtained;—the more of course the better, but it should never be less than one or two quarters per acre.

The ashes are put in a dry place, under cover, such as a cart-shed, or out-house, and riddled as small as the bone-dust itself; that which passes through the riddle ought only to be mixed with the bones. The bones should be very carefully and equally mixed through the mass, which will be best effected by frequent turnings with the shovel. The turnings also assist in drying the ashes, which, if they are not, they will not pass easily through the hopper of the sowing-machine. The ashes should be collected as early in the season as possible, that they may get thoroughly dried. After the bones are mixed with the ashes, the mass ferments, and evolves a considerable degree of heat, which subsiding, assists the drying of the ashes considerably. To expedite the drying of the ashes, when they cannot be procured early enough in the season, I would recommend their being strewed with a dusting of hot lime, while the mass is turning over, in the same manner that pickled wheat is dried with lime to render it fit for sowing. I never tried this expedient, because I always procured an early supply of ashes; but I feel confident that it will answer the purpose. The compost is sown with the usual machine.

Turnips raised with this compost of bone-dust and coal-ashes, in the quantity alluded to, I have sold for £7 per acre, to be eaten off with sheep; and they always possessed the same character of a close crop, firm root, and hardness to resist the rigors of winter, that turnips raised with the bone-dust alone evince. I believe it is the bone-dust which alone secures the crop of turnips, whatever nourishment the ashes may impart to the crop at the future stages of growth.

Lest this be doubted, let the ashes be used alone, and a woeful falling off of the crop will inevitably ensue. Perhaps peat or vegetable ashes of any kind would be equally beneficial to mix with bone-dust as those of coal. It is known that any quantity of bone-dust above two quarters per acre, does not produce a corresponding increase in the bulk of the crop of turnips, though no satisfactory experiments have yet been instituted to ascertain how small a quantity of bone-dust alone is sufficient to procure a crop; but, I trust I have discovered how small a quantity of it may be used with a commodity which is in the reach of every person, so as to secure a crop,—a result which may be considered as one step towards a right understanding of the properties of so valuable a manure.

It may not be irrelevant to mention here a substance which has been described by Professor De-candolle, of Geneva, as a consideration of its properties may serve to explain the active energies of bone-dust as a manure.

Of all the different ingredients of which manures are composed, carbon is supposed to be that which holds the first rank as a food of plants; but it is only in a state to be the food of plants after it has united with the carbonic acid of the air. It is this compound, on being dissolved, which is taken up by plants as food. This substance was called *umine*, on account of its being first found in a diseased part of the elm; but M. Sprengel gave it the more general term of *humine*, because he found it to exist in soils.

Humine is a substance not unlike carbon, for which it has hitherto been mistaken. It is very soluble in spirits of wine, concentrated sulphuric acid, ammonia, and by heat in acetic acid; but it is insoluble in water, and water throws it down in all its solutions. It combines with all the salifiable bases, and forms the *humic acid*; but it has no acid taste, does not reddens vegetable blues and like the gallic acid, it contains only carbon and water, without excess of oxygen. There is a strong analogy between humine and other nutritive substances, such as gum or fecula. It forms a humate with an alkali, which is very soluble in water.

All substances which contain carbon are dissolved in the water of vegetation, through the means of humine; and the dissolved mass is taken up by plants as food. Humine in combination with lime, ammonia, or potash, becomes soluble in soils or dung, and thus becomes the food of plants.

Keeping in view these properties of humine, I think the action of bone-dust may be explained: and important conclusions may be drawn regarding the state in which putrescent manures should be applied to the soil. It is well known that bones ground into dust soon undergo decomposition in the soil. The decomposition disengages the phosphoric acid, and the lime and animal carbon is left to be acted on by the air; and which, being converted into humine, readily forms a soluble mass with the ammonia, lime, and acid of the bones. This dissolved mass is taken up by the water of vegetation, and becomes the food of plants. Moreover, the frequent application of putrescent manures to the soil, must accumulate a quantity of carbon in it, which will there remain in an inert state, till it is put into a fit state to be taken up as food by plants. Lime, bone-dust, or kelp, will render the mass of inert carbon active by the formation of soluble humine. The decomposition of vegetable substances is the best means of supplying the carbon which is to be converted into humine. Hence, then, we can explain how a fine black rich mould may become inert, or *dead*, as it is termed, till

it is limed; and also how it is that bone-dust raises heavy crops of turnips on such soils; hence, also, how it is that vegetable soils of an inferior nature, such as heathy, turfy soils, are improved by liming; hence we now see that the practice of applying the putrescent manures in a highly decomposed state to the land, is the state in which it contains the greatest quantity of humine in the same bulk of manure; and also that fermented dung being kept and applied to the soil in a *sappy state*, is the very best possible one to preserve the humine from waste during the process of preparing the dung for the land.

I sincerely wish that some able chemist will take up this very interesting and important subject, regarding the chemical action of putrescent manures in general, and of bone-dust in particular. By the mutual co-operation of the intelligent farmer and the acute chemist, results may be obtained which might greatly reduce the very heavy charge of maintaining the fertility of the soil, but without that fertility the soil would soon become a *caput mortuum*.

Before concluding, allow me to suggest to chemists the investigation of the nature of the change which is produced in the soil by the decomposition of animal bones, and what remarkable combination the substance of the bones enter into, to produce so active a manure as bone-dust undoubtedly is.

To assist in this investigation, I intend to make some experiments this summer with bone-dust in raising different kinds of turnips, and I shall carefully procure a little of the soil for chemical analysis.

G. B.

**BIRTH-DAY OF C. G. S. MENTEATH, ESQ.**—A number of the tenants upon the estate of Closeburn, met at Brownhill Inn, on Monday, the 16th May, to celebrate the birth-day of their worthy landlord, C. G. S. Menteth, Esq. Mr. Fisher had provided for them an excellent and substantial dinner, which along with the spirits and wines, gave universal satisfaction. Mr. John Johnstone, farmer, Whitespots, was in the Chair, and Mr. William Smythe, farmer, Barscar, acted as Croupier. Many excellent appropriate toasts and sentiments were given, and the company separated at a late hour, highly satisfied with the proceedings of the evening.

**REARING OF CATTLE.**—The present rage for the exportation of stock, or rather the unprecedented encouragement held out by the London Market to our Scottish agriculturists, has spread over the North like a Lammis tide. We know one gentleman who has purchased to the extent of about £1000, and is shipping off his stock by the *Duchess of Sutherland*, and the *Earl Grey* sailing vessel, that the cattle may be in Smithfield at as early a date as possible. In Cromarty and Roth-shires the farmers are equally on the alert; and in Caithness, we heard a good practical judge remark lately, there is at present as fine a show of excellent bred cattle as can be found north of Berwick. The favourite breed there is from the Teeswater bull and Highland cow; and this description of stock has been brought to great perfection, and reared in great numbers by Mr. Traill of Ratter, and Mr. Horne of Stirkoke. The latter gentleman, we understand, has at present one fine ox, four years old, which is considered even superior to the celebrated Dunearn ox. The transport of stock and goods from the North, has been so great that we observe a prospectus has been issued for another steam vessel to ply betwixt the Moray Frith and London! So

true it is, that all improvements grow up together, and are auxiliary to each other; if one lives it gathers round it others of a kindred description.—*Inverness Courier*.

**SALE OF FARM STOCK AT MOREHAM MAINS, EAST LOTHIAN.**—On Monday, the 16th of May, the extensive sale at Moreham Mains took place. The company present was numerous and respectable; and the result of the sale must have been satisfactory to Mr. Walker, the proprietor, as it was highly creditable to that gentleman as a breeder of the purest and finest description of farm stock. Every thing sold at what was considered to be very high prices. The fat cattle brought 9s. per Dutch, or 7s. 3d. per imperial stone. Yearling cattle, bred on the ground, sold at £9 9s. to £11 11s.; and two years-old short-horn £27 15s. One year-old bull brought as high as £45. The half-bred hogs, 32s. to 35s. Black faced wethers, fat, 40s. Cheviot and half-bred ewes and lambs, 42s. to 55s. Pure South-down ewes and lambs, and high-bred Leicester ewes and lambs, £3 10s. Work-horses sold from £20 to £40, and all descriptions of stock brought good prices. Our limits will not admit of any further enumeration of this extensive sale. Mr. Dingwall, the auctioneer, described the stock, and did his duty in a masterly style, much to the satisfaction of the gentlemen present.

**RAFTS ON THE RHINE.**—Those huge rafts which descend the Rhine to Dordrecht, and also in smaller masses to Amsterdam, and other parts of Holland, are remarkable objects in German industry and adventure. They also are for some time the site of habitations for those who navigate them. The women and children support their husbands and parents; and spinning, knitting, tailoring, dress-making, and other objects of thrift, are attended to with great industry. These rafts are nearly similar in construction to those I have seen floating down the St. Lawrence. In fact, floating timber down the American rivers in large masses was first attempted on the Hudson and St. Lawrence, by the early Dutch and German settlers. The rafts on the St. Lawrence and Ottawa are necessarily, on account of the rapids, bound stronger together than those on the Rhine: and the largest on the latter and on the American rivers, appeared to me much of the same dimensions—that is, about sixty to seventy feet broad, and six to eight hundred feet in length, with small plank-covered huts for the raftsmen to lodge in, and govern, while floating down the current, by means of anchors and immense oars or sweeps; boats also form an accompaniment. Like the river itself, these rafts gain magnificence in their passage. The timber which descends in small rafts from the Neckar, Murg, Maine, and Moselle, being afterwards connected at particular places, is all floated down the Rhine in one vast mass. The value of one of the largest rafts has been computed by Schreiber, at 350,000 florins, or about 30,000 sterling. It affords occupation during its course to from eight hundred to nine hundred persons. The consumption of provisions alone, from the time its construction commences until it is sold at Dordrecht, is stated at 45,000 lbs of bread, 30,000 lbs of flesh and dried meat, 15,000 lbs of butter, 10,000 lbs of cheese, 50 sacks of dried vegetables, 500 tuns of beer, 8 butts of wine, and several other articles. The live stock for fresh meat is carried on the raft, as well as every other article of provisions. The history of a large Rhemish raft, from the time the trees are beginning to be felled in the forests of Germany and the raft constructed, to its delivery at Dordrecht—its separation, whether for the saw-mills of Holland, or for its exportation to other countries—and its final application, after going through the carpenter, wheelwright, joiner, or upholsterer's hands, to useful purposes—would form curious details of manners and employments.—*M'Gregor's Note Book*.

## DESCRIPTIONS OF SEVERAL NEW VARIETIES OF FRUIT,

Raised by T. A. KNIGHT, Esq., from Seed : together with Notes thereon by Mr. Knight.

The following account of some of the new fruits raised at Downton, has been prepared from descriptions made in the Society's Garden, by Mr. Robert Thompson, to which Notes have been added by Mr. Knight. As these varieties appear of considerable importance, it was considered desirable that an early opportunity should be taken of making the public acquainted with them.

1. *March Bergamot Pear*.—Fruit middle sized, in form and appearance resembling the Autumn Bergamot. Flesh buttery, a little gritty near the core, rich and excellent. Season, March, or later.—*Note*: Owing to its resemblance in form to the Autumn Bergamot, and its ripening chiefly in March (it may be preserved later), I have named this sort the March Bergamot.

2. *Pengethley Pear*.—Fruit middle-sized, obovate, a little curved at the stalk. Eye small and a little open; stalk about half an inch in length. Skin yellowish brown and considerably russeted. Flesh yellowish, juicy, and rich: a very good pear. Season, February and March.—*Note*: The Pengethley Pear remains in perfection quite as late in the spring as the March Bergamot; and it is larger and more juicy, and its appearance more inviting. Some persons who tasted both in the present spring, thought it the best pear of the two. The very high price of pears in the spring, in the London and other markets, induces me to think that both these varieties might be cultivated with much advantage. This first appeared in the Autumn of 1831, and was then very fine. The tree is large, and its growth excessively luxuriant.

3. *Ross Pear*.—Fruit large, obovate. Eye open and slightly sunken. Stalk short, moderately thick. Skin yellowish green, interspersed with russet. Flesh inclining to yellow, gritty near the core, but rich, juicy, and sugary throughout. Season, January.—*Note*: This first appeared in 1832. The fruit was all of large size; and I suspect that in a more favourable season and better climate, it will become very large. The growth of the original tree is extremely luxuriant.

4. *Oakley-Park Bergamot*.—Fruit middle-sized, roundish obovate, resembling a large swan's egg. Eye partly open, in a regular formed cavity. Stalk an inch and a half in length, rather slender and a little sunk at its insertion. Skin, greenish-yellow, sprinkled with russet. Flesh buttery and melting, rich and excellent. Season, October.—*Note*: The tree is of free growth, and has borne in the three last years.

5. *Brougham Pear*.—Nearly of the middle size, obovate. Eye open in a regular formed depression. Stalk short. Skin yellowish russet. Flesh yellowish-white, buttery, a little gritty near the core, sugary and rich. Season, November. This sort is highly deserving of cultivation where flavour rather than size is the principal object.—*Note*: This is not a small pear, though the sample sent was small. It is at least as big as the Autumn Bergamot; but I had sent away to several friends the largest and best samples; and I never saw my pears so small as in this year (1833) owing to what cause I do not know; but probably to the drought in the early part of the summer. I have named it the Brougham Pear, a

sample sent by me to Lord Brougham having been approved by his Lordship.

6. *Bringlewood Pear*.—Fruit middle-sized, pyriform. Eye open, with the segments of the calyx prominent. Stalk long and rather slender. Skin yellowish brown, almost covered with russet. Flesh yellowish-white, a little gritty near the core, the rest buttery, rich and very excellent, with something of the peculiar flavour of the Monarch Pear. Well deserving of cultivation. Season, end of October till beginning of December.—*Note*: This variety did not prove nearly as good in the following year as in that in which the sample was sent to the Society; it was nevertheless a good pear, though inferior to others of the same season of maturity.

7. *Moccas Pear*.—Fruit middle-sized, obovate, with a short stalk. Eye somewhat open, and very slightly sunk. Skin brown. Flesh inclined to yellow, melting, juicy, rich and high flavoured, resembling in this respect the Monarch Pear, and almost equal to that very excellent variety. Season December.—*Note*: This is, I think, a very fine pear, but the sample sent was not equal in quality to the former produce. \* \* \* Tree of excessively rapid growth, and very productive of blossom, which I have reason to believe capable of bearing, without injury, very unfavourable weather.

8. *Broom-Park Pear*.—Fruit nearly middle-sized, roundish. Eye in a moderate sized hollow. Stalk about an inch in length, moderately thick. Skin entirely covered with cinnamon-coloured russet. Flesh yellowish, melting, juicy, with something of a melon flavour, sugary and rich. Its very peculiar flavour may be said to partake of the melon and pine-apple. Season, January. A sort highly deserving of cultivation. *Note*: The singular mixture of flavour in this pear was noticed here as well as in London. The tree is fine, and has borne well in two seasons in which alone its fruit has existed.

9. *Croft-Castle Pear*.—Fruit middle-sized, oval. Eye open in a shallow depression, with the segments of the calyx reclining. Stalk about an inch and a half in length, rather slender, and somewhat obliquely inserted. Skin pale yellow, not glossy, but rough with elevated dots, and partially russeted. Flesh whitish, a little gritty, but melting and very juicy, rich and sugary. An excellent pear. Season October.—*Note*: A variety of dwarfish growth, but very productive of fruit.

10. *Eye-wood Pear*.—In shape and size very similar to an Autumn Bergamot, but of deeper cinnamon-russet colour. Flesh yellowish white, melting, buttery, juicy, and very high flavoured. It is doubtful whether it would be exceeded by Gansel Bergamot in a better season for standards than that of 1831, when the above description was made. Season, October or November.—*Note*: In 1833, when other varieties of pears did not attain their usual excellence in Herefordshire, this was found to be very good. The tree is of very free growth, and has borne well during the the last four years, the period commencing with its existence as regards a bearing state. The sample sent was below the average size.

11. *Dunmore Pear*.—Fruit above the size of a Brown Beurré, obovate. Eye open, slightly depressed. Stalk about an inch in length, of medium thickness, rather fleshy at its junction. Skin brownish-red next the sun; yellowish with a scattering of brown where shaded. Flesh yellowish-white, melting, and extremely juicy, sugary and rich: a little gritty near the core, but on the whole a most excellent pear. Season, end of September, or beginning of October.—*Note*: This variety is as large, I think, as the

Brown Buerré, and I have never tasted the last mentioned sort better than the Dunmore. When it has remained to ripen and grow yellow upon the tree, I have thought it the most melting and best pear of its early season. The birds are apt to destroy most of the crop prematurely. The tree is fine and perfectly healthy. Grafts of it, which were inserted into stocks two years only ago, afforded an abundant blossom in the last spring, and are now bearing fruit; though the weather in part of the spring was extremely unfavourable, and destroyed every blossom of the more delicate varieties. The trees are of very rapid growth, and the varieties appear to be extremely well adapted to cold and late situations.—*Transactions of the Horticultural Society of London, vol. ii.*

### TO THE EDITOR.

SIR,—Allow me to address a few lines to you on a subject which I humbly conceive may prove of immense advantage to the cultivators of the strong and retentive soils of this kingdom, who have suffered more than any other class of farmers from the low price of wheat.

Occupying a considerable quantity of heavy land in the county of Worcester, I have, from personal observation and experience, seen the great improvement to the land, and consequent addition to the crops of corn and grass, that may be derived from surface and furrow draining; and, knowing the imperfect manner in which many farmers (myself included) have done it, and of course been of little service, has prevented many from following a practice which its great utility deserves.

The average depth of surface drains is from 18 to 20 inches, the nearer the surface the better, taking care to keep them out of danger from the plough, tread of horses, and waggon wheels. The great injury to those drains where the common draining tiles are used is the sinking, and therefore the stopping up of the tiles, and the stopping up of them by moles, which was very ably shown by a correspondent in your paper from near Bridgewater. Now, unless flat tiles are used with the arched ones, and the greatest care taken in laying them to make both ends of each sort meet, the drains will soon cease running from one of the causes mentioned. This method of laying drains with two sorts of tile (which is the only safe one in use) is a very expensive one. I have therefore endeavoured to find out the most economical and at the same time the most perfect way of making such drains, and flatter myself the improvement I have made will be found fully to answer the purpose intended.

Having taken a brickyard for the purpose (after some experiments), I succeeded in making tiles of the same length as the common ones, but forming a perfect tube. These tube-tiles will not be so expensive as arched and flat tiles together by one-fourth; they will also (with the proper tools) be laid for one-fourth less money, and are not so liable to break with any kind of pressure; should a mole get in at the end, it must return or pass through the entire drain, and of course do the drain no injury. They will also keep cleaner; for being of very smooth surface inside, the water will wash them out. They are not liable to break in the carriage, and can be made of any size.

Should you or any of your valuable correspondents consider this improvement of sufficient importance to agriculturists generally, I shall, upon seeing an opinion to that effect, devise means (to all persons

desiring it) to supply them with the necessary information as to the expense, method of making, with the moulds, &c. used, and the tools employed to lay them to the best advantage.

I am, Sir, your obedient servant, R. S.

Worcestershire, May 16, 1836.

YORKSHIRE STATISTICS.—*Present Traffic by Land.*—The number of coach-passengers from York yearly to Leeds is 36,320, to Hull 18,224, to Selby 15,856, to London 23,360; total 93,760.—From Hull and Selby to Manchester and the West Riding of Yorkshire, 51,100; passing from the North to the South, and vice versa, by post horses, upwards of 20,000. The average coach-fare from York to Leeds is, inside 9s., outside 6s.; to Hull, inside 10s., outside 6s.; to Selby, inside 4s., outside 2s. 6d.; to London, inside 3l. 8s., outside 1l. 15s. The time of the journey from York to Leeds is 3 hours; to Hull 5 hours; to Selby 2 hours; to London 24 hours. The number of coach parcels from York to and from the towns above mentioned, yearly is 219,000; the charge upon each averages from 1s. 2d. to 3s. 4d. 110,600 sheep and 53,000 cattle are driven from York to Leeds annually, the former at the cost of 2½d. to 6d. per head, and the latter from 1s. 6d. to 3s. per head; the time occupied in the journey being from 1 to 3 days. The agricultural produce sent by carts from York to Leeds annually is 3,950 tons. The goods sent by waggon from York to Leeds averages 3,675 tons per year, at the average charge of from 13s. 4d. to 2l. per ton, the time of the journey being 12 hours. From York to Pontefract and Doncaster 572 tons, at the average charge of from 2l. to 2l. 13s. 4d., the time occupied by the journey being 6 to 9 hours. From York to Hull and Selby, 1,300 tons, at the average charge of 13s. 4d. to 16s. 8d. from York to Selby, and from 1l. to 1l. 13s. 4d. from York to Hull, the time of the journey to Selby being 5 hours, and to Hull 16 hours. *Present Traffic by Water.*—Passengers from Hull and Selby to and from York, 20,300; the time occupied in the journey from York to Hull is 9 hours, and from York to Selby 3 hours. *Goods.*—From Leeds and Wakefield and the respective neighbourhoods, about 98,000 tons of coal, and 4,000 tons of stone annually, at the average charge of 3s. to 6s. per ton. From Brotherton and Knottingley to York, 10,000 tons of lime annually, at the average charge of 3s. 9d. per ton; from York to Leeds and Wakefield, 30,000 tons of flour, grain, shelling, &c., at the average cost of 7s per ton. The time occupied in the journey occupies from 4 days to 10 days, a fortnight, and three weeks. From Manchester to Hull, 43,100 tons of cotton twist manufactured, and woollen goods, the time of the journey being from 6 days to 2 or 3 weeks. Between York and Leeds, York and Selby, and Hull, York, and London, 8,000 tons per annum of general merchandise.

CURIOUS PLANT.—In the island of Cuba is a plant which emits such an intense perfume as to be perceived at the distance of two or three miles. It is of the species *Tetracera*, and remarkable for bearing leaves so hard that they are used by the native cabinet-makers, and other mechanics, for various kinds of work. It is a climbing plant, which reaches the tops of the loftiest trees of the forest, then spreads far around, and in the rainy season is covered with innumerable bunches of sweet-smelling flowers, which, however, disperse their perfume during the night only, and are almost without scent in the daytime.—*Poeppig's Travels.*

## AGRICULTURAL SOCIETIES, No. 1.

TO THE EDITOR OF THE YORK CHRONICLE.

SIR,—The improvers of agriculture, may doubtless be classed amongst the benefactors of mankind. An increase of the supply of food is a national concern: a blessing conferred on each individual member of the community. But there is no class of persons whose character is less formed for adopting improvements than the farmers. This arises partly from their situation, but more especially from their habits. It is characteristic of human nature, when deprived of constant intercourse with persons of various casts of mind, to acquire habits of eccentricity. The farmers, in general, are far removed from each other;—seldom meet in bodies, and know little of each others' feelings or practice, except those immediately around them. Hence from their necessities arise habits; from habits, deeply rooted and inveterate prejudices. I speak this not to disparage the farmers, nor do I say that all are thus either situated, or constituted. Wonderful and amazing improvements have taken place amongst them, but they arose from their originators being exceptions to this rule. Of the breeders of cattle, Bakewell was doubtless the greatest, and first improver; but how did his improvements originate? To use his own words, by "seeing what others were doing." We never can expect to effect any general change in the character of the farmers, without we can bring them together. If this can be accomplished, it will be found to inform them of their mutual wants and imperfections; of the nature and importance of their situation; and will considerably tend to remove their prejudices, and lessen their antipathies to any improvements in the mode of cultivation of their ancestors.

But there are difficulties even in doing this. Something advantageous must tempt them; some "number one" return must be exhibited, or else their emulation, or their pride, must be excited. For this purpose agricultural prizes are invaluable;—they offer pecuniary profit, arouse emulation, and excite a diligence and activity in agricultural pursuits, to which, without them, it is in vain to expect to attract the majority of farmers. In alluding to agricultural societies, I may observe that they divide themselves into three classes. For the awarding of agricultural prizes:—for the extension of agricultural knowledge; and for political objects alone. The first mentioned class I shall refer to in the present article. They have effected much in the improvement of practical agriculture. They have roused a spirit of emulation and honest pride; have called forth the energies of the nobility of our country, and consequently have attached a degree of respectability to farming affairs, which it would otherwise never have attained, and which places it far beyond either the manufacturing, or commercial professions. The mixture of enterprising characters, of the higher and lower classes, has had a softening influence on both, and the jealousies,—would they were annihilated!—between landlord and tenant, have disappeared, and mutual confidence has been established. One objection may be raised against them;—that they generally award their prizes to *monsters*;—to pampered animals, loaded with fat, and where their distinctive qualities are lost in the accumulation of fat; that they are, in short,

"Too dear to buy, too fat to eat."

This objection is not, however, forcible as at first sight it appears to be. They have effected a desirable point; they have turned the attention of intelligent and unprejudiced persons to breeding;—have decided what particular *points* are desirable, and what

breeds and conformations are favorable to the accumulation of fat, in the shortest time, as well as the best kinds of food for effecting that purpose. Their meetings too, have disseminated and diffused the knowledge so attained, and experiments have been instituted by *gentlemen of fortune*, who could spare time, and expense, to effect their purposes; and which, though some were miserably and ignorantly conducted, and some totally failed, had the same ultimate tendency; furnished lessons of experience to the farmers who had neither the power nor will to buy themselves. Look, for instance, at the Smithfield Club cattle show. It has done more to further the breeding, and grazing departments of agriculture, in the above way than all the other endeavours put together. There are also other shows eminently useful in their localities, and they are springing up, and advancing, especially in the neighbourhood of large market-towns. It is a mistake, however, to think that they need to be so expensive as is generally imagined;—mere nominal prizes, in small places, will be formed to answer all, or nearly all, the useful purposes of more expensive awards; and it is extremely desirable to have them scattered through the country as they are attended with less expense in conveying the cattle, and equally serve to bring the best breeds and breeders into the notice of buyers. One fault is to be found with too many of their meetings. Why always choose the large farmers to be judges of the stock? Are not many of the smaller ones as intelligent, and of as sound judgment, and more so, than they? Another excellent plan is the giving of prizes to farm labourers, as performing specified work in the most workman-like manner;—as having been the longest term with one master; and having brought up the largest family without parochial relief. This cannot be too much encouraged, as it creates an independent spirit, and causes them to attach a degree of importance to themselves, which it is desirable they should possess. It is to be hoped that such societies will be universally formed, as they do not at all interfere with any party opinions.

W. E. N.

NEW POOR LAWS.—A letter from the clergyman of Wootton Bassett, states, that in that Union, the reduction in the last year's expenditure had been 6000*l*, compared with the prior year's expenses, which were 14,000*l*; that the agricultural labourers were in better employ; that the system of giving relief in bread was highly approved of by the poorer class of females, as such relief could not be turned to any other purpose than for the necessities of their families; that the custom at the beer-houses had very sensibly decreased; and that altogether there was a better feeling of respect on one hand, and a disposition to employ the labourer on the other, than had ever before prevailed in that neighbourhood.

SPANISH HUSBANDRY.—We have (near Saragossa) for the first time seen the primitive process of trampling out corn: the grain, almost as soon as cut, is laid down on a circular brick platform; a man stands in the centre of this and drives round the mules, which vary in number from two to four, according to the size of the platform; after the grain is trampled out it is separated from the chaff by being thrown up into the air in large wooden spades, the atmosphere being at that season so very dry that the lightest breeze is sufficient to carry off the chaff.—*A Summer in Spain.*

## PROSPECTS OF SCARCITY IN IRELAND.

Prosperity seems to prevail everywhere in England, as tranquillity does unquestionably in Ireland. The Englishman may say, and does say, that never was any thing so prosperous as trade, manufactures, and even agriculture. The Irishman, with equal justice, may exclaim, that he never remembers Ireland so tranquil.

There is one drawback, and it would be a breach of duty on our part not to notice it, particularly as it does not seem to have attracted much of the attention of our contemporaries—namely, the prospect of scarcity, and the actual suffering, at this moment, in a great part of Ireland. We have had, virtually, no spring, and within the last week or ten days we have jumped from rain, sleet, and hail, into the middle of broiling summer. There has been no vegetation worth speaking of in spring, and since the arrival of summer the grass has been burnt up, and grain is withering in the fields. Cattle are dying for want of provender, particularly on the western and northern coasts, and the people are already suffering the severest privations. Since Christmas the meat market has been raised forty per cent.; vegetables, including potatoes, are three times as dear as they were last year. In short, we are threatened with a fearful scarcity.

No doubt the enhancement of agricultural produce may, in some degree, be attributed to the quantity of money now in circulation. But this is not sufficient to account for the advance which has taken place. It is attributable, principally, we are satisfied, to the backwardness of the season.

This warning will not be found to be amiss; for we are satisfied that before many weeks shall have elapsed there will be calls upon government for relief to the peasantry.

And this is a period in which time for instituting some system of poor laws is still mooted. There can be little doubt, if rain do not speedily descend, another month will scarcely elapse when the cries of famishing thousands will reach the shores of the sister country, and there must necessarily be an outlay of money for their relief. But of this we are certain, that our Auhrim gentleman, who gives a man fivepence for a summer day's work, and who charges his serf seven or eight pounds for his con-acre, must be assessed. We preach patience; we are patient ourselves; but we reiterate it for the last time, that we can have no peace in Ireland worth a moment's fee until something be done to emancipate the peasantry from this unnatural position.—*Dublin Evening Post*.

**CARRIER PIGEONS.**—In the course of a lecture delivered on Friday evening at the Royal Institution by Mr. Mayo, on sensation, when speaking of instinct, he gave the following account of the carrier pigeon:—He stated that the Dutch variety was the most valuable, a pair of the best kind being worth from 5*l.* to 8*l.*; this bird is lighter than the English carrier pigeon, and flies nearly as fast again. It proceeds at the rate of 60 miles an hour—a mile a minute—and has been known to complete a journey of 800 miles; but this, it is presumed, is not continuous, but assisted by occasional rest. When the bird is about eight or ten weeks old, the trainer says it begins to run, that is, it flies away for four or five hours; then its education begins; it is taken about a mile from its place, and tossed; it returns. And this manœuvre is repeated every day for a week, and then the distance is doubled. After a time it is carried 3, 4, 8, 12, and 24 miles, until it is perfect in its exercises. The bird learns but one lesson; it may carry from Antwerp to London, or any other place, but it will only pass between the two places. It travels by sight. When tossed, it circles, then rises in a spiral,

observes its route, and darts off. It will not fly at night, and should the day prove foggy, its arrival will be much delayed, or the bird may be completely lost.

**UNPRECEDENTED CANINE ATTACHMENT.**—The following narrative of the affection displayed by a dog to its master, which continued after the death of the latter, and exists at the present day, exceeds any thing we have ever known, not only among the brute, but even among the human species. Hundreds living in and around the village of Dalrymple will readily attest the facts which follow. The animal was a common shepherd's dog, and his master was the late William M' Millan a cottar, formerly herd of the late Lord Alloway, "Aiton," for such was the dog's name, had long been looked upon, during his master's lifetime, as singularly sagacious. Among various traits of this, is the fact that he regularly accompanied his master to church on Sabbath; but would never enter the door. He lay down out side till the people were dispersing, when he singled out his master, gave a whine of recognition, and erecting his tail trotted proudly home before him. When his master was seized with the illness of which he died, all the inmates of the house could not keep the dog out of his bed; and, if by stratagem he was ejected, he kept up a constant moan, and at the ingress or egress of any one, he sprang past them, and nestled himself in the bosom of the dying man. When the vital spark had fled, his howling disturbed and alarmed the neighbours, particularly after night-fall, and if excluded from the bed in which the corpse lay. He watched, with anxious eye, the preparations for the interment, and followed the mournful procession to the church yard; but the grave he could not be induced to leave, and, unless he had been carried away by force, he would have exhumated the corpse. Ever since the interment, which took place at Martinmas last, has the faithful dog nightly gone to the gate of the churchyard, where he moans and howls without ceasing till day-light, when he returns home. The Rev. Mr. Wallace, Minister of the Parish, whose humane feelings are highly appreciated, ordered the servant to carry meat to the poor animal, of which he readily partook; but neither caresses nor threats were of avail in banishing him from his nocturnal watch. Several families in the immediate neighbourhood being disturbed by his cries, a son of his late master, residing at Galston, took the dog there with him; but within the last few days he is returned, and recommended his midnight visits and lamentations.—*Ayr Advertiser*.

**MR. COKE'S BIRTH-DAY.**—On Friday fortnight, the 82d anniversary of the birth of the above highly distinguished and consistent patriot was celebrated at Dereham by a dinner at the King's Arms Hotel, at which a large number of gentlemen of the town and neighbourhood assembled. The day was also celebrated at Wells and Downham Market with the accustomed cordiality, by agriculturists and landowners.

**THE CROUP.**—The *American Medical Surgical Journal* recommends to mothers and nurses, when a child is seized with that dangerous disease, the croup, to apply immediately and perseveringly, until medical aid can be obtained, to the throat and upper part of the chest, sponges or napkins dipped in water as hot as can be borne, and wrung out so that the water may not ooze from them. The remedy was first suggested by a German physician, and has been practised with decided and uniform success.

## AGRICULTURAL REPORTS.

### GENERAL AGRICULTURAL REPORT FOR MAY.

From the 27th of April, the concluding date of our last month's report, till early in the morning of the first of the present month, the atmospheric temperature, notwithstanding that the wind still continued to incline to the northward and westward, was tolerably mild, and, in some degree, vegetative, but by 3 A.M. had become—precisely as on that day twelvemonth—exceedingly turbulent, cold, and humid, the wind backing into, and blowing a strong gale, accompanied by frequent heavy showers of rain from the north-west, which description of weather continued till the evening of the fifth, giving to the whole range of both high and low vegetation a chilly and severely checked appearance; and afforded speculators in grain a plausible, but very short-lived excuse for demanding advanced prices. However, these unwelcome visitations having been followed by a full week's succession of mild, sunny, and otherwise summer-like days, vegetation very speedily resumed its best May complexion, and, though it has had to contend with a considerable number of cold nights and almost sunless days, has subsequently, owing, possibly, to the richly-mellowed state of the soil, by the before-mentioned heavy rains, and a few subsequent genial showers, become tolerably luxuriant, vigorous, and healthy. It has been an assertion amongst old farmers, from the earliest date of our acquaintance with them, that a cold May is ominous of good human and animal health, and full barns. Every description of live farm stock is represented as being generally healthy, and the generality of the pastures sufficiently stocked with grass to be capable of subsisting their full May numbers of sheep and beasts.

The wheat, oat, and barley crops are described as well-stocked, vigorous, and healthy, and the most backward part of the latter, nearly the whole of which was sown at, or very shortly after, the commencement of the month, is well above ground.

The hop bine, too, which is, generally speaking, according to the quality of the soil and situation on which it is growing, described as having crept from about four to nearly, or quite, six feet up the poles, is represented to be remarkably strong and healthy.

The field labours of the month have chiefly consisted of preparing lands for denchering, or burn-baiting, giving the second fallow, and picking of stones from those which are to remain uncropped till autumn, draining those which had been too much flooded by spring tides and drains, weeding, growing corn, &c.

As relates to the legislative and other political complexion of agriculture, farmers vehemently deprecate the result of the Inquiry of the Parliamentary Committees, relative to the Commutation of Tithes, and exclaim violently against the parsimonious rapacity with which the Church still clings to exorbitant tithes, the whole of which we have heard many of them—i. e., the farmers—declare, in

the course of the month, were given to it by law; therefore, in these times of agricultural oppression, the law ought to deprive it of an equitable portion of its enormous revenue.

The Central Agricultural Committee is said to be in a deplorably bewildered and desponding state, not knowing where to hide its diminished head, on account of having promised much and performed nothing!

As relates to prices of the produce of England's neglected soil, those of fat stock, on account of at least seven eighths of it passing, in some instances, through the hands of two, three, or more, jobbers, ere it reaches either Smithfield or Islington market, without having afforded its graziers more than barely moderate remunerating prices—are, for a period of 21 years of profound peace, exceeding high; whilst store sheep and beasts, generally speaking—milch cows, store pigs, suckling calves, good horses, poultry, dairy produce, wool, hops, hay, and corn—though the three latter have been looking a little downwards—are high enough, were there no intermediate profit, beyond a mere agency, to absorb the profits of their producers.

Here follows a retrospective statement of the supplies and prices of fat stock exhibited in Smithfield market—with the exception of that clandestinely smuggled into it—in the course of the four weeks, ending on May the 23rd, current year, &c.

		SUPPLIES.				
		Beasts.	Sheep.	Lambs.	Calves.	Pigs.
April	22.	700	3500	1500	200	390
May	2.	2320	11600	2500	280	450

Total ..	10576	55000	24000	2130	3102
Supply of preceding month. }	15070	79350	7350	2030	3310

It will be seen, by the foregoing numbers, that the supplies of the present month contained 4,494 beasts, 24,350 sheep, and 208 pigs less, 16,650 lambs, and 100 calves more, than those of last month.

PRICES.—At per 8lbs sinking the Offals.

	April 29.		May 23.	
	s. d.	s. d.	s. d.	s. d.
Inferior Beef . . . . .	2 6	to 2 8	.. 2 10	to 3 0
Middling, do. . . . .	.. 3 0	to 3 6	.. 3 3	to 3 8
Prime, do. . . . .	.. 4 4	to 4 8	.. 4 2	to 4 8
Inferior Mutton . . . . .	.. 3 4	to 3 8	.. 3 4	to 3 8
Middling, do. . . . .	.. 4 0	to 4 4	.. 4 2	to 4 6
Prime, ditto, . . . . .	.. 5 4	to 5 8	.. 5 6	to 6 0

SUPPLIES.

	May 25, 1835.	May 23, 1836.
Beasts	2,091	2,010
Sheep and lambs	20,750	17,400
Calves	153	225
Pigs	450	342

It will be seen, by the above comparison, that the prices of beef were from 2d to 10d; of mutton, 1s 2d to 1s 10d; lamb, 4d to 10d; veal, 6d to 10d; and of pork, 6d to 8d per 8lbs dearer on Monday, May, 23, 1836, than on the corresponding market day of last year, viz. May, 25, 1835; whilst there were 81 beasts, 3,350 sheep and lambs, and 108 pigs less; 72 calves more on the former, than the latter market day.

From the 29th of April to the 23d of May, about 485 of the beasts came up the St. Alban's Road; about 475 up the other northern roads; about 4,830 from Norfolk, Suffolk, Essex, and Cambridgeshire; about 720 from the western and midland districts; about 2,370 from Scotland; about 340 from Kent, Sussex, and Surrey; and the remainder, including about 160 towns-end cows, from the marshes, stall-feeders, cow-keepers, &c. near to, and within a few miles of London.

The mutton season of our northern districts is rapidly approaching its meridian height; though nearly, or quite, a moiety of the sheep, and by far the greater part of the lambs, come from our south-eastern, southern, and western districts. More than a moiety of this month's beasts have been Scots and Norfolk homebreds; about an eighth, runts and Devons; and not far from a moiety of the remaining eighth, Herefords; the remainder, chiefly Sussex, with a very few Irish beasts and towns-end cows; as also about 1,850 sheep, with not an inconsiderable quantity of slaughtered meat, chiefly mutton, by sea from Scotland.

LINCOLNSHIRE.

Immediately after my last report the weather changed from extreme wet to that of cold, dry scarping wind, chiefly from the north and east, with frosty nights, where it still continues without any appearance of removing; a few warm days intervened before and after the great eclipse with occasionally a south wind followed by a slight shower in some places.

The grass, however, has but little grown, and in the marshes the food for beasts is very scarce, and the usual quantity of sheep cannot be laid on; hence, the markets appear over-stocked, and both cattle and sheep have lowered in price.

The meat markets have kept up, first, because the winter-fed beasts are becoming scarce, and those which require a short time at grass cannot be turned

out except partially, and in the month of June the supply must be very limited, and consequently beef will be dear.

Then the grass sheep are fat, but the graziers clip sparingly to obtain a heavier weight of wool, and only send to market a sufficient number to make room for their store sheep.

Dry weather being the most propitious for wheat in the month of May, wherever that corn looked healthy it has grown rapidly, and is sufficiently forward; but those crops which were thin on the ground have not tillered out, and are growing up spiry and pale-coloured; while the stiff clays are not a half a crop; and the wire-worm is making great havoc in the East Fen.

The spring corn is set fast for want of rain, and in very few situations covers the land, the late sown having only about half come up, and the face of this county at large shows a smaller portion of luxuriant green than is usual at this season of the year; and, should the nights continue frosty and the weather dry another fortnight, the oat crop must be almost a total failure.

The beans appear short, but more healthy, and a fuller plant than for several years. I take it according to the old maxim, "Sow beans in mud, they will come like a wood."—May 21.

AGRICULTURAL REPORT FOR APRIL.—IRELAND.

FROM THE BELFAST NEWS-LETTER.

This month has been characterised by weather of remarkable severity, exceedingly unfavourable for the operations of the husbandman, and equally ungenial for the vegetable creation. Farm labour has been greatly retarded in consequence of the frequent and heavy falls of rain, and is in a very backward state in districts where the soil is of a stiff, cohesive nature. The land has been, at different periods during the month, in a tolerable working state, but it scarcely continued so 48 hours in succession. A great quantity of oats has been sown, the greater part of which under very unpropitious circumstances; and much of the ground, as yet, remains unsown. Very little spring wheat has been sown. Wheat in general has a weak, unhealthy appearance—thin, and far from being luxuriant. There is not so much thrown out as would have been expected by so many alternate frosts and thaws during the spring.—Young grass is pretty well stocked with plants, but rather backward, having been so much curbed by the frost and cold, bleak winds, which have been so prevalent during the preceding and present months. Any stones upon the surface should be gathered, and the grass rolled, as soon as the land is sufficiently dry to bear the treading of the working cattle. This crop should always be rolled—it consolidates the surface, which makes the clovers and grasses grow with greater vigour, and, in the mowing season, enables the workman to perform that operation with greater freedom and facility, and to cut it much closer to the surface. It is an old adage, and a true one—"that an inch at bottom is worth two at top." Where clovers and grasses are not as yet sown amongst the growing wheat, it should be done as soon as the state of the land renders that operation practicable; and the accompanying tillage requisite on the greater class of soils, is a double turn of the harrows along the ridges, and a single turn of the roller across. This process of tillage is highly beneficial to the wheat crop, almost under every circumstance, and particularly so when the roots of the plants are partially

raised above ground by too thick sowing, or the sudden contraction and expansion of the soil, in which state the plant becomes feeble, or perishes, if neglected. Where barley or oats are sown, or remain yet to be sown, after a green crop or summer fallow, under a proper system of rotation, clovers and grasses should be sown along with them. Any potatoes that have been planted during the month, have been chiefly put in by the spade, the ground being too wet for the drill husbandry. Beans, which are beginning to appear above ground, should be well harrowed across, which destroys the weeds that may be springing up, and tends to promote the vegetation of the plants. Care must be taken to clear out all the cross channels, to prevent the stagnating of surface water, nothing being more destructive to a crop of beans, at this stage of their growth, than to permit water to stagnate on the field. As soon as the grain crops are sown, no time should be lost in preparing the land for the potatoes, and have them planted. A thorough preparation of the ground is essentially necessary, by repeated ploughings, harrowings, rollings, and gathering of weeds. All the land intended for turnips should be ploughed across, and that intended for Swedish prepared as early as possible, as they require to be sown about the middle of next month. Summer fallows should also be ploughed in the direction of the former ridges, to keep down weeds and facilitate the subsequent operations. Stack-yards in general are thin. Prices of grain are still on the advance—potatoes are selling at from 1s 6d to 2s 6d per cwt. 2s current. Fat stock are scarce, and high prices are realized for a prime article. No class of men have felt the severities of this spring more acutely than the store farmer, particularly in the absence of artificial food. Where this has been wanting, sheep of every age are in very low condition, and their lambs of a very inferior quality. Good fat lambs, 6 and 7 lbs per qr. are bringing 1*l* each, and meeting with ready demand. Lambs are a fair average crop;

but ewes in general have not been so prolific this season as they have been for several years by-past. Farmers would do well to castrate all their male lambs, both single and twin, which do not indicate signs of fattening for market, so that if they cannot be sold advantageously to the butcher, they can either be retained, or sold for store stock. Whereas, if not castrated, there is no other alternative but to dispose of them to the butcher for whatever they will bring. A soft, mild morning should be chosen for the purpose of castrating, and a little of the spirit of turpentine put into the orifice with a feather, which is the most sovereign preventative of inflammation. Towards the 8th or 10th of next month, if the weather be genial and warm, rams, wedders, yeald ewes, and hoggets, may be washed, and shorn about eight days after. Wool is expected to maintain, if not exceed, last year's prices. We had a few days during the month pretty favourable for vegetation, but during the last eight days it has been comparatively inert, so that store sheep in general are still deriving but a very scanty subsistence. Tuesday the 26th was very tempestuous throughout the day; we experienced a considerable number of very fierce, sweeping showers of hail and rain, by which the ground was very much saturated, but the very high wind that prevailed next day, unaccompanied with rain, rendered the lighter class of soils in excellent condition for the reception of the seed. The 28th and 29th were also very favourable for agricultural operations in general; although we had several very bitter showers of hail, they were of short duration. To-day the distant hills are covered with snow, but it promises to be favourable for sowing. Pasture fields are entirely stripped of the green verdure which partially characterised them ten days ago. They have again resumed a withered, brown, January-like appearance. Vegetation almost inert, the air ungenial, and little appearance of any sudden change.—*April 30th.*

## AGRICULTURAL INTELLIGENCE, FAIRS, &c.

**HEREFORD FAIR.**—The supply of stock was not large, but about the average at our May Fairs. For fat beasts the demand was tolerably brisk, at the prices obtained at our Candlemas Fair; but stores moved off heavily, the necessary consequence of the scarcity of keep. There were more sheep and lambs penned than were expected. At the late neighbouring fairs sheep had receded a little, and on Thursday, they were sold at a reduced value, certainly not equal to the prices obtained within several months. The supply of pigs was small, hardly up to the demand; prices were therefore firm. In the horse fair the number was very large; and a great deal of business was done. Heavy draught horses sold readily, at comparatively high prices, and roadsters both for the saddle and harness, were bought freely at a good value. Useful animals of every description were in request. The following are the prices of stock:—Cattle, 5*l* to 6*l*; calves, 6*l* to 6½*l*; sheep, 6*l* to 6½*l* shorn; lambs, 7*l* to 8*l*.

**EXETER FAIR** was thinly attended. The show of fat bullocks, whether of oxen or heifers, has been small, nor has there been any thing like the anticipated eagerness to purchase; indeed, to buy there has been nothing that at all wore the character of competition. Plough oxen sold at from 30*l*. to 32*l*., and plough steers at from 22*l*. to 26*l*. per pair; bullocks that it may be estimated will graze 30 score in six weeks, have realized 12*l*. a-piece; while articles less forward,

and good barreners, have obtained a price answering to 6*s*. per score.

**BALLINASLOE FAIR.**—The May fair of Ballinasloe presented a large show of live stock of various descriptions. There was a good attendance of buyers, and a brisk demand, especially for store cattle, few or none of which remained unsold at an early hour of the day. Hoggets, store wedders, and well fleeced ewes were also in request, but the supply of sheep in general was, comparatively speaking, scanty. The horse fair was rather thinly attended, but there were some beautiful animals exhibited on the green, which brought very fair prices—an inferior description of horses were in no demand, except strong farming draughts, which, in some instances, brought from 12*l* to 15*l*. The following are the rates at which farming stock sold during the day, and which we give from personal observation:—Prime fat cattle, 13*l*., 14*l* 10*s*., 15*l* 15*s*., and 16*l* 8*s*.; and superior stall fed, 20 guineas; store cows from 6*l* to 8*l*., and large sized ditto up to 11*l*.; milch cows (general run) from 4*l* 10*s* to 7*l* 10*s*.; well bred ditto from 8*l* 10*s* to 10 guineas; springers from 4*l* 10*s* to 9*l*.; Durham in calf, 20 guineas to 25*l*.; two year old heifers, 3*l* 15*s* to 6*l*.; yearlings, 2*l* to 3*l*.; fat wedders from 50*s* to 3*l*.; store ditto from 33*s* to 40*s*.; ewes, 26*s* to 29*s*.; hoggets from 32*s* to 40*s*., and some 43*s* 6*d*.; lambs 15*s* to 1*l*.

**HEMEL HEMPSTEAD SHEEP FAIR** was well

supplied with stock, which fetched very high prices; some tegs were sold as high as 49s. There was a tolerable supply of cows, but few horses, and not much business done.

**MUIR OF ORD MARKET.**—The show of cattle was great. Mr. Sheriff, Barnyards, exhibited a lot of superior three-year-old stots, for which he refused 11l per head, and they left the market unsold; another lot, for which he refused ten guineas, also left the market unsold; he, however, sold three superior animals, three-year-olds, to Mr. Ritchie, cattle-dealer, for 13l each. Another lot of Caithness cattle were shown by Mr. Henderson, cattle-dealer, and was bought by Mr. Baxter of Arabella, for the purpose of feeding for the London market, at 9l, 12s 6d each. Several lots of smaller animals according to quality and age varied in price from 1l 10s to 5l. Very few cattle fit for the butcher were shown—consequently those brought forward sold at high prices; stot beef from 45s to 47s 6d sinking offals. A lot of fine Cheviot ewes, with their lambs, from Fingask, were sold at 35s each. There were no horses on the market.

**TO DAIRY FARMERS.**—On Tuesday week a meeting of farmers was held at Withington, near Uttoxeter, Staffordshire, convened by William Blurton, Esq., of Field Hall, for the purpose of exhibiting and explaining an invention of his, for milking cows. Mr. Blurton is already known as the author of several useful inventions connected with farming and dairying pursuits, for one of which, "The Swing Cheese Frame" he received a medal from the Society of Arts. On the present occasion a numerous and highly respectable party, from various districts of the county, and even from Shropshire and Derbyshire attended. After a substantial dinner at the Saddler's Arms, Mr. Blurton presiding at one table, and Mr. Hamp, of Walton-upon-Treat at the other. Mr. Blurton exhibited the "Milking Syphon," for which he has obtained a patent. It is a small metal tube, with a syphon at the lower end, and on its introduction into the teats of the cow, the milk flows freely out of the elder, without any manual labour. Mr. Blurton expressed himself confidently that, after a trial, most dairy farmers would prefer its use to the present method of milking by hand. Two objections which had occurred to the minds of several, that the cows might be injured by the use of the syphon, and that its introduction might occasion a constant discharge of milk, Mr. Blurton met by saying that experience had proved them to be groundless. Mr. Ritchie, a veterinary surgeon present, gave it as his decided opinion that cows would not be injured by the use of the syphon. Mr. Blurton's cow-man was called into the room, and any gentleman was allowed to interrogate him. He answered many questions, and said that he could milk sixteen or eighteen cows with the syphons, and would much rather milk sixteen with them than six without them. Several cows were afterwards milked in the yard with the syphons, and every one appeared astonished with the easy manner in which the milk was extracted from the cows by this new process. In consequence of being disappointed by the manufacturer, Mr. Blurton was unable to supply all the company with syphons. We do not say that every objection, or every degree of prejudice, was removed by the exhibition of the invention in actual operation; but it will now have a fair and extensive trial.

**IMPORTANT TO FARMERS.**—We have been informed by a very intelligent and highly respectable practical farmer in the neighbourhood of Haddington, that in the course of his experience, he has ascertained, beyond a doubt, that in growing potatoes a great advantage may be derived from simply plucking off the bloom from the *shaw* or stem, by which means the produce is much increased, in consequence, we presume, of the nourishment necessary for ripening the heavy crop of seed apples being, by this simple process, thrown back to supply the root. The individual, whose authority we quote, has, for many years past been an extensive potato grower, and he regularly adopts that method, by which the crop is increased at least 14 per cent; and as the operation can be done at a trifling expense, it is

certainly worthy of some consideration, especially as the farmer can so easily satisfy himself on the point in question. The same individual has made several other successful experiments in agriculture, an essay on which he intends shortly to lay before the Highland Society of Scotland.—*Edinburgh Journal*.

**SEED POTATOES.**—We are sorry to learn that symptoms are again observable this season of some mysterious defect in seed potatoes. A gentleman in the vicinity received a supply lately from the high lands south of the town. On being brought home they were examined by some of the servants, who expressed doubts of their soundness. The gentleman, however, having always got good potatoes from the same farm, resolved on giving them a trial, and several days ago planted about two acres. Having occasion subsequently to inspect a few cut potatoes that had been left, he found not only no appearance of sprouting, usually shown at this season, but found them in a positive decay. This induced him to examine some of those planted, when he found them in the same rotten state, with no appearance of vegetation, and he has it in contemplation to plant anew. The kind is what are known here by the name of Rough Reds, a kind usually valued somewhat highly. A quantity that he got at the same time and place called Smooth Reds, have all the appearance of freshness. Farmers would do well to pay good attention to the potatoes they intend to plant, as, independent of the price, the loss of time and labour is to them a very serious affair.—*Paisley Advertiser*.

**FLAXSEED.**—Last week there was a considerable re-action in the flaxseed market, owing to large importations from Glasgow and Liverpool. Prices declined greatly, though the demand still continued brisk. The breadth sown this season will be immense. It is calculated that from this district alone there will be the produce of from 30,000 to 40,000 acres, or from 7,500 to 10,000 tons, to be exported.—*Derby Journal*.

**MANGEL WURZEL LEAVES.**—At a dinner which took place a week since, at Downham Market, to celebrate Mr. Coke's birth-day, Mr. Milnes, Honorary Secretary to the West Norfolk Association, stated that he had successfully tried the use of hay cut with Mangel Wurzel leaves steamed for feeding bullocks, and strongly recommended the same to his brother farmers.

**GIGANTIC EGGS.**—A hen of the Crammer breed, belonging to Mr. Charles Dean, cordwainer, Carrington, has this week laid two eggs, weighing 6½ oz. The largest measures round lengthwise 7¾ inches, and in girth 6 inches. The girth of the other is about the same, but it is much shorter. One of them may be seen in the window at our office.—*Nottingham Times*.

The Park farm at Dunmow, containing about 70 acres of land, was sold by auction by Mr. Franklin, on Tuesday, for 5,000l.

**CHIPPENHAM WOOL MARKET, 1836-7.**—The Committee appointed to make the necessary regulations for establishing this market, have fixed the following days in each year as the most eligible for holding the market:—First Friday in July; first Friday in August; first Friday in September; first Friday in November; first Friday in February; first Friday in April. As an encouragement to dealers and farmers to attend the market, Joseph Neeld, Esq., M. P. has placed in the hands of the Committee the sum of One Hundred Pounds, to be given in such suitable premiums as they may think fit. The committee have thus apportioned the premiums:—To the purchaser of the greatest quantity of wool on the days aforesaid, a premium in plate, value 25l.—To the purchaser of the second greatest quantity of wool on the days aforesaid, a premium in plate, value 20l.—To the purchaser of the third greatest quantity of wool on the days aforesaid, a premium in plate, value 15l.—To the farmer who shall sell on the days aforesaid, the greatest quantity in weight of Southdown wool, of his own growth of the present year, a premium in plate, value 10l.—To the farmer who shall sell on the days aforesaid, the greatest quantity in weight of long or mixed wools, of his own growth of the present year, a premium in

plate, value 10*l*.—To the farmer who shall sell on the days aforesaid, the second greatest quantity in weight of any sort, of his own growth of the present year, a premium in plate, value 8*l*.—To the farmer who shall sell on the days aforesaid, the third greatest quantity in weight of any sort, of his own growth of the present year, a premium in plate, value 7*l*.—To the farmer who shall sell on the days aforesaid, the fourth greatest quantity in weight of any sort, of his own growth of the present year, a premium in plate, value 5*l*.—The bulk, or a sample not less than a pack, to be pitched in the market. Spacious sheds are about to be erected by Mr. Neeld at the back of the New Hall, for the accommodation of the dealers and farmers attending the Wool market, in which the wool may be pitched and stowed.

### MONTHLY REPORT OF THE WOOLLEN TRADE.

LEEDS, MAY 1.—The opinion expressed in our Report for March, that coarse woollens were then as high in price as the buyers could be induced to go, has been verified by the transactions of the month of April. Low goods have, it is true, been readily sold, but an advance of price, corresponding to the advance of cost arising from the rise of the raw material, has not been obtained. Profits consequently have been very small. Had a corresponding advance been pertinaciously demanded, the amount of business must have been greatly curtailed; as it is, we are indebted to the increased demand for North America for the principal sales of low cloths,—the home buyers and especially those from Ireland, have shown great caution in their purchases.

In the finer descriptions of Woollens more business has been done than during the two or three preceding months, but less certainly than the general state of trade throughout the country warranted us to expect. The complaint is general that fine cloths are very heavy of sale. We know of only two solutions of this state of our fine trade. Either the West of England houses are running a successful race with us in goods from 12*s*. to 14*s*. per yard, or the Foreign demand for those qualities has fallen off. Our belief is that both suppositions are to a certain, we hope to a limited, extent, true. Indeed our conviction for some time has been, that if our manufacturers seriously intend to maintain a successful rivalry in middle qualities with the West of England clothiers in the home market, and with the Continental manufacturers in the general markets of the world, they must infuse into their operations more energy than for some years has characterized them. We are persuaded they are losing ground in the race of improvement.

In the wool market there is a trifling alteration. Under 2*s*. 9*d*. or 2*s*. 10*d*. per lb., the quantity is small, the quality very inferior, and the price decidedly too high. Above that price there is still a fair assortment, and at a reasonable price, but it is little in demand.

The influence which this state of the Woollen Trade may have on the price of Foreign Wool at the ensuing clip, is too interesting to be left out of consideration.

We have just stated that the stock of low wools in the market is exceedingly light; the state of the stocks on the Continent may be inferred from the circumstance that, although the tempting price to be obtained here has induced very large exportations to England, the great bulk of the exportation has consisted of wools of inferior and even bad families—a very significant indication that the Continental stock of wools of the kinds most approved in this

market,—lies in small compass. These facts support the opinion, now very current, that German wools will realize an advance at the ensuing fairs on the price of 1835. We give no positive opinion ourselves; not that we are afraid to hazard one, or because we think the expression of an affirmative might have an injurious effect on the markets, but because we conceive that the price is contingent on two circumstances, which we can only imperfectly appreciate, and which mere opinion cannot affect, viz.: the extent of the whole demand of Europe, inclusive of England, on the one hand, and the extent of the whole supply on the other. These will be measured with tolerable accuracy at the great German Wool Fairs, and the price will be higher or lower as the one or the other may be in excess. We draw attention to the subject not to express a confident opinion, but just to remind the clothiers of the necessity of exercising a prudent forecast in their operations, and we will put two plain suppositions before them, and point out what we conceive will be the results of each. Either wool will rise in price—(a fall we consider altogether out of the question)—or it will not. Should it rise, they may calculate on getting their own by goods now manufacturing, or to be manufactured during the ensuing two months; but we doubt if even then they will get a profit. Should it not rise, we have no hesitation in saying, that unless they conduct their operations with extreme caution—in one word, if they fill the Halls with stock, they will find no small portion of their last four months' gains oozing through their fingers before next August.

This is no speculative opinion. The result we predict under the latter supposition will be simply a repetition of what took place in 1834 and 1835. The fact is, that, for some years back, the supply of wool from clip to clip has been so barely equal to the demand, that, just prior to that event in each year, the refuse wools have commanded considerably better prices than the richer parcels sold at first—and as the merchants have always experienced great difficulty in procuring a corresponding advance on the finished cloth,—they have met the dilemma, partly by pressing on the clothier, and partly by diminishing their own profits. The clothier and the merchant have alike worked for nothing during the last two months of the wool year.

Although our report is already somewhat lengthy, we cannot omit to take some notice of the Woollen Trade, with reference to its general condition—we mean as to soundness, and consequent safety and stability. First, as to profit: There is no question the manufacturers have done well; the staplers and the merchants know that right well; nor need the casual observer to be in any doubt about the matter, although we no longer see our stout Pudsey men riding home after a good market, to the imminent hazard of their own necks, and the lives of his majesty's subjects. They *drive* now, and he is a bad physiognomist who cannot tell by their countenances how they have fared. That the merchants have made a profit, the state of the demand, compared with the stock of goods, is decisive evidence, if, indeed, it were not quite clear, looking to the extensive resources and the prudence of a few houses, which transact the greater half of the trade of Leeds, that those who *can* command a profit have not failed to ask for one:—a profit, too, has plainly been within the reach of houses having less resources, and struggling for a connexion. It is true stocks on hand do not promise a profit; but they are light, and if ordinary prudence be exercised, during the next two or three months, there need be no loss by them, though they

may only nett a small gain. But profit is only made when the cash is counted down on the day of "prompt." We have little fear but that it will be forthcoming. Of the goods sold, a very large quantity has been taken off by the London houses for cash, or short payments; and that they have bought for consumption is evident, from their earnest inquiry for all colours under 11s. or 12s. The direct trade with country retail houses, whether in England or in Ireland, has been done safely; and it is any thing but overstocked—the latter market is notoriously but half supplied. Of the goods shipped, the bulk has been to order, or as *bona fide* sales, and we believe in no former year did a smaller proportion consist of goods on consignment. As a last evidence of soundness in the trade, we may state there is no speculation in land, for mills, &c., (indeed, we know of but one woollen mill in course of erection;) and there has been only a small addition of machinery for some time past. If, after all, there actually is overtrading, we confess we either do not know the symptoms of that commercial malady, or the disease itself has assumed a new form.

We are aware that prices are rising; and we are not unmindful of the rule that a general rise of price indicates an excess of money. We, however, greatly doubt whether the rise of wool since July last has anything to do with excessive issues. The price of wool was higher in 1833 and 4 than now, and it only fell about October in the latter year, after a protracted struggle. It is now approximating to the former level; but the facts we have stated, show, we think conclusively, that it is doing so from the pressure of a legitimate demand. We have, in more than one of our Reports, expressed our opinion that the tendency of price in wool is upwards, and that for some time to come; and as our reasons for that opinion lie in a small space, we will state them. Immense improvements have taken place in manufacturing implements and processes during the last fifteen or twenty years. The cost of manufacturing, apart from the cost of the raw material, has in consequence been greatly reduced, involving, also, a reduction of the price of the wrought fabric. The reduced price has induced a larger consumption. The effect of this has been a constantly augmenting demand for raw material—the evidence of which is palpable on the very face of our imports. But so far from there being any increased facility for producing that raw material, corresponding to the increased cheapness and facility for working it up, the very circumstance of an additional quantity being required, simultaneously with an increased demand for all kinds of agricultural produce, has tended to raise

the price,—so that the very improvements which cheapen the wrought fabric, raise the price of the raw material of which it is composed. We hold this to be the simple solution of the rise in price of all kinds of raw materials, used for wrought fabric, during the last three or four years. Wool, perhaps, more than any other fibrous material, has been affected by it, because the growth of it is limited by some special circumstance. It cannot be grown without immediate reference to the price of mutton, and the general routine of modern husbandry. No price for wool will induce the farmer greatly to increase his flocks, or to derange his regular system of stocking and cultivating. It is true that in New South Wales, the carcase is of little value, comparatively, but the wool grower cannot keep up the purity of his flock, and the character of his wool, without great care and expense; and these impose a much narrower limit on the extent of wool growing in Australia than is usually supposed. Combining all these circumstances, we think the advance in the price of wool is accounted for, without supposing that there is undue speculation in the raw material, or over-production by the manufacturer.

We would be understood, however, to advance no opinion as to the cause of the general rise of prices already alluded to. We are yet free to admit, that the facilities for obtaining money are greater—that in one word, the competition is rather amongst bankers for customers, than amongst customers for bankers; and that in the proportion of the issues of the new bands, to the amount of their paid up capital, there is perhaps too bold a reliance on their ultimate convertibility and solvency; but we must at the same time express our belief that the customers of those banks have drawn upon their liberality with a prudent and careful regard to the state of the ultimate demand for goods, and have avoided on the one hand large investments in raw materials and finished goods, and on the other have neither forced credit nor given it improperly. We hope, that in a short time, the check on undue issues of money, which is now too much in the hands of the borrowers, will be resumed by those with whom it ought to rest—the lenders. We may not come at this desirable result without some little disturbance of credit; but whilst we acknowledge that the proper and efficient mode is by the resumption of a more guarded system of credit by the bankers, we feel quite sure a great deal is within the power of the trading body at large. If there really be a tendency to an excess of money, that is just the reason why every prudent tradesman should conduct his business with redoubled circumspection.

## REVIEW OF THE CORN TRADE

DURING THE MONTH OF MAY.

The first week of the past month maintained the same ungenial character, which had prevailed during March and April, and the "ethereal mildness" with which poets were wont to celebrate the advent of May, assumed the garb of winter in its roughest mood; and serious apprehensions were being entertained for the fate of the young wheats, and Spring corn; on the 7th, sunshine, however, again obtained the ascendancy, and the wind veer-

ing to the southward, the days became warm and glowing, and all Nature exhibited the vivifying influence which the combined powers of heat and moisture are capable of producing; yet the growth of wheat and Summer corn has not been as rapid as it would have been, had the nights been more favourable; this very period when vegetation makes the greatest progress, a chilly, cold, and often frosty temperature has been prevalent. To-

wards the middle of the month, agriculturists from all parts of the United Kingdom were complaining of the want of rain, and the sudden transition from wet to dry weather, having caked or encrusted the surface of the land, checking the germination of the seed, and the Spring corn which had already reared its head, required moisture to invigorate its growth; a few refreshing but partial showers were then experienced, but succeeded by cool days and nipping nights, when the atmosphere again more mild and beneficial to the "tender blades," and it is to be hoped that fine bright weather by day, and mildness of temperature at night, co-operating with the humidity with which the earth has been saturated, may communicate a greater vegetative impulse to the forthcoming crops, than is at present anticipated. It is however, confidently reported, by well-informed individuals, from different localities, that the young wheat plant on cold, strong, and low lands is, in many instances, too much deteriorated, ever to recover its primitive powers of vegetation; that the wheat has become *prick-eared* and *spindly*, assuming a yellowish, and in some cases a bluish tint, and the yield in consequence must fall short, compared with the growth on lighter soils, and more favoured situations, where the plant has tillered out well, becoming curly and strong, and wearing a dark and healthy green aspect, the index of luxuriance. A question would therefore seem to arise, worthy the consideration of the speculator as well as the cultivator, how far it might be deemed advisable the retention of their stocks, and how far the future prices are likely to be affected by a crop below an average return per acre, taking into the calculation that the securing of the grain is likely to be protracted to a later period than usual—that less land is under the cultivation of wheat, not only in England, but also in Scotland, and that in Ireland the diminution in the breadth sown is much greater than in either country, being estimated, though we believe vaguely, at even one-third the quantity of previous seasons; but reducing this amount half, and making it one-sixth, and adding the rough calculation which is current, that a deficiency of growth exists in Scotland to the extent of one-sixth, and in England of one-sixth to one-seventh, at the same time, that the consumption will continue as lavish as has latterly been experienced, which it may be inferred will take place, provided the same life and animation continue in the trades of the manufacturing districts; not omitting the increased ratio of the population since 1831, which then exhibited for the ten previous years, an augmentation of  $15\frac{1}{2}$  per cent., and would therefore for the five years nearly elapsed since the census was made, give an addition of upwards of three millions of human beings; taking all these facts into account, an inference may be deduced, that the currencies are likely materially to advance, and that the prospective character of the markets presents to the agriculturists not only a less gloomy, but a much more cheering aspect, than has been afforded them for the later consecutive years. As far as any opinion can be formed of barley and oats, from the early appearances of the plants, a favourable prospect is offered to the farmer, particularly as regards the former grain, but both are in need of rain. Beans and peas look strong and healthy, and in compari-

son, promise better at present, than any other crop.—The parliamentary proceedings during the month have only comprised two subjects materially affecting the agricultural interests; one calling in question the present system of forming joint-stock banks, the dangers emanating from which, and of an over-extended credit, were clearly set forth in an able speech from Mr. Clay, member for the Tower Hamlets, who stated, that the dangers to which our present system was exposed, arose mainly from permitting an unlimited number of persons to combine for the purpose of carrying on the trade of banking: he said—"you confer on them an enormous power of creating an extensive business, by rendering all the shareholders individually responsible; you afford the most dangerous facility in obtaining credit, whilst you take not the smallest precaution that such banks shall possess capital commensurate with the engagements into which the powers and facilities you bestow, will tempt them to enter. He could conceive no state more dangerous for any commercial community, than one in which a system composed of such elements should be in full activity, in which the country should be covered with joint-stock banking companies, enabled to extend their operations through the thousand channels open to them by means of their shareholders, and feeling no necessity to limit the accommodation they afford from want of funds, the place of which, for a certain length of time at least, their credit would supply. He could conceive no state more directly tending to produce that excitement, that over-trading, that apparent prosperity so pleasant in its advent—so bitter in its consequences; and that if there was one case in which legislative interference with the intercourse of individuals could be justified equally by reasoning and experience, beyond all doubt, it would be an interference to obviate the dangers which an abuse of the powers and facilities of joint-stock banking inevitably tends to produce, and the means he suggested to obviate the evil were, *limited liability—paid up capital—and perfect publicity*. Ministers coincided in the views of the Honourable Member, and a Committee was accordingly appointed "to inquire into the operation of the act of the 7th Geo. IV, c. 46, permitting the establishment of Joint-Stock Banks, and whether it be expedient to make any, and what alteration in the provisions of that Act." The other subject has been the progress made in the Tithe Bill; some material clauses having undergone discussion and amendments; but it appears doubtful if the measure will be passed into a law the present Session. The Agricultural Committee of the House of Commons is still sitting, and the evidence printed in the second report is fraught with much interest, as it fully elucidates the principles often urged in this Magazine, that supply and demand are the principal agents which have ever operated in depressing or raising the prices of the markets. The evidence also of the witnesses examined, as to the expediency of permitting foreign wheat in bond to be ground into flour for export, seems tending favourably towards the adoption of a measure, which would confer considerable benefit on one class of the community without inflicting injury or injustice, directly or indirectly, on any other. The

Agricultural Committee in the House of Lords closed its labours the third week in April, but my Lord Wynford has not yet made his report; the ardent zeal however exhibited by his Lordship at the "Central Agricultural Association" as well as by other peers composing the committee in behalf of the Agricultural interest, would have induced the hope that not a moment would have been lost in submitting to the House the result of their inquiries and endeavouring to relieve that distress, which they "many times and oft," have so eloquently depicted, as being in the power of Parliament to mitigate. The Committee, however, having it is understood adopted the motto, "*ex nihilo nihil fit*," the agriculturists can readily conceive the result of the investigation, and the benefits likely to accrue to them.

The markets throughout May, like the barometer, have fluctuated according to the weather. In the early part of the month, short supplies, and prevalence of cold and wet, induced holders to demand an advance of 1s to 2s, which in some instances was acceded to; sunshine, however, appearing, checked any further enhancement, and the currencies receded fully 1s per qr; these reduced rates were barely maintained until towards the close of the month, when the limited extent of the arrivals and the millers being short in stock, causing them to evince a disposition to purchase, the finer qualities of wheat, particularly of red, of which the show was very partial, obtained an advance of 1s per qr, making the top quotations higher to that amount than they were at the close of April though no improvement can be noted in the secondary and inferior descriptions; and the character of the trade remaining totally dependent on the weather and supplies, which during the month have been 7,500 qrs. less than April.

Though orders are still being executed in the Baltic and Elbe for the better qualities of wheat for English account, yet in many instances the limits have been 1s to 2s per qr less than the prevailing currencies at the different foreign ports, and the extent of the purchases has therefore not been large. The actual business transacting in bonded wheat on the market has been confined to a few purchases for the Cape of Good Hope, Mauritius, Canada, and United States of America; holders demanding fully the currencies realized last month. Hamburg wheat lately arrived has been held at 30s; and good Rostock qualities have obtained 29s; Danzig is noted at 32s to 35s.

The slight fluctuation which wheat has sustained in value has enabled the town millers to maintain the top quotations of flour, though sales have been made 2s to 3s per quarter below the nominal rates; while ship flour after receding 2s per sack rallied and regained 1s; remaining 1s per sack lower than at the commencement of the month; Suffolk and Norfolk being noted at 34s to 35s. The warm weather has operated on the sale of the article, as factors and millers are anxious to quit their stocks, and the bakers on the other hand not inclined to purchase beyond their immediate wants. Bonded flour has met a steady demand for export, and the fresh arrivals from the Baltic have been readily taken off at 24s to 25s per barrel for export to the West Indies, Cape of Good Hope and Mauritius;

to the former destinations the shipments have amounted to about 8,000 cwts, to the Cape 2,000 cwts, and Mauritius the same quantity.

The averages have continued to exhibit the advance, which had been previously experienced in the various articles. The aggregate averages of wheat has risen from 46s 1d to 48s 5d, making the duty 2s per quarter lower; but the London average has receded from 52s to 51s 2d. Barley has advanced from 30s 7d to 32s 6d; showing a difference in the duty of 3s per quarter; on oats the difference in duty is 1s 6d per quarter; rye, 1s 6d; beans, 1s 3d; and peas, 4s 3d: on the latter article the duty is likely eventually to recede to 9s 6d.

The arrivals of barley have considerably fallen off, and are upwards of 23,000 quarters less than the previous month. For nearly the first fortnight in May the limited extent of the supplies, caused prices of all descriptions to advance 1s per quarter; but finer weather setting in prevented maltsters from purchasing, and the maling season having thus sooner than usual been brought towards a conclusion, the trade in the finer descriptions has latterly ruled extremely dull at a decline of fully 2s per quarter, and the currencies quite nominal at this reduction, while distilling and grinding parcels have maintained their improvement; fine stout distilling qualities being worth 34s. The consumption of barley has been extremely large both for maling, distilling and meal, and accounts from the country seem to concur in the fact that the stocks are running excessively short; so much so, that many speculators are anticipating that a foreign import will be required before the next harvest is secured; in consequence of which the few parcels on hand, which are only of moderately good quality, have advanced fully 2s; no parcels being obtainable under 20s, and orders have been transmitted abroad, purchases having been made at Hamburg of Saale quality at 19s, and in Mecklenburg and Holstein at 17s to 17s 6d.

The stock of malt in the hands of the maltsters is not estimated as large, and the arrivals coastways have been 8,000 qrs less than during April. The trade has been steady, prices of good qualities having suffered no depreciation in value, but secondary and inferior sorts have been bought on rather lower terms.

In the supply of oats a deficiency has been exhibited as compared with April of 9,000 qrs; though from the English coast the receipts have increased 3,000 qrs, but from Scotland there is a falling off of 4,000 qrs, and from Ireland 8,000 qrs. Dealers and consumers having refrained from purchasing in anticipation of larger arrivals, and becoming in consequence bare of stock, have been obliged to come into the market at improving prices, and a good extent of business has been transacted at an enhancement of 1s 6d to 2s per qr, though with increased importations these prices will not be maintained; the improvement has been general in English and Irish samples, though in Scotch it has been difficult to realize more than 1s per qr on the finer descriptions, but the secondary and inferior coming to hand in better condition have risen 1s to 2s per qr. Bonded oats, owing to the demand for export to America and the West Indies, and the unfavourable weather

for the crops, have advanced fully 1s per qr, Danish having realized 15s per qr; Archangel have sold at 13s 6d, and Dutch brew at 17s to 18s. A few orders are being executed in Friesland, Holland, Jutland, Schleswick, Sweden, &c., for English account at from 10s to 14s per qr as in quality.

Beans have been in moderate demand, and prices steadily maintained until towards the close of the month, when secondary qualities might have been purchased on rather lower terms. Large orders are being executed abroad for shipment to this country, but the arrivals into the London port during the month have not as yet exceeded 2,000 qrs; parcels in bond are held at 28s to 30s; as, however, the crop is good, and the home supplies not yet exhausted, the speculative prospect is not particularly promising.

The supplies of peas have amounted to only half the quantity of the foregoing month; and, though the demand for boiling qualities has not been animated, yet prices have advanced 1s per qr, while grey and maple having met more inquiry must be noted 1s to 2s higher. The arrival of foreign peas has exceeded 12,000 qrs, and additional supplies are on their voyage or ready for shipment; so that on the duty attaining its minimum range, which is expected to be 9s 6d, the market is likely to be well stocked; prices at present demanded in bond are 26s to 30s per qr.

During the month of May, the following quantities of grain and flour have arrived in the port of London:—

	Wheat. qrs.	Barley. qrs.	Malt. qrs.	Oats. qrs.

In CANADA, though frost still continued at night, yet the thaw was making during the day great advances towards the opening of the navigation. The trade was dull, Lower Canada red being noted at 5s to 5s 6d per minot; fine flour, 31s 3d, superfine, 32s 6d. At Kingston wheat was worth 3s 6d to 4s, and flour 22s 6d per barrel.

From NEW SOUTH WALES no later advices had been received than those of the 7th of December, when wheat was selling at an average of 8s 6d per bushel; the weather was favourable for the crops, and though a heavy hail storm had been experienced at Sydney and its environs, yet it had not extended into the country, and the grain therefore had escaped its destructive power: it may be added, that the improvement in the growth of grain, and the considerable arrivals of wheat from

Van Diemen's Land and the East Indies, 2,000 qrs having been lately received from Calcutta, were the causes of the material decline in the prices. At HOBART-TOWN on the 22d of December wheat was noted at 7s to 7s 6d per bushel, and the harvest promised well, owing to the refreshing rains. Barley was rather scarce, and worth 5s 6d to 6s per bushel, and some English had realized 6s to 7s. At LAUNCESTON the same favourable reports were made as to the crops, and wheat varied from 7s 6d to 8s 6d; considerable shipments of the article had been made to Sydney from hence, as well as Hobart-Town.

The weather in FRANCE has been cold and unfavourable for the progress of vegetation. In the northern departments, in Normandy, in the western districts, and also in the southern, in Burgundy, in the eastern portions of the kingdom, in Champagne, &c., the prices of wheat have more or less continued to advance, owing partly to the extensive demand for the consumption, and in part to the unsatisfactory appearances of the crops in many portions of the country; in Picardy and Brie, from whence Paris draws a large proportion of its supplies, the farmers also complain of their prospects, yet not to the extent which is done in the other localities; in Beauce the promises are less unfavourable. At Marseille, Lyon, &c., the warehouses are reported as exhausted, and the return of the new crop does not seem likely to replenish them; harvest it is calculated even in the warmer departments will be at least fifteen days later than usual. Oats are backward, owing to the late period of their being sown, and the chilly character of the weather they have since experienced; but the progress of this grain is, however, rapid when the temperature is congenial to its growth. At Paris, though the prices are firm, yet speculative feeling is not yet influenced by the enhanced currencies of the country markets. At the ports of Cherbourg, St. Malo, Brest, Lorient, &c., the duties on the admission of foreign wheat in British vessels have declined to 10s 7d per qr, and if in French ships 7s 7d. In the neighbourhood of the Rhine the weather had become extremely warm, but had been suddenly succeeded by cold, which had checked the progress of vegetation. In the northern divisions of the kingdom the sowing of oats had not been completed in the beginning of May.

In ITALY the markets are extremely firm, and in some instances advancing, owing to the prevalence of cold rainy weather. At Naples Barletta wheat had rallied, and was held at 25s and 25s 6d, deliverable at the end of the month; the article being recommended as worthy speculation, as it is to be bought deliverable the end of August, at 28s 6d, the money to be paid on delivery; the seller retaining it in warehouse until the end of December free of charge, and at his own risk. Romanelli wheat was noted as high as 34s to 34s 6d. The weather was unfavourable, the Spring not having commenced, even on the second of May; wintry winds continuing, and Vesuvius still covered with snow. In SICILY at this season, mild genial weather generally prevails, but at the commencement of the month, the country was visited with heavy gales of wind, thunder, snow,

and inundations. At TRIESTE wheat and Indian corn had experienced rather better demand; the former article is noted at 25s 7d to 31s 4d, and the latter 18s 8d to 22s 2d.

In the BLACK SEA, the current prices remained steady at 22s 11d to 23s 7d, for the best qualities of soft Odessa wheat, and 22s 4d to 22s 11d for the best hard descriptions, but purchases after the arrival of the Spring supplies at Odessa, was being contracted for at much lower rates, say new samples at 17s 8d to 18s per qr.

In PORTUGAL the advanced prices of wheat, and especially Indian corn at Oporto, had caused some dissatisfaction to be expressed by the populace, and the municipal authorities had ordered for the consumption, the admission of the Indian corn in bond, as well as the stock of wheat in the warehouses, which was however very limited. At LISBON also, the maize in bond had been liberated, but it was uncertain as to the future intentions of the government in regard to wheat. The weather continued extremely dry.

At St. PETERSBURG the corn trade remained nominally unaltered; but linseed was selling for July and August delivery at 44s, and fine Morschansky 46s 8d per qr. At RIGA, wheat was quoted at 23s to 26s 10d for the best Courland samples. Some Russian oats were offering, weighing 74 to 75lbs, and held at 10s 8d. Crushing linseed varied in price, according to quality, from 42s 10d to 45s 9d; new sowing ditto, 26s 5d per barrel. At DANZIG the continued dullness in the trade in England had had little or no additional effect on the markets; really fine coloured high-mixed wheat of 61lbs had realized 30s in granary; good high-mixed of 60½lbs 29s 4d; fine white, 31s 6d. The old Volhynian wheats ranked among the best qualities received, and in a short time will be in excellent condition for shipment; indeed the Polish wheats generally prove of good quality, and when dried and exposed to the weather will make a good sample for the English market. The waters of the Vistula are represented as being so low, that many parcels bought on contract will be much later in their delivery than was expected; the supplies, however, were coming freely from the river Bugg, in consequence of the corn being laden in flat bottomed barges, which only draw a few inches water. At KONIGSBERG purchases continued to be made for England at 29s to 31s 6d per qr. At SLETTIN prices remained steady at 26s for wheat; but barley was held on rather higher terms. In MECKLENBURG wheats of best quality were not to be obtained under 25s 6d, and the finer samples came sparingly to market; barley met attention for English account, and was noted higher, say 17s to 17s 6d. Oats, 13s to 14s. In HOLSTEIN, wheat was still held at 24s 6d; but barley had been sought after for shipment to this country, and had advanced in price; best qualities were held at 17s to 18s. New rapeseed had been contracted for on French account deliverable at Hamburg, at 31½s taking the average produce of the season. At HAMBURG wheat was rather lower, but the best qualities of Marks weighing 62lb to 63lbs, were not to be obtained under 27s; barley had advanced in price, the article, exclusive of the purchases made for Portugal, being in demand for

English account. Saale samples, weighing 49lbs to 50lbs, had obtained 19s. Mecklenburg of 52lbs to 53lbs, 19s 6d to 19s 9d, and a sale had been made deliverable at Neustadt at 17s 6d, and the better descriptions were becoming scarce. Oats had been also purchased for England, a parcel weighing 37lbs, but rather stale, fetched 10s 3d to 10s 6d; Schleswick quality of 35lbs, and from the west coast of Holstein, brought 10s 3d to 11s; Mecklenburg parcels of 35lbs to 38lbs were noted as high as 13s to 14s. From Jeverland offers were making of 38lbs to 39lbs, at 12s to 12s 6d. From BREMEN considerable shipments of wheat had been made to the United States and Brunswick qualities had obtained 28s 6d per qr; beans, owing to the demand for England, had advanced to 21s to 22s. At ROTTERDAM wheat had become 6d to 8d dearer, owing to the article meeting speculative attention with the intent rather of shipping to the South of France and the Mediterranean, than to England. Red Rhine samples were held at 27s to 27s 10d; Kubanka of 62lbs to 63lbs, 27s 8d to 28s 2d. Thick oats, 15s to 16s 7d; feed, 13s to 13s 4d per qr.

LIVERPOOL.

WEEK ENDING MAY 21.

ENGLISH WOOL has improved a shade in value, more particularly skin wool, on which the inquiry has principally run. Combining fleeces, 19½d to 20½d; Down ewes and wethers, 19d to 20d; ditto tegs, 21d to 22½d; super. skin, 18d to 19d; head ditto, 15½d to 17.

SCOTCH WOOL.—We have this week to notice an improvement in the demand for Laid Highland wool. The inquiries have been numerous, and several sales made within our quotations. We have not heard of any business in Cross and Cheviot.

	per stone of 24 lbs.

White do. do.....	32s	0d	34s 0d
Import for the week .....	103 bags.		
Previously this year .....	2908 do.		

IRISH WOOL has been more inquired for than previously, but at reduced rates. For export there has been little doing, holders not appearing willing to submit to the prices offered. Business will probably continue in this state until new wools come to hand. Irish fleeces, mixed lots, 18d to 19d per lb; do, wethers, 17d to 18d; ditto hogs, 19½d to 21d; ditto combing skin, 16d to 17d; ditto short skin, 14½d to 16½d. Import for the week, 66, previously this year, 2,111 ditto.

FOREIGN WOOL.—There has not been much doing in foreign wool, but since Monday last the imports have been considerable, amounting to 548 bags. The New South Wales imports are looked for anxiously, and will probably be here in the course of a week or two. Odessa, fine, 2s to 3s 6d; Portugal R., 1s 5d to 1s 7d; Portugal, low marks, 1s 0½d to 1s 2½d; Spanish R., 2s 6d to 2s 9d; Spanish, F S, 2s 2d to 2s 4d; German fleeces, 2s 2d to 2s 6d; ditto assorted, 2s 6d to 2s 9d; New South Wales, 2s 4d to 3s; Russian wool, 8½d to 9½d; Buenos Ayres, 4d to 4½d; Mogadore and Barbary, 4½d to 6½d; washed Peruvian, 14d to 16d; unwashed ditto, 11d to 12d. Import for the week, 548 bales; previously this year, 6,221 ditto.

FOREIGN.

MAY 23.

The supplies of the week, ending on Saturday, have been about 2,000 packages of foreign wools, about 1,000 of which are the first clip of the season, from New South Wales, whilst several other vessels, the cargoes of which are mostly wool, are daily expected to arrive, from the same quarter; together with some from Germany and Spain. Private contract trade, though not so brisk as it has been, for some time past, is still healthy, at stationary prices.

BONES.

Since our last there have passed the SOUND, or by ELSNORE, and the GREAT BELT, ships loaded with Bones, bound for Hull, 3; Grimsby, 1; Lynn, 1; Newcastle, 3; Berwick, 1; other parts of England, 2; Arbroath, 2; Montrose, 1; other parts of Scotland, 3; also loaded with Patent Mist or Manure, for Grimsby, 1; other parts of England, 1; for Aberdeen, 1; Inverness, 1; other parts of Scotland, 1.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on *both* sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

### THE FLOUR TRADE AND THE CANADAS.

We take from the *Public Ledger* an article relative to the *modest* request of the Canadians, that they may be protected in their monopoly of the flour-trade with the other British colonies; the reasoning in which well merits the attention of the President of the Board of Trade. The reason the Canadians assign for continuing the restriction on foreign-grown corn imported into England, is a cogent argument *against* it, and must at once silence all the sophistry employed to persuade the British merchants and shipowners that they are no judges of what most nearly concerns them.

But whilst we are thus impoverishing ourselves, by this absurd restriction, how largely are we contributing to the lucrative trade of the United States! It appears by the American official returns, that the traffic in flour with the West Indies, the British American possessions, and the South American States, consists annually of about 900,000 barrels of flour, and may be computed in value at upwards of *one million sterling!* This trade is secured to them, at the expense of our mercantile and shipping interests, by the absurd prohibition now existing on the conversion of foreign grown wheat into flour, for exportation from England. That we could advantageously compete with the Americans in this trade, is beyond dispute. The price of wheat, on the average of years, is much higher in America than in the Baltic ports, and freights nearly double of those from England to the countries requiring supplies of flour, by reason of the Americans having little back loading; whilst to England the back loading is the principal freight; the outward voyage being sometimes in ballast, and rarely provided with more than part cargo.

Whilst these reasons may be fairly adduced to show that this country may be placed in permanent and successful competition with the Americans, there are others no less conclusive in favour of an immediate commencement of the trade, by a repeal of the prohibitory regulation. These reasons are well stated in a petition presented to Parliament from the merchants and others interested in the grain trade at the port of Plymouth, and we shall make no apology for transferring them here. The reasons the petitioners allege are—

“First.—The prices in America being unusually high, and on the other hand unusually low in England, the opportunity is afforded of establishing a new trade, and overcoming the difficulties inseparable from every attempt to divert it from its wonted channels.

“Secondly.—The prices of wheat in bond in England being about 25s and 28s a quarter, whilst in Ame-

rica they are 42s and 46s, the British West India Islands and Transatlantic possessions will be subjected to a charge for bread nearly double the necessary price, and without even the pretext of any national object.

“Thirdly.—Relief would be given to the holders of about 600,000 quarters of wheat, now and for some years wasting and consuming away in bond,

“Fourthly.—Not only will great advantage result to the millers of England and Ireland, and to the makers of casks, but nearly a clear gain in the freight be conferred on the ship-owners; and, lastly, these important objects may be promoted or secured, simply by re-enacting a bill, known as the Grinding Bill of 1824, which, in its provisions and operation, your memorialists respectfully submit is calculated to confer these benefits unmingled with the possibility of injury to any existing interest whatever.”

The apprehension of fraud which is the only thing now alledged against the conversion of foreign corn into flour for exportation from British ports, has been already shown in our columns to be without the slightest foundation. But we have now, in addition, the testimony of Mr. Hodgson, an intelligent and experienced merchant of Liverpool, who was examined before the last committee on the state of agriculture. We must give an extract from this part of the report:—

“6362. A petition has been referred to this committee from the town of Plymouth, in which they pray that a certain quantity of wheat which is now in bond, may be allowed to be ground into flour for exportation. What is your opinion of that, would it be a disadvantage to the agriculturists or not?—Undoubtedly an advantage.

“6363. Do you consider that it would be possible by any fraud to introduce a quantity of flour, free of duty, upon the market, if that were permitted?—Quite impossible, to any extent affecting the question of the propriety or advantage of the plan.

“6364. What security would you provide, or by what plan do you think it could be affected?—Simply the plan adopted upon a former occasion; to require for every quantity of wheat taken out of bond, an export in flour of its equivalent; hence ensuring that as much shall be taken out of the country as is admitted to its consumption.

“6365. What should you consider an equivalent? It was fixed in the act of Parliament to which I refer; I do not recollect the exact quantity, but it is there stated.

“6366. MR. CAVLEY—Is it 391lbs of flour to a quarter of wheat? The proportion of wheat to flour, in the present corn law which regulates the duty, is at 4 31-38 imperial bushels for each barrel of 196lbs net; but whether that was the exact quantity of the act to permit foreign wheat to be ground I am not sure.

“6367. How many pounds to the imperial quarter

would that make?—Five bushels to the 196lbs of flour, I now recollect was the quantity.

“6368. Mr. BARING—How would you prevent the evasion of the duty by the adulteration of the flour?—It is exceedingly simple. In the first place, there is no market in the world to which flour can be exported, where any but of the best quality will sell: all the flour exported from America, and which amounts annually to about a million of barrels, is exported to slave colonies, to the British West India islands and possessions to the South American States, and is food for the higher classes exclusively, and nothing but the best quality of flour will suit these markets. It would not, therefore, answer the purpose of any individual to export flour of inferior quality, because he must infallibly lose beyond what could be compensated by any gain in the duty. Again, America exports annually this million of barrels of flour from various ports on the line of her continent, and which is subjected simply to the branding of an officer appointed at each port; and so conclusive is that inspection, that American flour will sell all over the world, without other warrant than simply the brand, it having been proved by experience that the quality is ascertained with that certainty, that there is never any doubt upon it; it is merely asked whether the flour be branded superfine, and with that stamp it will sell as such all over the world.

It devolves upon those who object to the measure we now advocate, to demonstrate the fallacy of Mr. Hodgson's reasons against the presumed fraud, before any weight can be allowed to their objection. This, we apprehend, they will find some difficulty in doing, by whatever process they may make the attempt. There can be no doubt that the opposition proceeds from only a mistaken notion, that what is asked for would be injurious to the agricultural interest; and that the reason is “made for the nonce.”—*Shipping Gazette*.

#### STATE OF AGRICULTURE.

(From the *Mark Lane Express*.)

We had hoped that the Lords, whose time has not been very much occupied this Session, would ere this have enabled us to lay their report on the state of agriculture before our readers. They have long since closed the evidence, and from the ardent zeal shewn by some of the noble members of the committee on behalf of the agricultural interest, we should have expected that not a moment would have been lost in submitting the result of their enquiries as to the cause of agricultural distress, and their suggestions for its relief, whilst “the legislature” from which the parties moving for the appointment of the committee seemed to expect so much assistance, should be in a situation to act upon their recommendation. Our own observations, however, tend to confirm, the opinions we long since expressed, that the Session would be pretty nearly spent in the examination of witnesses, and towards the approach of the Michaelmas rent day, a report would be made, from which the tenant farmer would not be benefited, so far as any aid from the legislature was concerned. We constantly warned the tenant farmer from placing any reliance upon the delusive prospect of an amendment of his condition by the direct interference of the Legislature. Good will, however, unquestionably result from the enquiry made by, and the evidence given before the Committees of both Houses. The evidence given before the Committee of the House of Commons, contains a great number of facts deposed to, and opinions ex-

pressed by, individuals selected from amongst those who must, from their situation and pursuits in life, be well acquainted with agriculture, and matters bearing upon it. It is not in the power of any man, or set of men, to cause a rise in prices which shall be permanent, unless by the adoption of a system of legislation which in these days could not for a great variety of reasons, be tolerated, namely, a limitation of the quantity of corn to be grown. The opinions of the most competent judges, nay, the every day experience of *practical* men goes to prove that, although other causes may operate in a slight degree, still the main cause which affects prices, is the relative proportions of supply and demand. Mr. Sanders, who resides at Liverpool, is extensively engaged in the corn trade, and who has, it is clear, usefully given the subject much consideration, thus answers some questions put to him by Mr. Cayley:—

6914. You seem to have contemplated the effects of Mr. Peel's Bill in 1819; did the effects of that Bill exceed your anticipations in point of the mischief, or did it fall short of your anticipations?—I always thought that the effects of Mr. Peel's Bill as stated by Mr. Ricardo and its advocates at the time, were greatly understated; I had a sort of indefinite belief that the fall in prices would be much greater than was indicated by the difference between the standard and the market price of gold; but, upon subsequent reflection I am much inclined to think that the depression that has taken place was the result of causes much more remote than Mr. Peel's Bill.

6915. Did you ever read a pamphlet by Sir James Graham, called “Corn and Currency”?—Yes.

6916. Are you inclined to agree in the views taken in that pamphlet?—I do not recollect exactly what they were.

6917. There is a passage in it to which your attention is requested, “Corn the measure of value to which Mr. Malthus refers, fell in 1822 to 40s a quarter, and this was a scale of reduction lower even than he contemplated. I have endeavoured to prove that this was the inevitable consequence of Mr. Peel's Act of 1819.” Are you inclined to agree with that opinion, or did you agree with it when you read it?—No, I do not agree with it, for this reason, *I know that it was the state of the supply that produced the depression.*

6918. Is it not your opinion that Mr. Peel's Bill did cause a great reduction of prices?—I think it did cause a reduction.

6919. Can you lay your hand upon any measure that you think has been so destructive in its operation upon property as Mr. Peel's Bill?—I do not think it is fair to visit the distress that the country has suffered upon Mr. Peel's Bill; I mean to say that the present state of things would have come about, that nothing in the world could have prevented it. Mr. Peel's Bill said, here we will make a stand. It was incumbent on the nation to have a standard, and as certain as we sit here we should have had prices as low as we have now in the course of time as if Mr. Peel's Bill had never passed at all. The reduction in the price of commodities would have taken place if Mr. Peel's bill had never passed at all. England cannot do as she likes about prices and money.

No man can look at the immense importations of Foreign grain into the country at the period alluded to, without feeling satisfied that a vast depression of prices must have followed as a necessary consequence. Why the anxiety to exclude Foreign grain! Why the constant complaint of the introduction of Irish produce, if increased supplies do not occasion a reduction in prices? Why ascribe the high price of wool to the decreased supply occasioned by the dreadful loss of sheep from the rot,

if the state of the supply have no effect on the market? It is abundantly shown from the evidence of the several witnesses examined, that the recent low prices of wheat arose from the increased quantity produced; and the anticipation of a decreased growth is now acting upon prices and must necessarily produce an advance. The following extract from the evidence of Mr. Hodgson, furnishes important information on this subject:—

6345. If it could be proved to demonstration that there was a less breadth of land sown with wheat, is not it fair to presume that there would be a greater speculation in corn?—I have no doubt, if the opinion I have expressed with regard to the diminished extent of land under wheat for the crop of this year, were established by facts before the Committees now sitting on Agriculture, that a most important rise would be the result, because the price is still 16s. to 20s. a quarter notwithstanding the advance which has recently taken place, under the average of the last fifteen or twenty years. I have no doubt, also, though there is a considerable stock of corn in the country, that the stock has been decreasing; in short, the recent rise itself is a manifestation in favour of that opinion, for I am unaware of its having arisen upon any other ground than conviction that wheat had reached its maximum of depression; and if, connected with the conviction that the stock is now in course of reduction, it should be shown from evidence adduced here, that there is a smaller breadth of wheat under cultivation, to an extent such as I have no doubt can be proved, I entertain not the least doubt that prices would very quickly reach at least an average which, as already stated, would be 15s to 20s above what they are at present: and should such a result follow, the benefits would be almost entirely to the agricultural interest; for speculation having so long been dormant, there is a very small proportion of the existing stock of the country in the hands of any other than farmers; and if within a month an advance of 15s to 20s a quarter should take place, the agricultural interest would derive a benefit of many millions, perhaps four, five or six millions sterling; whilst the other interests of the country would have no cause of complaint, being in that prosperous condition which would submit to the advance of price without murmur. There would be no grumbling from one end of the kingdom to the other; and the fact of short sowing, if it were established, would be more important as a measure of relief than any other which can be devised.

#### THE GERMAN COMMERCIAL LEAGUE.

(From the Leeds Intelligencer.)

One Saturday morning, about two years ago, the trading community of this district was thrown into disorder and alarm by the public announcement of a dire and awful calamity which had newly befallen us, and threatened to involve us in ruin—the Prussian Government had invented a Tariff imposing heavy duties upon the importation of English manufactures, and was inducing her neighbours to adopt it likewise.

True, the same announcement might have been made in the same words at any time within the preceding twenty years, notwithstanding which our trade with Germany had continued, some-how or other, to prosper during all this period, and our merchants engaged in it had remained in a most lamentable state of insensibility to the magnitude of the impending evil. But the organ of announcement did not address them; its field of operation had a wider range; for it is a mortifying fact to contemplate in this age of institutions, mechanic, literary, and philosophic, that the rule still holds good, or bad, whichever may be thought the proper term: the lower the point in the scale of intelligence addressed, the more numerous the auditory. Not that we would insinuate any comparison between organ and auditory in this case, which would be deemed odious by the latter: we believe they stood on equal terms, reciprocally

reflecting, supporting, and extending each other's ignorance in the most edifying manner imaginable.

The effect of the announcement was dreadful. We are assured by a friend here, who was known to be connected with Germany, that for days and weeks he could not walk the streets without being interrupted at every turn to answer alarmed inquirers. A feeling of compassion induced him at first to explain how the matter really stood; that it was merely an old fact which had happened to find its way into a cackle-box, whence it had re-issued as a new fact; that as far as past experience enabled us to judge, we had no need to give ourselves any great uneasiness for the future; and much more he added in the same soothing strain. But after the forty-ninth wearisome iteration of this exercise, our friend's patience became exhausted; yet he found the more he did the more he had to do. He thought of leaving home, or shutting himself up for a while; but other considerations forbade that mode of relief. At length he hit upon an expedient the use of which, in our opinion, nothing short of the direst necessity could even palliate, much less justify: the unhappy man, in the extremity of his despair, at once boldly denied that there was any such country as Prussia in existence! This was a ploy. Some inquirers, the compassionate sort, looked kindly, placed the tip of their fore-finger to the middle of their fore-head, and turned away with slow and solemn step. Others, the self-complacent sort, elevated their eye-brows, turned up their noses, and went their way rejoicing that they had, for once, met a man more ignorant than even themselves or their organ; and so at length it came to pass that the inquirers ceased from troubling, and the persecuted became at rest.

Even the immediate occasion which gave rise to the announcement at that particular time indicated the enlightened spirit in which it was made. Another state had joined the Prussian league; that was enough. English manufacturers must bite the dust. It was overlooked that the State in question had hitherto levied almost prohibitory duties upon English goods, but in adopting the Prussian Tariff had been obliged to lower these duties as much, we believe, as nearly one half. The State we allude to is Bavaria. But credulity was not yet satiated: the organ—we affect the word because it is a favourite with certain "influential parties"—the very same organ, two or three months afterwards, told its gaping admirers, on the authority of a congenial "well informed correspondent," that the league already embraced the whole of Germany, and thirty Principalities out of Germany! This is what the Schoolmen term that figure of speech which consists in putting the thing which is not for the thing which is; transatlantic refinement calls it "going the whole hog;" and O'Connell would exclaim "a mighty big liar!"

Such was the rise and progress of the delusion here. But it did not end here: its capabilities have been found important. It has become a stock piece for representation whenever the usual materials for excitement fail; in that character it has recently been called up by a London organ to perform duty in the absence of Parliamentary matter; and it may possibly, we would just hint, be expected to assist in diverting the public mind from the contemplation of perilous stuff nearer home.

It is this recent re-suscitation of the subject which induces us to turn our attention to it again.

We are far from underrating the importance of the German Commercial League. On the contrary we rank it amongst the most striking results of modern statesmanship skillfully and successfully applied to the promotion of an enlightened object; that object being the removal of all restrictions which prevented the freedom of internal communication between the different German States. Each of these States had its own peculiar Tariff of duties, for the levying of which each had to maintain its own line of custom houses. The vexation, the expense, the delay which arose out of this anomalous state of things rendered it an insuperable obstacle in the way of all comprehensive views for the general good of the land. Some idea of it may be formed if we imagine each county in England to have its distinct scale of duties upon all goods not produced within its own limits; Yorkshire goods paying duty

upon their introduction into Lancashire, whence they could not be removed into Cheshire or Westmorland without the payment of another duty, and so on to the end of the chapter; foreign goods as well as English being thus subject to an additional impost as often as it might be found desirable to transport them from one county to another. We avoid this harassing system by levying one uniform duty upon a foreign article at whatever port it may present itself; this duty once paid, foreign goods are regarded as English, and both may pass from one end of the kingdom to the other without restraint or exaction. Let any one, then, place the map of Germany before him, and run his eye along the maize of dotted lines which divide that country into so many independent States, from the most petty to the most considerable; let him conceive the whole extent of these lines, threading in and out, and in some cases actually intersecting each other, to be studded with Custom-houses owning as many different masters as there are States, each State having its own duties to exact: he may then be able to estimate the intolerable grievance which such a want of uniformity imposed upon the country at large. It was not in the transport of goods only that the grievance was felt: the traveller experienced it at every turn. A few years ago the journey between Brunswick and Leipzig subjected the traveller to have his luggage examined at three different Custom-houses in the course of one day.

This is the grievance which is sought to be removed by the extension of the German Commercial League: it sweeps away all this interior net-work of Custom-houses, imposes one uniform scale of duties, and has one common external frontier within which all internal communication between State and State becomes as free from restraint as it is between one part of England and another.

We have no need to look for a merely self-interested mercenary motive on the part of Prussia, because she was the first to conceive and propose this bold design, since the whole proceedings of that power for the last twenty years in the career of substantial improvement enable us to assign a more liberal motive. In every department of domestic policy, in the perfection of her post-office establishment, her arrangement of public conveyances so as to facilitate communication, the construction of roads and other public works, she has held out an example to the whole of Germany which no other state in that country has yet succeeded in imitating; and in the higher duties of a Government, in her provision for the moral and intellectual cultivation of her people, Europe at large is content to copy her and practice the lesson she teaches.

But Prussia is a manufacturing country, and the duties imposed upon foreign manufactures are high; thus it is said, Prussia seeks her own advancement at the expense of other countries, and England is her principal object of attack. If this have really been the motive of Prussia in the formation of her Tariff, we can only say that she has, in this instance displayed a strange incapacity in the adaptation of means to an end. Of course Prussia must have been quite aware that she was opposing herself to no second or third rate manufacturing power in this adventure. She must have looked upon England as the scene where the triumphs of industry, science, and skill were most conspicuous: she must have regarded our advantages in this respect as the means which enabled us to outstrip all the rest of the world in the operation of accumulating value upon raw material. And how does she meet the case? Does she so contrive her impost that the labour and skill which form so important an element in the value of an article shall at all events be taxed? Not she indeed. The Prussian Tariff is framed on the most simple unsophisticated principle imaginable: the duties are levied upon the weight of the article! The labour cannot be weighed, the skill cannot be weighed; all that portion of the value which they represent passes duty-free. Duty is levied upon the material only. Hence the ruder and heavier the goods, the greater the proportion which the duty bears to the value. Surely this cannot be the mode of proceeding which a quick-sighted Government like that of Prussia would have

adopted if her object had really been to exclude the productions of a manufacturing country like England. But if we regard her object to have been simply the raising of revenue, the inconsistency vanishes at once. The chief articles supplied by our own market to Germany are so far distinct in their character that the manufactures of that country offer no efficient substitute for them; and they are, at the same time, so well adapted to the wants and habits of the people that even a high rate of duty will not drive them out of use. Hence it is that amidst all the outcry which has been raised from time to time as to the designs of Prussia against this country, we hear marvellously little as to the effects which have been actually experienced. We do not hear it alleged that the trade of this district with Germany has suffered; and a Manchester Correspondent of *The Morning Chronicle* who describes himself as an exporter of cotton goods to Prussia itself, and displays an intimate knowledge of the subject, denies that any such result has been experienced in that department.

The Prussian duties on woollen goods are 30 dollars per cwt. Upon a piece of common stuff goods this may amount to about five or six shillings, and the extra cost to each wearer of a dress will be about a shilling; far too little, we may be assured, to throw out of demand an article for which no adequate substitute is at hand. Upon the very heaviest and coarsest description of woollen goods sent from this market to Germany the duty will equal eighteen pence per yard, or 50 per cent upon the value; yet it so happens that the great bulk of these goods have all along been destined for Prussia, not through the medium of a smuggling operation, but subject to the payment of duty in the open Prussian Fair of Frankfort-on-the-Oder.

So much for facts, effects, and practical results. There is yet another view of the matter to be taken: it is hypothetical, we grant, and we use it hypothetically. Let us suppose that Prussia, in the formation of her tariff, had not been guided by the consideration of revenue, nor by regard for the interests of her own manufactures only, but had been influenced by a desire to extend her commercial intercourse with this country. We put the case in reference to woollen goods, in which our interest is most immediate. Let us then suppose that Prussia addressed herself thus:—These English manufacturers send us nothing but the very lowest and rudest of their productions; for the finer, the more costly description of goods, we are dependant entirely upon our native manufacture; yet England is the great workshop of the world, and we are but apprentices in the craft. How shall we remedy this; Let us lay on a duty by weight, which shall be as heavy, in positive amount, upon the low priced goods we now receive from them, as upon the most costly qualities they can send us. We shall then stimulate them to supply us with the very primest of their productions, and we shall enjoy the use of them.

We do not say that Prussia positively took this view of the case, but she would have been amply justified in so doing; for it is a fact that in the catalogue of our exports to Germany, *cloths* of any quality, fine, middle, or ordinary, form no item. A stray piece or so may occasionally be found in an enterprising draper's shop; he calls his friends to look at it as a curiosity, and they regard it as such—

“Not that they think it either rich or rare,  
But wonder how the devil it got there.”

Yet we flatter ourselves that no nation under the sun can equal us in the manufacture of cloths, and *mit Recht*, as the Germans say, and as the knowing ones think too, if the truth were always told. We make this observation without reference to the Prussian League, for it has applied equally to all parts of Germany, whether in or out of the League; to Hanover, to Brunswick, to Oldenburgh; even to Hamburg, which stands in the most proximate relation with us. Yet even the Prussian duty of 30 dollars per cwt. would not make more than ten per cent. upon a twelve shillings cloth; upon a fifteen shillings cloth hardly seven and a half per cent. And do our cloth manufacturers, with all

their skill and experience, fear to come in competition with the Continental manufactures under such trifling disadvantage? Nothing is more certain than that the mere want of skill in the getting up of a cloth will make a greater difference than this; one of our greatest manufacturers has been heard to declare that a difference of three shillings a yard, in saleable value, may be made upon a fine cloth in mere finish alone. Now good reader—gentle reader, we would have said, but the exercise we are about to put you through is somewhat of the ungentle—“take a single captive;”—let him be newly caught from any part of the Continent, provided only he have a coat on his back the produce of the land. Take him by the sleeve and rub it up: you will find the nap start upon it “like quills upon the fretful porcupine:” examine the tail of his coat; and you will find it, like the tail of O’Connell, a miserable commodity. Rude substance, the semblance of durability, are there; but no texture susceptible of high finish; and yet to such a commodity, we yield the supremacy over the produce of English skill.

The Prussian duties may be considered high, but to which of the great countries in amicable relation with us shall we be referred for a shining example of liberality by way of contrast? To the United States, perhaps, with her *ad valorem* maximum duty of fifty per cent., settling down by slow and painful steps to a permanent minimum of twenty per cent.; or to Portugal or the Brazils, where the duties are fifteen per cent. only; or to Spain, where they are not quite prohibitory; or to France, where there are no duties at all, because our goods are altogether prohibited. It should be borne in mind, too, that upon all goods brought to the great fairs, a deduction is made of one-third from the amount of the Prussian duty; and these fairs are the grand reservoirs whence all the main channels of German consumption are supplied. Our calculations, above, are upon the full duties, and require the benefit of this modification. Besides, if the Prussian duties be really too high they now stand the fairest chance of correction. As a single State, Prussia might have established the most absurd of tariffs, and stuck to it with the perversity of a political economist. But joined as she is with other states,

whose diversity of advantages and interests, natural and acquired, will make them quick to detect anything which presses too hardly upon them, she will be compelled to listen to reason; for according to the constitution of the League, each state receives a share of the general duties collected, in proportion to the extent of its population, and has a voice in the council which determines upon changes. Amidst all this diversity, and in the watchful jealousy which a compact of this delicate nature amongst independent states must call into play, we think we see ample security, monopoly and oppression by any one state for its own benefit. Let the attempt be but seriously made, and we are persuaded the whole structure of the League would tumble to pieces. Prussia has already admitted her nearest manufacturing rival, Saxony, as a member of the union: there is little evidence of the spirit of monopoly in this. The Belgian manufacturers, the greatest rivals of Prussia in the manufacture of cloths, are seeking admission to the union, and may, no doubt, obtain it. We shall lose nothing by the change: the Belgian duties upon our goods are much the same as the Prussian, and are levied in the same manner, by weight. All the difference would be that the Belgian and Prussian Custom Houses at Henri-Chappelle would vanish; and Antwerp and Ostend would serve the purposes of both. Some negotiations have been going on, also, to include Austria in the League, in which event the difference to us would be the admission of our goods into that country under the Prussian duties, in exchange for the prohibition under which they now labour.

If our commercial interests abroad have really been sacrificed for want of diplomatic care, it is the duty of our Government to see us righted. But we ought to have a very plain case; for our Rulers are not over prone to trouble themselves with such matters: we generally find them plenty of work at home. If they should find, upon enquiry, that we had neglected to avail ourselves of the advantages within our reach, they might dismiss our complaint at once as visionary, and say to us, in the words of Franklin, “God helps them who help themselves.”

## TURF INTELLIGENCE.

The season is sufficiently advanced to enable us to form an opinion of those young racers which annually excite so much attention throughout the kingdom, on account of the great stakes which are prepared for their competition, and which excite more attention than all the other events which are decided on the Turf: it will easily be perceived, that we allude to the three-year olds; amongst whom it would appear there is nothing of a very superior description;—neither a Plenipo nor a Queen of Trumps; a Leger nag or two still remain in the dark, which will most likely be kept so till the month of September.

But, to proceed consecutively. Since we last addressed our readers on the present subject, several highly important meetings have taken place; and, in the foremost of the list, stands Chester. For some previous years Chester Races had languished beneath the withering influence of intolerance, till at length the choice spirits of this distinguished and venerable city shook off their lethargy, roused themselves to laudable activity, and very much improved the Race List. The Trade Cup was doubled in value, and so well and so nicely estimated were the qualities of the va-

rious racers within reach of the Roodee, that the acceptances were more numerous than usual, and thus the prize was much increased in value. For many weeks prior to the day appointed for the decision of the Chester Trade Cup, the betting was very animated, particularly in Manchester and Liverpool, where speculation in the doctrine of chances is frequently carried to a very considerable extent. However, if the perception of the handicappers had been exercised with more than ordinary skill, the betting men suffered their judgment to be very much led astray, and adventured freely upon horses which, in the moment of trial, proved to be utterly unworthy of confidence. Thus, Jupiter was backed by the Manchester Turfites to a very considerable amount, for no reason that we can perceive, but because he was the property of Mr. Thomas Johnson, their townsman, as his previous performances entitled him to no such distinction. As the time approached for the decision of the Cup under consideration, Jupiter receded in a trifling degree, and Sir John Gerard’s Billinge crept into favour, most unaccountably, as he had never accomplished a single performance that could entitle him to the charac-

er of a racer, to leave superiority altogether out of the question. Red Rover had risen and sunk in the scale, and a few days before the event came off was the favorite. However, the evening prior to the race, something was whispered about Mr. E. Peel's Tamworth, and he took a decided lead in the betting. This horse won the race without difficulty, clearly proving that his competitors were a very indifferent lot indeed. More money was adventured upon this cup than upon any racing event which has occurred in the north western counties for half a century. The Manchester men were very heavy losers.

If the first day of Chester Races was remarkable on account of the interest excited by the Trade Cup, the meeting unfortunately became distinguished by a very disgraceful event the following day, when Mr. Barrow's Catherina came out for the King's Plate: she came on the ground ready saddled, her rider was weighed, and yet she did not appear at the starting post, but was taken away; and this highly reprehensible conduct produced the following decision, and well merited animadversion.

"The case respecting Catharina having been referred to us, and having heard such evidence as we could obtain, we are of opinion, that all bets made on or against Catharina, for His Majesty's Plate, should be void; and we cannot express in terms sufficiently strong, our disapprobation of the conduct pursued by the person having the management of Catharina, conceiving such conduct amounts to a deception of the public, and tends materially to injure the interests of racing.

May 4th, 1836.

E. M. L. Mostyn.—T. S. M. Stanley.—F. R. Price."

The Stand Cup on Wednesday brought out our favorite Queen of Trumps; and her majesty proved herself all right by cantering in for it with all imaginable ease. She appeared on Thursday for the Marquis of Westminster's Plate, and met with no competitor. A detail of this highly interesting meeting will be found in its proper place, and we particularly direct the attention of our readers to the very pleasing corollary attached to it.

York Spring Meeting commenced the following Monday, May 9; and closed on Tuesday evening; thus affording two very unsatisfactory meagre day's diversion. Old Ebor! how art thou fallen by bad management!

On the following day, Wednesday, May 11, the Liverpool Craven Meeting came on; where we expected Queen of Trumps would appear for the Trade Cup, particularly as she showed so well at Chester a few days previously; however, her absence is easily accounted for, and manifests the discernment and good sense of her owner. The space upon which the Liverpool Race Course is formed was, only a few years ago, one of those bogs so common in that part of the kingdom, and locally distinguished by the name of *Moss*, which amounts to what is generally understood by *Morass*. These Lancashire mosses are, on examination, found to consist of a dark-coloured sandy soil, held together, as it were, by that sort of ill-nourished vegetation which

is generally found in such places where the situation happens to be low. Those who originated the Liverpool Aintree Course entered upon the speculation with enthusiasm, and in order to render the ground as eligible as possible, they spared no expense, particularly in draining; in fact, so anxious were they to draw off the semi-stagnant water, and also to prevent its future accumulation, that they caused too many under drains to be formed; and the consequence has been, that, after a heavy day's rain, the Course becomes dry as rapidly as possible; the rain running through the light sandy thin-skinned soil like a sieve. Generally speaking, therefore, the course is very hard. Nor is this all: it is so formed, that the run down the further side, for about half a mile, gradually declines; while the run in, of about the same distance, as gradually ascends; in each case, placing a considerable strain upon the tendons of the racer. When to this, the hard and unelastic quality of the meagre turf with which it is covered is taken into consideration, it will easily be perceived that such a course is not very grateful to the feet of the noble animals of which our racing studs are composed, particularly after very dry weather, like that which immediately preceded the late Liverpool Races. Hence the reason Mr. Mostyn would not allow Queen of Trumps to start. Going on the beautiful turf of the Roodee, upon which the Chester Course is formed, could neither injure her feet nor tendons; while, at the Liverpool Course, both would have been placed in jeopardy, had she started.

General Chasse proved successful for the Trade Cup, after a very severe struggle with that second rate racer, Inheritor; while Tamworth, who had acquired laurels, a few days before at Chester, shewed what he has ever been, a middling sort of nag.

A BIT OF A MISTAKE.—On Tuesday week, a traveller arrived at one of the Commercial Inns at Ledbury, mounted on a regular Rosinante, a bare-boned animal, "lopped, cropped, wind-galled, spavined, quite gored, and blind" of one eye; several persons at the inn smiled when he alighted, but our traveller, nothing abashed, entered the house. He ordered a feed for his horse, and refreshment for himself, and said he had ridden very hard, having come from Gloucester in a little more than an hour; glances of incredulity were exchanged by the whole of the persons present, and one among them expressed a doubt of the possibility of *such a nag* doing the distance in double the time. The traveller, a warm-hearted son of Erin, was not very well pleased at his veracity being thus questioned, and offered to back his *animal* to go the next day sixteen miles within an hour. A wager to a considerable amount was subsequently made to that effect, and the match came off on Wednesday, betting being two and three to one against *barebones*. The place of trial was four miles on the Hereford road, twice and back. To the great surprise of many, the first eight miles were done in thirty-one minutes. The odds now rose upon time, but the knowing ones were duped, as the splendid old hunter, for such it proved to be, improved every mile, and eventually accomplished the distance (16 miles) in fifty-seven minutes.

A HERFORD OX  
THE PROPERTY OF STAFFORD ABBEY OF BUCHBERG PARK, NORFOLK-SHIRE.  
Exhibited at the Southfield Show, 1833.  
When Published by Chapman, July 1. 1846.

Drawn by W. H. Dore.

# THE FARMER'S MAGAZINE.

JULY, 1836.

No. 1.]

[Vol. V.

## THE PLATE.

The animal which forms the subject of the Plate is a four years and six months' old Hereford Ox, the property of STAFFORD O'BRIEN, Esq., of Blatherwicke Park, Northamptonshire. It was exhibited at the last Smithfield Shew, in Class 1, and although it did not obtain the prize, was highly commended by the Judges. It had previously obtained a premium at the Rutland Shew. There were many persons who prefer a moderate-sized well-framed beautiful animal, to the larger and more gigantic species, who would have awarded the palm to this beast, which was certainly a very fine specimen of the Hereford breed.

### TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—That the trifolium is a valuable and productive species of clover, appears now to be placed beyond all doubt, as it has proved itself capable of flourishing in this climate under a winter of ordinary severity. Such a winter was the last, and still thousands of acres have teemed forth an abundant and most acceptable produce. It is another merciful instance—among instances innumerable—of the care of a great and powerful God for his creatures here on earth. In the few observations with which I purpose to trouble you on this subject, I will divide my remarks into two separate departments; the first to relate to the best means of cultivating this plant; and the other to its value as a food for sheep and cattle when the crop is obtained. First, as regards its cultivation. The soils best suited for its growth are those, which may in a few words be described as those which have been found most congenial to the growth of red clover, and I confess, I have seen nothing yet to satisfy me that it can be cultivated with success on land which is too wet or thin for the general purposes of growing other artificial grasses. Persons very enthusiastic on the behalf of this plant have attributed to it, a capability of flourishing in the poorest soils; however, I repeat, I have not seen an instance of this sort, but I have witnessed several failures of attempts made to cultivate it on land, on which red clover has never been known to succeed. The time for sowing the seed is immediately after the ground is cleared from the preceding straw crop. I once heard a practical man give it as his opinion, that the later the seed was sown in the autumn the likelier the plant would be to bear up against a hard frost, and other ungenial weather; but the experience of the last autumn has, I think, fully established the propriety of getting the seed in the ground as early as possible. The quantity of seed sown to the acre should be at least one-third more than red clover. The reasons for this are two-fold, the seeds in the first place being larger do not seed the ground so thickly; and, like all other winter plants by being thick they protect each other from the weather; the latter observation is often experienced in cases of rye and winter tares, fields thickly planted always coming much earlier to use than those which are set thinner on the ground, and consequently more ex-

posed to the elements. Should the ground be ploughed or not? This question fully brings to bear the old maxim, that "doctors differ." My opinion is that the ground *should be* ploughed, the reader perhaps may think that it *should not be* ploughed, and so I will proceed to give my reasons for my opinion; but I will first call the attention of any *positive* opponent that I may meet with, to the fable of the camelion, whose colour was the subject of dispute with the Arabian travellers—one vehemently exclaims:—

"'Tis green—'tis green, sir,—I assure ye."

"Green," cries the other in a fury,

"Why, sir, do you think I've lost my eyes."

And both were right, and both were wrong—because the creature changed its colour with the various shades of light. And thus may it be with the trifolium—circumstances of soil and season may set at naught any given rule for its cultivation; in fact, experience shews this to be the case, but at the same time, I also think it has shown the ploughing for the seed to be the safer plan. It should be recollected that since the introduction of this plant we have had a succession of seasons favourable to the easy tilth of corn ground at the autumn of the year. If the trifolium has been sown after wheat—the wheat seasons—for the three years preceding the last—have been remarkably light and clean, and thus has the surface of the land after harvest presented a facility of tillage to the harrows not usually to be met with, and so the seed may have been well secured in the earth without the use of the plough. If on the other hand it has been sown after barley or oats, the winters for feeding off the turnips which these crops succeeded have been equally dry and favourable; independent of the dry summers and favourable autumns, which would apply in this case as well as in the event of its being sown out of wheaterop; all these circumstances are favourable, and in a degree account for the many instances of success of the insufficient operation of harrowing. If now on the contrary, this plant had become general in this country in the three years succeeding 1826, which were wet seasons, I have a strong impression that very few persons could now be found to advocate the harrowing system only, instead of the use of the plough; and if any such advocates under such circumstances were to have been found, I apprehend they would have been confined to the farmers on the light and best

turnip soils, where it is almost impossible to get an arid or adhesive surface. Let me be understood, that I do not recommend a deep ploughing, only just of sufficient depth to secure a healing for the seed, which should not be sown before the ground has undergone repeated harrowings and rollings; the firmer the state the ground is worked to the better will the clover flourish. I cannot convey the nature of the season that I would prefer for the trifolium, better than the mention of the circumstances which are thought the most desirable in sowing clover leys with wheat—the ground *disposed to work close and yet the harrows to go clean*. As regards its value as a food for stock, it has the triple recommendation of coming early—being very nutritious—and sheep and horses being very fond of it—if a little management be used in the first giving it to them. It seems to me to possess the peculiarity of having a taste, which stock object to at the commencement of feeding on it, but when once reconciled to this objection, they appear to prefer it to any other sort of green food. An instance occurred last year within my knowledge, which fully bears out the objection that stock in the first place entertain for the taste of the trifolium. A neighbour of mine had a land missed by his seedsman in the middle of a field which was sown with trefoil, and white clover. In the Autumn of 1834, when this omission was discovered the land was sown with trifolium, and which came on very well, as did also the other part of the field. In the Spring of 1835, this field was stocked with ewes and lambs to fat—a dry summer following, the lands were fed down remarkably bare, with the exception of the land of trifolium, which was comparatively untouched. These sheep not having been compelled to eat it in the first instance, never overcame the objection which they at first have for the taste and smell of this new plant; and in proof of their becoming to prefer it I have some sheep, which have been fed on it this Spring for several weeks, and they evinced considerable restlessness and discontent when they were taken from it, and put—some to crop on trefoil, and others to winter tares. It was some days before they again became quiet, during which time there was a decided falling off in their condition. I have also observed that horses having been fed on it will leave any other sort of food for it, and that they do remarkably well on trifolium, every carter in the kingdom, who has used it, will bear testimony. There is no question, but that it will produce more weight of food during the month of May, than either red clover, or winter tares;—this I have known put to the test, and the result was astonishingly in favour of the trifolium. I know an instance, this Spring, of 109 ewe tugs having been kept, the May month, on 240 rods of trifolium, being at the rate of about 8 rods per day. When they first began it, it was pitched off on the ground for them, and subsequently, when it became higher it was cut up and put into cages. I never saw sheep thrive faster at turnips and hay, than these sheep improved on trifolium, during last May.

With regard to its qualifications for hay, I am not prepared at this moment to give a decided opinion. There are now in the neighbourhood in which I reside, several pieces in swathe, and for which the weather for the last few days has been very unfavourable. I confess I think it probable that the red clover may be quite as preferable for hay, as the trifolium is preferable to the red clover for food for stock, in a green state. If, however, in the result, it proves to be less valuable for hay than the broad clover—and I think it will prove so—it may nevertheless be very acceptable during the next winter, as the stock of hay to

arise from the red clover will be unprecedentedly short.

The longer the time that has elapsed since the ground about to be sown with trifolium has been sown with any other sort of clover, the better the chance will be for a crop of the former. This observation, cannot of course, be acted on by the farmer who sows his land strictly in a four lair system, and consequently would sow the trifolium in a wheat stubble, which had been sown out of a clover ley, and which would be in a due course to be prepared for turnips the following summer; but where a different rotation of cropping is followed, it may be found possible to avoid the clover ley wheat crop for sowing the trifolium on, and to take in preference the land where a fallow, or pulse, or esculent crops, may have preceded the last corn crop.—I am, Sir, your obedient, and very humble servant,  
Sussex, June, 1836. AGRICULTOR.

### WILTS AGRICULTURAL SOCIETY.

The Spring Ploughing Match and Annual Sheep Shearing took place on Wednesday, June 15, at Market Lavington. Twenty-one ploughs started, a greater number than on most former occasions. The premiums were awarded as follow:—

In the first class, being two horses without a driver, the first premium was awarded to John Drewett, servant to Mr. Haines, of Erlestone, who ploughed his half acre in two hours thirty minutes; the second to John Pearce, servant to Mr. Fowle, of Lavington, who ploughed his half acre in two hours thirty-six minutes; and the third to John Baker, a servant of Mr. Russell, of West Lavington, who ploughed his half acre in two hours nineteen minutes.

In the second class, being two oxen without a driver, the first premium was awarded to John Champion, a servant of Mr. Grant, of Coulstone, who ploughed his half acre in three hours twenty-two minutes; the second to James Crook, a servant to Mr. Richard Box, of Chiverell, who ploughed his half acre in three hours twenty minutes. The third candidate not having performed his work in the time specified by the rules of the society, was considered to be excluded from receiving the third premium.

In the third class, with horses and a driver, or with four oxen and a driver, the first premium was awarded to Jas. Bevan, servant of Mr. Tuckey of West Lavington, who ploughed his half acre in two hours ten minutes; the second to Wm. Mead, servant of Mr. Jeremiah Gye, of Fiddington, who ploughed his half acre in two hours five minutes, and the third to Stephen Goddard, servant of Mr. Bevan, of Gore Farm, who ploughed his half acre in two hours fifteen minutes.

The Committee recommended the usual bonuses of 5s to be paid to all the unsuccessful candidates, who performed their work in the prescribed time.

**SHEEP SHEARING.**—1st Class.—The first premium was awarded to John Smith, of Uphavon; the second to James Oram, of Uphavon; and the third to David Chapman, of Littleton.

2d Class.—1st premium to Thomas Wells, of Uphavon; the 2d to John Church, of Overton; and the 3d to William Davis, of Littleton.

The Committee recommended that a bounty of 2s 6d be given to each of the unsuccessful candidates, the whole of the shearing being remarkably well done.

The only candidate for the premium for rearing lambs, was Thomas Baily, shepherd to Mr. E. G. Polhill, of Charlton.—Mr. Polhill declaring that Baily reared 212 lambs from 220 ewes, all which lambs had fallen since the 10th October, and were living on the 1st May; and that 218 of the ewes were living on the 1st May.—The first premium was consequently awarded to Thomas Baily.—From the circumstance of this being the only claim, it is inferred that there is a bad breed of lambs in the neighbourhood, this season. The above ewes were full mouthed.

## THE CENTRAL AGRICULTURAL ASSOCIATION.

A meeting of this association was held on Friday, June 17, at the Crown and Anchor Tavern, which was very numerous attended. The Duke of Newcastle presided on the occasion, and was supported by Earl Stanhope, Earl of Tankerville, Lord Darlington, M.P., Lord Wynford, Lord Kenyon, Sir C. B. Vere, M.P., Sir F. Slueckburgh, Colonel Sibthorpe, M.P., Mr. Ormsby Gore, M.P., Mr. Eaton, M.P., Mr. G. Palmer, M.P., Colonel Rushbrooke, Colonel Carnac, Mr. Bernard, of Trinity College, Cambridge, Mr. Branfill, Mr. W. Medley, Mr. R. Spooner, Mr. J. Richards, Mr. Allnutt, Mr. Round, Mr. Montgomery Martin, Mr. Escoff, and several other gentlemen who attended as deputations from various agricultural districts.

The noble CHAIRMAN shortly stated the objects of the meeting, which his Grace remarked would be fully detailed in a series of resolutions to be proposed for their approbation and assent.

Mr. ORMSBY GORE after a few preliminary observations, moved the following resolutions:—

1. That after succeeding governments had so fully acknowledged the great distress of the agricultural interest, and after his Majesty had so graciously, on repeated occasions, recommended in his speeches from the throne, the consideration of that distress, the Central Agricultural Society feels great regret that so small a portion of the surplus revenue should have been allotted to the relief of agriculture.

2. That this Society, whilst it looks with great anxiety for the reports of the several committees of the Lords and the Commons, cannot avoid expressing a hope that such acknowledgements of distress as have been made, must be followed by the recommendation of some measures of relief, and it deprecates the idea of the late rise in agricultural produce being considered as indicative of permanent prosperity. The Society, therefore, strongly urges the necessity of reverting to the principles of taxation as the means of affording essential benefit.

3. That the landed interest, besides paying as consumers the same indirect taxes as every other class of his Majesty's subjects, are also heavily and exclusively taxed for the payment of tithe, for county and parish rates, including the building of court houses of correction, lunatic asylums, &c., &c.; as also for the maintenance of prisoners, or patients, therein; for the making and repairing of roads and bridges; and though last, not least, for the heavy burden of the poor-rates.

4. That all these heavy charges, being for the benefit of the nation at large, should not be levied by partial assessment on land and houses almost exclusively.

5. That manufacturers have a great advantage over agriculturists by the skilful application of machinery, so as to diminish the expense of manual labour, for when men are no longer wanted, they are returned to the several parishes whence they came for support; but this advantage to the former is denied to the latter, for should they employ any machinery to the exclusion of manual labour, the agriculturists would still have to maintain the men thus excluded from work.

6. That the present system of taxation of the kingdom requires revision, inasmuch as that at the time the greater portion of it was established, the landed interest comprised the wealth of the country, more especially as regards the period of the enactment of land tax, and of the poor laws in Queen Elizabeth's reign. Whereas the relative value of property, at the present time, places the land, with its mortgages and other incumbrances, in the proportion of not one-half of the amount of the property of the other interests of the country.

7. That for the purpose of increasing the capability of the farmer to meet these outgoings, it appears necessary that there should be an extension of the circulating medium of the country, as far as a metallic basis will admit of.

8. That the establishment of banking companies, on sound principles, authorized to issue 20s notes, as has

been long the practice in Scotland and Ireland, to the great benefit of these countries, will tend to the benefit of the industrious classes of England.

9. That the Local Associations of Great Britain be recommended to turn their attention to these facts, and to adopt such measures as may best conduce to the attainment of a more equal distribution of taxation, according to the original intention of the Legislature.

10. That the landed interest, besides paying as consumers the same indirect taxes as every other class of his Majesty's subjects, are also heavily burdened with tithes, and taxed for county and parish rates.

EARL STANHOPE rose for the purpose of bringing forward his resolutions. His lordship spoke as follows:— Although the resolutions he should have the honour to propose to the meeting comprised several subjects, each of which was of considerable importance, he should feel it his duty in the observations he should make on them to be as concise as possible. It was incumbent upon them to take into their serious consideration the system of those men who were termed political economists, (*hear, hear*) and this was a question that all would allow to be of vital importance; (*hear*) that the system was one which the agricultural interest ought strenuously to oppose; (*hear*) but it was one against which they had no prospect whatever of success unless they adopted adequate measures; unless they acted with that energy and union becoming Englishmen in such a cause, and in a moment of great danger. And it was the more incumbent on them to take this question into consideration, because the work had now been laid aside; the political economists had thrown down the gauntlet, and it was now openly avowed by an organ of the non-productive classes, by a person whom he (Earl Stanhope) was, for the credit of the electors of Middlesex, ashamed to say was one of the representatives of the representation of this great county. (*Hear, hear.*) It had been asserted by him (Mr. Hume,) "that the people of England might dispense with the landed interest; (*tremendous cries of hear*), and that if England never grew a single bushel of wheat, barley, or oats, she might be still as great and prosperous as she was at present. (*Long continued cries of hear and shame.*) The meeting would allow him to call to their recollection a resolution which was almost unanimously adopted, (he meant with only two dissentient voices,) at the first meeting of their Agricultural Society, and which resolution he had the honour to propose. That resolution stated that the only means of remedying the extreme distress of the agricultural interest was by either raising prices to the level of the present burthens, or diminishing burthens to the level of prices. (*Cheers.*) In adopting that resolution, the society could not mean that it was merely to remain on their minutes without leading to any practical result. He did not suppose that in adopting that resolution as a basis and acknowledged principle of their proceedings, they did not mean to frame one or the other of those alterations, (*hear*), or in other words that an equitable adjustment, a measure surrounded with many difficulties but still imperatively demanded by justice, (*cheers*) was to be pursued, or that they were to adopt the other alternative, one that had been some years since adopted without opposition with great benefit to all of the producing classes, and one that offered to the minister of that day a source of congratulation; he meant the increasing the amount of the currency. Take either of these causes, and one or the other they were bound to take by their resolution, and he would beg of them to consider for a moment the antagonists opposed to them. (*Hear.*) They had those great luminaries of the age, those scientific philosophers who are the despisers of all that practical knowledge which the Agriculturists gained by practical experience; men who were wise in their own generation more than perhaps became the children of men, (*hear and laughter*) and who thought that by new fangled theories and by subverting successfully every principle on which the prosperity of this country was founded, they could open to the world a new millennium of happiness and prosperity. (*Cheers.*) These were opposed to the Agriculturists and not only these; (*hear*) they were opposed by the prevailing factions of

the country, he called them factions, and not parties because they had supported all the measures that had involved the country in so many difficulties, and had rendered it liable to the pressure of much severe distress. (*Hear.*) They were also opposed by the enlightened patriotic House of Commons now in the radiance and glory of its newly acquired popularity—by its newly accomplished reform. (*Hear, hear, and interruption.*) He would not give his opinions of the merits of that assembly. (*Interruption.*) Far be it from him to be guilty of such presumption; but was there a body of men in this country by whom that assembly was respected? (*Immense and long continued cheering and partial disapprobation.*)

Mr. BRANFILL rose to order, and considerable confusion ensued, in which he was understood to say that when he joined the Agricultural Society, he was informed there was to be no expression of political opinion. He thought the reform bill was calculated to confer blessings on the country. (*Great cheering.*)

Earl STANHOPE resumed. He was, he said, proceeding to state that they were opposed not only by a majority of that assembly (the House of Commons); but they were opposed also by a numerous and influential class; not only those whom the late Mr. Cobbett called jews and jobbers, (*laughter*) but by persons of fixed money income; (*hear, hear,*) persons who were necessarily inclined to concur in measures that lower the value of labour and increase still more and more the value of money. (*Hear, hear.*) He should, therefore, like to know, opposed as they were by such persons, with so formidable a confederacy arrayed against them, what prospect the agricultural interest had, (*hear*) and to whom and to what class of society the agriculturists were to look for assistance and protection; all that powerful assistance that would enable them to succeed in their views, with the full knowledge of all the opposition against them? They all knew that union is strength, (*hear, hear,*) and it was by union alone that they could succeed. (*Cheers.*) They well knew that all the agricultural classes, the landlords, the tenants, and the labourers have one common interest. (*Cheers.*) That which they had to effect was a solid union with the labouring classes; with those who lived by the sweat of their brow; it was to these that they had now to look for assistance, and it was the interest of the labouring classes to aid in the present struggle of the agricultural interest. What he would ask, was the interest of the labourer? (*Hear.*) His interest was to have full employment and good wages; and the better the prospect of the farmer, the stronger the hope of the labourer to obtain both. It was impossible for the landlord to prosper without the tenant also prospering. (*Hear.*) Each of them had rights to defend; the landlord, his rights vested in the soil; the tenant's rights to which the investment of his capital in the improvement of the soil, gave him a just claim; and the labourer his right from his production, by his labour, of property. (*Cheers.*) These classes being thus closely and indissolubly connected together, it was necessary for their common welfare; it was necessary for the safety of the country that they should on this occasion, combine together. (*Cheers.*) He wished to know whether this was a new principle now proposed for the first time; or whether it was not a principle which in other words, had already been acted upon by this society; the society said, "That every class interested in the permanence of the country's greatness, should come forward once more to exert their common energies to avert impending evils," (*hear, hear*) and without this union, it was utterly vain and hopeless for them to expect to succeed; but with such a union, he was confident that, whatever the views and wishes of Parliament might be, whatever ministers his Majesty might be pleased to call to the administration of affairs, the success of the agriculturists was certain. (*Hear.*) But it was not only necessary that they should embody great masses; (*hear*) they must have the weight of numbers; (*hear*) an object of importance, and which was daily recognized by all the other interests of the country, and which gave them that preponderance they had hitherto possessed. The assistance of

the labourers was essentially necessary in the operations of this society. Suppose it should be determined, as in the year 1823, to raise prices by an increased circulation; that would be utterly out of their power, unless they were supported by the labouring classes. If they adopted any measure calculated to raise prices, it was their bounden duty to take most especial care that the interests of the labouring classes should not be injured, but that to the utmost of their exertions they should be promoted. (*Cheers.*) If they took the other alternative, they would find themselves unable to carry that measure without the concurrence and cordial co-operation of the agricultural labouring class. It was not only this class that had a common interest; he considered that all classes of the community had a common interest, and that no one of them could profit at the expense of the other, in this great crisis; (*cheers*) and all of them should zealously unite for the common welfare. This was also requisite, to ensure the safety of the country; for there was no man who contemplated the present condition of the country, who viewed and appreciated the difficulties and dangers by which it was surrounded, who most not feel that circumstances might arise, that times were approaching, in which a powerful union could alone be effectual in preserving the tranquillity, and securing the safety of the country. (*Cheers.*) His Lordship then read his resolutions, and proceeded to say,—he admitted that, since the commencement of the present year, there had been a considerable rise in prices; but they must recollect that these prices rested on a most insecure basis, (*hear*) and the delusion would soon be apparent to the country. He asserted this in the presence of many better qualified from their experience than himself, to speak upon the question; still he would say, that if the present prices were maintained along with the present standard of currency, there would, as far as he could form a judgment, be a panic, such as occurred in 1825, when, according to the late Mr. Huskisson, this country was within twenty-four hours of a state of barter, naturally the precursor of a state of convulsion, or national bankruptcy; and if to avoid that danger the currency was contracted, they would then be open to low prices, and perhaps, a hundred thousand persons would be deprived employment. (*Hear.*) These considerations would not, he knew, have any weight with the political economists, for he was told by an honourable member of one of the houses of Parliament, in the middle of January last, when corn was 36s. per quarter, "that if the land could not be cultivated at that price, the land must go out of cultivation." (*Hear, hear.*) This gentleman was a landed proprietor, but he (Earl Stanhope) believed he was a larger fundholder. (*Hear.*) But had this gentleman any right to tell his tenants that their capital should be rendered unproductive?—(*hear.*) that their labours should be of no avail? (*hear.*) Had he any right to tell the labourers on his estate that they should be deprived of employment? (*Hear.*) He would say that they were landlords, tenants, and labourers, called upon to act as one man in protection of their common interests. The noble Earl here observed, that he would first submit three of his series of resolutions—on the third alone, of which, there might be some diversity of opinion. It was as follows:—"That it would be utterly impracticable to effect such a union without protecting the rights of industry, for which purpose, as well as from every consideration of justice and humanity, it is necessary to repeal the arbitrary, unconstitutional, and oppressive enactment, (*uproar, and immense cheering,*) of the New Poor Laws, (*renewed immense cheering,*) and substitute in their place a better system." (*Reiterated cheers, with considerable disapprobation.*) The resolution spoke of the "rights of industry." He had been asked—"What were the rights of industry?" He would say the right of every labourer to a full, free, and undisturbed possession of his labour. (*Cheers.*) The labourer had a right to require employment to be found for him, and that he should be sufficiently paid for that employment. (*Hear.*) This was a principle that should be held sacred; they would find it was from the highest of all authorities—that of the Holy Scriptures. (*Cheers.*) It was

there said "The husbandman that labourereth must be the first partaker of the fruits." This principle was recognized in the olden and better times of the English constitution; a principle proclaimed in the reign of that sovereign, whose name had been transmitted with glory to succeeding ages,—that principle was recognized by the 43rd of Elizabeth; (*hear, hear,*) that statute declared the poor should be provided, if necessary, with employment. When he heard so much against these poor laws, that had existed for two centuries with so much benefit to the poorer population, and so much in favour of the great improvements effected in them by the political economists, he was inclined to observe to them "You have subverted the prosperity of the country, (*cheers,*) by improvements in machinery you have deprived the labourers of their employment (*cheers,*) and you have thus reduced the county to pauperism, and when in consequence of this, pauperism reaches an alarming height, is it fair to cast the blame on those who proposed the statute of 43 Elizabeth?" The political economists had, by their improvements, (*hear,*) induced a state of pauperism, and had then sought its cause in a law which was repealed to make way for one of their improvements—the New Poor Law. (*Hear, hear,*) He had in his place in the House of Lords declared, that the poor rates did impose a grievous, and almost intolerable burthen falling almost exclusively on the owners and occupiers of land; but he had not urged this for the purpose of abridging the comforts of the poor (*cheers*), it had been the object of a long life with him to improve their condition; he had urged it in order that Parliament should be induced to retrace those steps that had created the pauperism; and if he wanted any confirmation of his opinions on the necessity of rendering the poor comfortable he should find it in those publicly expressed in Leeds, by a gentleman who he was proud to call his friend, he meant Sir John Beckett. In speaking of this subject his friend observed, "I say that peace at home means contentment, and unless we can establish such a system of things as will afford men a fair remuneration for their labour, and enable them to maintain themselves and their families in comfort, there can be no peace at home; there never will be peace at home, there never ought to be peace at home." (*Immense cheering.*) The new Poor Laws, to which he (Earl Stanhope) had several times referred, had been passed into a law on the recommendation of one who had been considered a friend of the productive classes, (*hear,*) he alluded to Lord Brougham. (*Hear, hear.*) In one expression of Lord Brougham's he entirely concurred, but in a sense totally different to that which he conveyed: his Lordship said, "that all property was shaken to pieces, and that the time was fast approaching when it should be no more." He (Earl Stanhope) concurred in that sentiment, (not as Lord Brougham meant it, when he said that the times were approaching in which he might become one of the paupers in the county of Westmoreland) but he believed that property had been thus shaken by the measures which Parliament had so erroneously adopted; and from such an impending evil nothing but a union among the agriculturists could deliver the country. (*Cheers.*) When the Poor Law Bill was under discussion the Marquis of Londonderry, in his place in Parliament, told the House of Lords that "if their Lordships passed the bill they would lose their estates, and deserve to do so." (*Cheers.*) Along with the Poor Law Bill the toleration of the introduction of machinery by government had injured the labouring man; and as long as the present currency existed, and as long as free trade existed, the labourer would continue to be robbed by machinery. The political economists said, that the new Poor Law worked well. (*Hear.*) Where did it work well—for whom did it work well? (*Cheers.*) Did it work well in any district—(*loud cries of "Yes, yes," and "No, no"*) where there was a deficiency of employment? (*Hear.*) From his knowledge of the county of Suffolk he could say that the state of the poor there was most appalling; Cambridge was equally so. His friend, the President of the Cambridge Association, when examined before the Com-

mittee of the House of Commons, stated that a district in that county was in such a condition, from the privation of the labourers, induced by the New Poor Laws, that he or any other farmer could in 24 hours put the whole of that district into a state of revolution. (*Hear.*) This bill established for the first time in the history of this country an arbitrary and unconstitutional power; it had established a power that the king did not enjoy; it made, altered, and annulled laws, (*hear*) and handed over to the power of three commissioners all those who were reduced to poverty, and they could give or withhold relief as they thought proper, and in or out of the new prisons. Such an arbitrary, such a despotic and unconstitutional power had never been exercised in this country, and never ought to be allowed in any country. (*Cheers.*) These commissioners were allowed to delegate their power to assistant-commissioners, distributed through the country, ruling the people like so many viceroys, treating them as so many subjects under a Turkish tyrant, and sinking the nation to the level and degradation of a province. (*Long continued cheering.*)

Several gentlemen rose to order, and Lord Wynford was understood to say that he would not have become a member of this society if he had known it was to be open to discussion on the Poor Laws.

EARL STANHOPE resumed. Their (the Society's) proposition stated that the distress of the country fell heavily on a portion of the community, composed of landlords, tenants, and labourers, and if the labourers were effected by the Poor Laws he thought he was entitled to speak upon it. (*Cheers.*) Where, he would ask, did the Poor Law Act work well? (*Cries of, in Suffolk and elsewhere.*) When a reduction of rates took place in consequence of employment it was then said to be the effect of this measure. He knew that in some places where the new law had been introduced the rates had been raised. (*Hear.*) The great increase of rates was to be ascribed to the want of employment; and under the present law, the labourer, if reduced to distress without any fault of his own, could not claim that relief which he (Earl Stanhope) contended he had a right to, and that could not be refused without injustice; and whether idle or industrious, sober or otherwise, he was conveyed to one of the new prisons. (*Hear, hear.*) In the Winslow Union in Buckinghamshire there was an old soldier who was taken prisoner by the French at the battle of Corunna; he was several years in a French prison, and this man said he would prefer such a prison to one of the new workhouses; that the provisions of the prison was preferable to that of the workhouse. (*Hear, hear.*) The country was told that this measure worked well. (*Hear.*) But did it work well in the manufacturing districts? if it had been so beneficial in the agricultural districts, why had it not been introduced into the others? Was it because the member for Birmingham (Mr. Attwood) who was at the head of the political union, said he would not allow it to be introduced among them, and if attempted he would oppose the introduction, whatever means might be taken to enforce it. This new law shook all property to pieces, because it destroyed the property that had hitherto been considered sacred, he meant that the property of every labourer was his labour. (*Hear.*) The bill was a revolutionary bill, and he was anxious that this society should warmly and zealously protect the cause of the Agricultural labourer, and by so doing ensure their forbearance from acts of violence and outrage which no man would more deeply deplore than himself, and which no man would more zealously endeavour to prevent. (*Cheers.*) But if the labourers felt that they had no protection, they might have recourse to that which he would not particularly advert to; but when the day of trial should arrive he should, in the language of his learned friend, say of those who supported the measure, "May God send them a happy deliverance." (*Cheers.*)

These resolutions, having been seconded, were carried.

"That it is indispensably requisite to form a close and cordial union of all the agricultural classes, landlords, tenants, and labourers, for the purpose of pro-

moting their common interests, of defending their just rights, and of ensuring the safety of the country.

"That without such a union it would be impossible for them to obtain that redress to which they are justly entitled, and the adoption of those measures which would prevent national bankruptcy, anarchy, and revolution.

"That it would be utterly impracticable to effect such a union without protecting the rights of industry; for which purpose, as well as from every consideration of justice and humanity, it is necessary to repeal the arbitrary, unconstitutional, and oppressive enactments of the new poor law bill, and to substitute in their place a better system."

The noble earl whilst reading the last of these resolutions was frequently and loudly interrupted by a considerable number of persons, and when his lordship was about to enter into an argument upon the merits of the poor law amendment act and its debasing and degrading effect,

Mr. BRANFILL stepped forward and spoke to order. He said that when he had joined the association he was informed that it was established for the sole purpose of advancing the interests of the agriculturalists, and that all party and political matters were to be entirely excluded. Could he for one instant have imagined that political topics would have been introduced, he certainly should not have become a member. He submitted, therefore, that the noble earl was out of order in pursuing the course of argument he appeared disposed to launch into. (*Loud cheers.*)

Earl STANHOPE was not intending to advance a single observation with regard to the new poor law bill other than was absolutely necessary to show that its workings were most prejudicial to the agricultural interests. In reply to what he had heard from others, that the system worked well, he would ask where had it worked well? He would ask in what district had it worked well? (*Loud cries of "Suffolk, Essex, Hertfordshire, everywhere."*) He would ask also for whom it had worked well? He denied that it had worked well. ("No, no," "yes, yes.") The noble earl was then about proceeding with this line of argument, when

Lord WYNFORD said, in speaking to order, that had he thought it was intended by the society to embark in a discussion upon the merits or demerits, of the poor law amendment act, he never would have enrolled himself as one of its members. (*Great cheering.*)

Earl STANHOPE with some warmth of manner went on to deny that any reduction of the poor rates was in any way to be attributed to the application of the New Poor Law Bill, and to assert, that where any such a diminution of pressure had arisen in agricultural districts, such relief was solely ascribable to the fact of the labourers being more generally employed. The bill was unconstitutional. It was a most revolutionary measure. (*"Hear, hear," and cries of "Yes, yes," and "No, no."*) His lordship concluded by moving the three resolutions, prior to going on with the others.

Mr. BERNARD, in seconding the motion of the noble Earl, was about to launch out into subjects foreign to the object for which the meeting had assembled, when he was called to order by

Lord WYNFORD, and several other members of the society. The noble and learned lord said, that from the instant they permitted themselves to entertain discussions of a political character the society would become an illegal society. (*Hear, hear.*)

The Duke of NEWCASTLE hoped Mr. Bernard would see the propriety of avoiding all questions except those which were immediately and strictly agricultural.

Mr. BERNARD, on again attempting to renew his former intended course of argument, was silenced by cries of "Chair, chair," "Order, order." The hon. gent. at length sat down, after declining, as we understood, to second the motion of the noble earl, in consequence of not being permitted to state the grounds by which he was actuated.

After some further discussion,

Lord WYNFORD moved an amendment upon the resolutions of the noble earl to the effect "That in the opi-

nion of that meeting no further public proceeding should be taken on this subject until the committees of the two Houses of Parliament shall have made their report." In submitting this resolution, his lordship said, that the evidence which had been given before the committee, of which he had the honour of being a member, had furnished an abundant case to entitle the agriculturists to relief (*loud cheers*) and it was his intention to move either a series of resolutions founded thereon, or to introduce a bill upon the subject. (*Hear.*)

Lord DARLINGTON seconded the amendment, which, after some observations from Mr. Spooner, and Mr. Allnutt, was put and carried by a large majority amidst loud cheering.

Earl STANHOPE and two other gentlemen, in consequence of the loss of his motion, then withdrew their names from the list of members, his lordship stating that his exertions and best wishes, although not now a member of the association, would be exerted in favour of the poorer classes of agriculturists.

A vote of thanks was given to his Lordship for his former unwearied and zealous exertions in the cause; and also a vote of thanks to the noble chairman for his impartial conduct in the chair.

## ON HEDGE-BIRDS, WHICH ARE ALLEGED TO BE MORE OR LESS DESTRUCTIVE TO FIELD OR GARDEN CROPS.

(FROM THE QUARTERLY JOURNAL OF AGRICULTURE.)

In making a tour in the north of Ireland, towards the Giant's Causeway, about twenty years ago, the want of hedges struck me as a remarkable characteristic of the face of the country, though it did not, as I afterwards found, appear quite so naked in this respect, as the extended corn-fields of Picardy, or the broad and beautiful holms on the Rhine, through which I have journeyed for days together, without seeing the semblance of a field-hedge, to break the sameness of the level landscape, or afford a resting-place for a flight of sparrows, or a nest-nook for a linnet or a chaffinch. On the Continent, indeed, there are trees in plenty—generally fruit trees—in rows all along the roads, and planted at wide intervals among the corn,

Like giants that in silence stand,  
To sentinel enchanted land;

and in this there is no resemblance to the treeless as well as hedgeless nakedness, that struck me so much on my first visit to Ireland, contrasted with the beautiful woods and fine hawthorn hedges of my native country.

As there are good reasons for forming hedges in Scotland and England, where indeed they become a serious item of agricultural expense, either to the landlord or the tenant, so there are, no doubt, equally or nearly as good reasons for the want of hedges in Ireland and on the Continent. And we ought never to condemn any practice hastily, without knowing all the particulars that led to its adoption,—of which the following is so striking an illustration, as to be well worth repeating. "Many years ago," says the sensible writer, "on looking over a farm in Derbyshire, in company with the occupier, we went to see his plough at work breaking up a piece of lea ground. I at once condemned the farmer's practice of yoking five strong horses *at length*, and told him I thought two

such horses yoked *a-breast* would answer the same purpose. The good-humoured farmer, Englishman-like, did not seem offended by my petulance, but coolly answered, 'They are not horses, they are mares.' I laughed at the distinction, but he explained himself in a very satisfactory manner, and to my great confusion. He said, I have a cheese dairy, and keep a large stock of cows; more than half my farm is in permanent grass for cow pasture and mowing for hay; the remainder is under a regular rotation of arable culture. I keep four working mares, and one to ride and draw occasionally. I might do with fewer at some seasons, but I want so many in seed-time, in hay and corn-harvest, and for working the turnip fallow. Three of the mares you now see are in foal, and I expect to make £70. or £80. of their produce when a year and a half old, and that is about my annual return. The mares are now near their time of foaling, easy work does them good, and they are less liable to injury worked *at length*, than if yoked *a-breast*. Neither is there so much loss of power as you imagine. The hill where they are ploughing is steep, and the lea tough, yet they make a furrow both ways; whereas a pair of horses, yoke them as you will, could only draw down hill, and slide the plough up without one.' I thought the explanation so satisfactory, and the reasoning so sound, that I immediately acknowledged my error, and apologised accordingly. That was a good lesson to me. It taught me to be more careful in future of censuring without investigation.\* On the same principles we should be cautious of blaming our neighbours for not planting hedges.

On the Continent, hedges or fences of any sort are by no means so indispensable as in this country, in consequence of the different mode pursued there of feeding cattle. In the hedgeless districts of France and Germany, there is no grazing,—no feeding of live-stock out of doors,—no meadows covered with sleek well-fed cattle, as in Holland,—all the farmers' live stock being closely confined in stables, out of which they are so rarely seen, that a diligence-tourist might ride hundreds of miles without suspecting the existence of a cow or a sheep in his whole route. In Normandy, indeed, they frequently feed off tares or clover by tethering the cows in shifts; and in Picardy, I have occasionally seen a boy or a girl leading a cow with a rope, to graze by the road-sides, but in Germany never; for the cottager, who may have only one cow, prefers cutting the grass from the road-side or in the woods with a bill-hook, and carrying it home to the byre.

The same system of stall-feeding is pursued in the most extensive concerns, and hence it is rare to see natural grass, except on the hills or in the glades of forests, while there is always, in the arable grounds, considerable breadth of clover or turnips, or both. Between Heidelberg and Carlsruhe I observed, in the autumn of 1832, a uniform and excellent crop of broad-cast turnips, all of course intended for stall-feeding, extending from seven to ten miles along the road, with scarcely a furrow of distinction, much less a hedge or a ditch to serve as a landmark of proprietorship or tenancy. Under such circumstances, consequently, so far as cattle are concerned, hedges or any other fences could be of no use.

The case is different in Ireland, where grazing is practised, but the fences are all turf or stones,

or both, with sometimes a few straggling furze bushes along the coping, though whether these were ever continuous, so as to merit the name of a hedge, appears in most cases to be more than doubtful. These furze bushes, as they commonly appear in the Irish fences, can certainly serve none of the purposes of a hedge, no more than the few feet of nicely clipt hawthorn which a worthy Englishman, the late Rev. Mr. King of Bandon, shewed me in 1819, in his garden, as the only fair specimen of an English hedge in the south of Ireland,—planted indeed by himself, in reminiscence of Old England.

On a market-day at Ballymena (I think it was) in Antrim, I mingled with the farmers to learn something of their modes of management, and amongst other questions, I asked why they had no hedges around their fields, when, together with economical considerations, influenced in most cases by the nature of their tenures, they all agreed in reprobating hedges, which they said were of more advantage to the sparrow than to the farmer. The same notion of hedges affording harbour for birds destructive to corn, is mentioned by the Abbé Rozier\* as prevalent in France; and it is probably more or less diffused in all countries, though for want of precise knowledge, it is often considered a much greater evil than it really is, even where the hedges are, as it should seem, constructed on very purpose to cover an unprofitable breadth of ground with all sorts of briars, brambles, and brushwood, as is but too commonly the case in the vicinity of London, and elsewhere in England.

Looking at hedges, then, in this point of view, it may not be altogether without use or interest, to investigate the nature and the probable extent of the injuries which they may or may not occasion, by harbouring birds of different species. For this purpose, it will be indispensable to distinguish the sorts of birds most usually frequenting hedges, at seasons when crops may receive injury; and, what is of no less importance for understanding the subject, to investigate carefully the sorts of food eaten by each species. It would be as preposterous, indeed, to accuse the wrens and redbreasts about a garden, of feeding on the flowers or the pot-herbs; or the lapwings or cuckoo on a farm, of grubbing up the young wheat or devouring the seed of newly sown barley, merely because they are found there, as it would be to accuse a hare of hunting and worrying sheep, or a fox of stealing the nest-straw of the poultry-house for a similar reason. Yet are accusations equally erroneous very commonly made by farmers and gardeners, very well informed in other respects, but unacquainted with their habits and peculiar food, against the wild birds found in fields and gardens.

An excellent observer, the Rev. W. Bree, has well remarked, that "when any mischief is done in the garden, the orchard, the plantation, or on the farm, we are very apt too hastily to lay the blame on such animals as may happen, in pursuance of their usual habits, to be occupied in or near the spot where the mischief takes place. Frogs and toads have, before now, been accused of eating the strawberries, because they are often met with among the strawberry beds." Proceeding on similar mistaken notions, an orchardist of Pontefract, as we are informed by Major, in 1823, destroyed many lady-birds as injurious to his crops, because he found the crops injured, and the lady-

\* Quart. Journ. of Agricult. v. 36.

\* Cours d' Agriculture, article HAYE.

birds there; whereas it is not difficult to prove that lady-birds never touch any vegetable food, any more than frogs or toads devour strawberries. I had some lady-birds sent me from a distance, two or three years ago, by a gentleman who found them on his peach-trees, and fancied they were eating the leaves, to have my opinion of their destructive propensities!

As our subject naturally divides itself into three parts, inasmuch as birds are decidedly destructive, partially destructive, or not destructive at all, though alleged to be so, it will be convenient to treat of the three kinds separately, beginning with the last, of whose habits and food gardeners and farmers (it is presumed) know much less than they do of the two first.

1. **NON-DESTRUCTIVE HEDGE BIRDS.**—At the outset, it is necessary to remark, that many birds not in the least destructive to the ordinary crops of a farm, often commit considerable depredations in orchards and gardens, nay, the latter so far from being injurious to agricultural crops, may prove of no little service, as we shall afterwards see.

1. *Insectivorous Hedge-Birds, which do not eat Fruits or Seeds.*—The hedge-birds, which live exclusively on insects, and never touch fruits, much less seeds of any kind, are but few in number, and like the larger carnivorous animals, are thinly scattered, with rare exceptions live solitary, and do not assemble in flocks. It will not be requisite to mention each of these birds in systematic order, but I shall advert to the best known and most abundant species.

One of the most exclusively insect-eating birds, not uncommon in most parts of the empire, is the gold-crested wren (*Regulus cristatus*, Ray), the smallest of the birds of Europe, measuring only three inches and a half in length, including the tail, which is an inch and a quarter. It cannot be mistaken for any other bird, being of a greenish-yellow colour, while the common wren is of a rusty brown, with lighter bars and spots; and though the chaffinch and the hay bird are yellowish-green, neither of these has the golden-yellow on the crown of the head, which at once distinguishes this pretty bird. A less conspicuous distinction is formed by two white bars, similar to those of the chaffinch, across the wings, caused by the greenish feathers of the wing coverts being tipped with white.

The gold-crested wren seems to delight most in evergreen shrubs and trees, particularly the spruce fir and cedar, though it is often found where there are few of these, and, even where there are plenty, it never fails to make daily excursions along the hedges in the vicinity, flitting about through the thickest branches, and uttering its small tinkling chirp of *tee, tee, tee*, at every change of its position. It is not in the least afraid of being approached, most probably owing to its being very near-sighted—a peculiarity of vision no doubt designed by Providence for enabling it the more readily to distinguish the minute insects on which it exclusively feeds. It may, indeed, be easily approached near enough to see its colours distinctly, or even to catch it with a fishing-rod tipped with bird-lime. In consequence of its minute size, it is rather impatient of cold; yet it does not appear to migrate, except perhaps very partially, even in Scotland, where it remains during the severest winters, one or more families of the tiny little creatures keeping each other warm in cold frosty nights, by huddling together as closely as possible under the thickest branches of a spruce or silver fir, or of a furze or ivy bush. They are said, however, to migrate from Shetland and the Orkneys. It is not a little singular, that though they stand the

hard frost out of doors, yet exposure to frost kills them when tame, as if the protection of a house rendered them less hardy. They are greatly more abundant in Scotland than in England, and in some districts where fir plantations have been made, they have multiplied prodigiously within my own remembrance.

No farmer, I should think, would be apt to accuse the gold-crested wren of injuring his crops; but when a gardener unacquainted with their habits and food, sees them flitting about among his espaliers, his wall-trees, or his rose-bushes, he will be apt to think they are busy eating the blossom buds, as some other birds are well known to do; while on the contrary, they are doing him essential benefit, by picking up every straggling plant-louse (*Aphis*) and bud-weevil which they can meet with.

The species which come nearest to the gold-crest in appearance and habits, are the wood-wren (*Sylvia sibilatrix*, Bechstein) and the willow-wren or hay-bird (*Sylvia Fitis*, Bechstein), the latter well known in Scotland by the name of the *basket leddy*, given to it from its elegant form and pretty colouring. The chaffinch (*Sylvia loquax*, Herbert), also ranks with these as an insect-eating bird, but is not sufficiently common to merit attention here. The hay-bird is only five inches and a quarter in length, the wood-wren a quarter of an inch more, and the chaffinch nearly half an inch less. All the three are greenish-yellow, darkest on the back and wings, and lightest on the breast and belly,—the young birds being much brighter in colour than the old ones, a circumstance not usual among birds. Some say the chaffinch remains with us all the year,—the other two are certainly birds of passage, arriving late in April, or early in May, and announcing their arrival by their pleasing notes, those of the wood-wren being shrill, short, and hurried, accompanied by a peculiar shaking of the wings,—those of the hay-bird consist of a rather continuous, soft, plaintive warble. The hay-bird uniformly lines its snug little nest with a profusion of loose feathers; the wood-wren on the contrary, never uses feathers, but lines neatly with hair.

The wood-wren is most frequently found among tall trees; and among “hedge-row elms,” as Milton calls them, and other tall trees, in hedges it may occasionally be seen. The hay-bird, again, delights in small copsewood, and in what may well be termed copsewood hedges, so common in England; while it is no less common in shrubberies and gardens, often building in the strawberry-beds, for though it does not seem to care about human neighbourhoods, being found in the most wild and solitary places, it is by no means shy, and will not only allow itself to be approached, almost as near as the gold-crest, but will even make its way into green-houses, and, when the windows are left open, into rooms, where plants are kept in pots.

The chief food of these three species consist of small flies, or small caterpillars, such as roll up the leaves of trees and shrubs, and particularly the rose-leaf roller (*Lozotania rosaria*) or “worm in the bud,” together with the whole of the most destructive species of plant-lice (*Aphides*).\* Where the birds are plentiful, accordingly, they may prove of no little service to the farmer in thinning, on their first appearance, wheat-flies, the blue-dolphins, the hop-flies, and the turnip or the pea-plant lice. This is of great importance, for one of these insects killed at the time of their first appearance, will prevent the breeding of several thousands. After the breeding has proceeded to the second and third generations, our little birds

\* Quart. Journ. Agricult. Sept. 1835, p. 197.

are too few in number, even with their voracious appetites, to keep them down. Yet with all this decided benefit, farmers unacquainted with their exclusively feeding on insects, are but too apt to class them without distinction among "birds," as if all birds fed alike, and were ready and eager to devour whatever crop they might find cultivated in the fields.

Gardeners are even more prejudiced, against the hay-bird in particular, than farmers usually are, and in some parts of England it is opprobriously termed the *cherry-chopper*, from a notion that it devours the cherries. That this bird is very frequently found on cherry-trees, is most true, and, if watched, it may be seen busily picking among the fruit, though, as it never eats fruit of any kind, it does not touch the cherries, but is in pursuit of the destructive cherry plant-louse, a species which is particularly injurious, and which commences its ravages on the cherry-leaves about the end of April, when the hay-bird arrives, as if Providence had ordered the insects to multiply at this season to supply the hay-birds with food. No more does the hay-bird ever taste one of the strawberries in the bed where it may have built its nest, nor the peas in the adjoining kitchen-garden, its bill indeed being too slender to bruise peas, and its gullet too narrow to swallow them unbruised, even were it inclined (as it assuredly is not) to attack them. White of Selborne, therefore, did not manifest his usual accuracy of observation, when he said, that the willow-wrens, meaning the hay-bird and chaff-chaff, are horrid pests in a garden, destroying the peas, cherries, and currants,—an opinion which he no doubt adopted without due examination from the gardeners. Had he ever procured tame ones, as I have had, and tried them, when very hungry, with cherries, currants, and strawberries, and with green peas both raw and boiled, he would have soon had ocular demonstration that they would rather starve than eat fruit or seeds. So far, then, from persecuting and killing these birds, as gardeners so frequently do, every means should be taken to encourage them to breed, by protecting their nests.

Mr. Knapp correctly says of the hay-bird, that "he comes in company with his travelling friends, not as a partaker of their plunder, appearing never to abandon his appetite for insect food: the species may change with the season, but still it is animal: he glides about our rows of peas, peeps under the leaves of fruit-trees for aphides and moths, continuing his harmless pursuit until the cold mornings of Autumn drive him to milder regions."

There is little fear of the nests of the next species to be noticed being taken or destroyed, for the nightingale (*Motacilla luscina*, Linnaeus), conceals her nest so carefully that it is rarely found, even where the birds are most plentiful. Nightingales themselves being usually "in shadiest covert hid," are seldom seen, and many persons spend their whole lives in the midst of hedges and copses where they abound, without knowing their appearance. The cock and hen differ little in size and colour, and are so like the female redstart, that the latter is often sold for a nightingale. Our northern readers who do not know the redstart, may be told, that, except in being a trifle larger, the nightingale is very like a redbreast in form and colour, with the exception of the breast, which instead of being orange is whitish, and the back rather more brown or rusty than the redbreast.

The nightingale is not found in Ireland, in Cornwall, in Devonshire, in North Wales, nor in North Britain, seldom, indeed, farther north than Yorkshire, consequently the Scotch ballad of the Banks of the Dee, beginning

"'Twas summer and softly the breezes were blowing,  
And sweetly the nightingale sang from the tree,"

is in this respect erroneous. In the southern counties, the species abound, arriving in April, and frequenting thickets, hedges, thick brambles, tufted bushes near fields, and even gardens where there are many low flowering shrubs.

It is stated in some books, that besides insects, nightingales will eat berries and currants, but though they may certainly be taught to eat fruit, it is not natural to them, and they will rarely if ever touch it in a wild state, so that however numerous they may be, the gardener may rest assured they will do his crops no injury, while they will do him considerable service by devouring numbers of caterpillars and grubs, as well as the moths, butterflies, and beetles from which these are produced. Even if nightingales should, as we are convinced they do not, purloin a few currants, they repay them well by the loveliness of their song, in which they far excel all the other woodland songsters of Europe, and are only, it is said, surpassed by the mocking-bird of America.

There are three pretty birds termed chats—the whin-chat, the stone-chat, and the wheat ear, which may in some sense be ranked as insectivorous hedge-birds, the stone-chat particularly, which is fond of hedge-rows. This, though the name is similar, is not the bird termed in Scotland the *stone-chacker*, this being the wheat-ear of the English writers. The male stone-chat is readily distinguished by having the head, throat, and tail of a deep black, the breast and belly reddish, while the female is brownish-black, with the throat black and spotted with whitish and reddish marks. The whin-chat, again, is not so gaily coloured, but may be distinguished by its general rust-red colour, and by a white line from the nostrils passing above the eyes as far as the ears. This species frequents cabbage-gardens and turnip-fields after the breeding season, and ought to be protected because it not only eats insects but small shell-snails, while it never touches fruits or seeds. The wheat-ear or stone-chacker (*Saxicola œnanthe*, Bechstein), which frequents corn-fields, building in the little heaps of stones gathered from the land, is equally beneficial in clearing the crops from insects, without levying any contribution for its services.

The wagtails, particularly the yellow one (*Motacilla flava*, Linnaeus), may be observed in corn-fields as frequently as most species, though they are more usually seen running near drains and furrows than about the hedges. The wagtails do not touch fruits nor seeds, and feed wholly on insects, particularly gnats, midges, and other flies that tease cattle, and for the purpose of catching these insects, the wagtails are not afraid to run round cows in the pastures "close up to their noses," as White correctly states, "and under their bellies, availing themselves of the flies that settle on their legs, and probably finding worms and grubs that are roused by the trampling of their feet." Wagtails will, for the same reason, follow the plough to feed upon the worms and grubs turned up in the furrows, and in this way, no doubt, thousands of wire-worms and other destructive vermin are effectually destroyed.

The tree-pippit or titlark (*Anthus arboreus*, Bechstein), is another very common hedge-bird, which lives exclusively on insects. It is not the bird termed the *titling* or *moss cheeper* in Scotland, which is the meadow-pippit (*Anthus pratensis*, Bechstein), but this may also be seen on hedges, on the confines of moors, though it seems to like best to take to the bent or the open heath. These birds much more resemble the wagtails than the larks in their form

and habits, though their colours are similar to the larks. They never hop with both legs like a sparrow, but when they walk or run, put one leg before the other like the wagtails, and like them also they move their tails up and down but not quite so much, — a habit which the sky-larks and wood-larks are not observed to have.

In the autumn, when the pippits are preparing to depart for a warmer climate to winter in, they may be observed to be some times numerous (though they never congregate in flocks) in market-gardens and in cultivated fields, particularly along the southern coast; though in no case do they commit depredations on fruits or seeds, but busily search after the autumnal hatches of caterpillars and grubs, or the smaller flies and beetles which they find among the herbage.

As the titlarks, chats, and wagtails, together with the duncock or hedge-sparrow, are more commonly selected as step-mothers by the cuckoo, who is well ascertained to build no nest, and never hatches her own eggs, it may be proper to mention here, that the cuckoo is exclusively an insect eating hedge-bird. It is so shy and wary that it is not easily approached so as to be distinctly seen while sitting on a hedge or a tree, but it may frequently be seen on the wing, when it so much resembles the kestrel or sparrow-hawk, that the swallows and other small birds appear to mistake it, and buffet it with bill and wing till it again alights, when they leave it alone. Except from the popular saying in Scotland, that the cuckoo becomes hoarse, or ceases her monotonous note when she gets a bere-awn in her throat, I am not aware of this bird being accused of committing depredations on corn crops. The error (if error it be) may have arisen from the cuckoo becoming silent about the season that bere or barley comes into ear and shews its horns. As for the notion of the cuckoo ever feeding on the ears of barley, either green or ripe, it is certainly quite unfounded. Its chief food is the larger caterpillar, such as those of the buff-tip-moth, as well as the moths themselves, and butterflies, dragon-flies, and the like, facts which have been repeatedly verified by opening the stomachs of cuckoos that have been shot. Both the cuckoo and its young being very voracious eaters, so as to be scarcely ever satisfied, the number of destructive insects which they devour must be very great; and hence they ought to be protected by the farmer and gardener, as ranking among their best friends.

The common fly-catcher (*Muscicapa griseola*, Linnaeus) is one of the most decidedly insectivorous of all our hedge-birds. It is nearly the size of the duncock or hedge-sparrow, and not unlike it in colour, being rather lighter, with a few whitish streaks on the plumage. I had one in a cage with a number of other soft-billed birds, but it could never be brought to touch anything but insect or animal food, and uttered the most pitiful cries when a fly or a meal-worm was filched from it by any of the others. The fly-catcher differs considerably in his mode of hunting from several other species which take insects chiefly on the wing. Instead of keeping up a continuous flight like the swallow or the bat, the fly-catcher, like his fellow hedge-hunters the dragon-flies, chooses a station where he can take good observation of all the insects which may venture within his boundaries; generally the top of a gate-post, a stake in the hedge, a dead leafless branch, a tall stick in the middle of a grass plot, the projecting stone of building, or the naked spray of a tree. From such a station he will remain in constant activity the greater part of a summer's day, springing forth, catching a fly in the air, and returning to swallow

it, capturing one moment and resting the next to prepare for another. White of Selborne says it hardly ever touches the ground; but this does not agree with my observation, for I have frequently seen fly-catchers dart down from their watch-post to seize some unlucky caterpillars that had crept into view; and another species, the pied fly-catcher, which I had in a room full of birds not caged, would dart down in a moment on any insect thrown on the floor. It may be as well to mention that the fly-catcher is not the only bird that springs up from a fixed station to take flies on the wing, it being the common practice of the chaffinch, the black redstart, and several other birds; while the nightingale and the red-breast dart down in the way just described to seize insects on the ground.

The flusher or lesser butcher-bird, (*Lanius Colurio*), popularly termed Jack Baker in the south, is larger than a redbreast, but smaller than a thrush, and is readily distinguished by the reddish-brown colour of the back. It is very common in the hedges in some localities, where it builds a neat and large nest. Its chief food consists of beetles and flies, particularly the breeze flies which tease cattle, and even wasps and bees, and hence it may be destructive to hive-bees; but this is the only damage it does to the farmer or gardener, for it never touches fruits or seeds. When it is pinched for insect food, it feeds on field mice, lizards, and small birds, transfixing them as it does humble bees on a thorn, and tearing them to pieces. In houses much infested with flies, a tame flusher is a useful pet, for, leaving it at large in a room, it will soon clear it of the flies, and if a thorn branch be given it to perch upon, it will carry the flies thither and impale them on a thorn before eating them. To these many other hedge-birds might be added, such as the night-jar, the sedge-bird, the wryneck, the creeper, and the bottle-tit, none of which are in the least destructive, while from their feeding exclusively, or nearly so, on insects, they are of much service in diminishing the numbers of such as are injurious to field and garden crops.

2. INSECTIVOROUS HEDGE-BIRDS WHICH PARTIALLY EAT FRUITS OR SEEDS.—The common wren, popularly termed the Kitty wren, or the Jenny wren, is the first bird which I shall notice under the present division. Its diminutive size, and its tail perked up as if it were trying to imitate a well pleased dog, at once distinguish it from every other hedge-bird. Its habits are also somewhat peculiar, for though it flits up and down among the branches of a hedge, it rarely runs up and around the trunk of a tree like the creeper, (*Certhia familiaris*), nor does it usually get so high up as the tits (*Parus*), preferring the root branches and those which hang over water, where gnats and other night-moving aquatic insects lodge in the day time, overshadowed from the light. On these the wren banquets both in summer and winter, and may frequently be seen about hedges, barns, stables, farm-yards, walls, and piles of wood. It is said to eat small berries, such as those of the elder and small seeds, but it is certain that none of these constitute its staple food at any season, and so long as it can find a gnat or a small beetle, it will rarely touch them. From its being a prolific breeder, and the young, though so small, being voracious eaters, the wren must tend greatly to keep down the numbers of several sorts of destructive insects, particularly in gardens and orchards.

The hedge-sparrow or duncock (*Acceator modularis*, Bechstein,) although a much larger bird, is very similar in habits to the wren, and even bears some resemblance to it in its calls, and in the notes of its song. The common name of hedge-sparrow, or dyke-

sparrow is very inappropriate, inasmuch as it has little similarity to the sparrow, except perhaps in its sombre colours, and in its being somewhat omnivorous, as indeed is almost indispensable to all wild birds that have to shift for their food throughout our British winters. The dunnoek, however, is, by the form of its bill, distinctly an insectivorous bird, and any other food which it may be found to eat is rather accidental than otherwise. "When wild," says Dr. Bechstein, "the great varieties of things which serve it for food prevent its ever being at a loss throughout the year. It is equally fond of small insects, and worms, and small seeds. In spring it feeds on flies, caterpillars, grubs, and maggots, which it seeks for in the hedges, bushes, and in the earth. In summer it feeds chiefly on caterpillars; in autumn on seeds of all kinds and elder-berries; and in winter, when the snow has covered all seeds, it has recourse to insects hid in the crevices of walls and trees.\*"

On opening the stomachs of this species which have been accidentally killed, oats have been found along with other seeds; but this was in the winter time when their more natural food is scarce, and I do not believe that it ever eats a single grain of oats from the field in autumn, while insects are plentiful, or while berries may be procured. With respect to its depredations on gardens, these seem to be equally unimportant as its attacks upon oats, for though it would certainly not refuse a bunch of currants, provided there were no abundance of insects, yet it is not by any means a regular visitant in gardens, and prefers to hunt about among hedges and scattered low bushes in fields and commons. In winter it is more common in gardens and when it cannot find gnats or beetles, half benumbed as they then are with the cold, it will look out for the smaller seeds, such as those of pimpinell, speedwell, lychnis, or sweet-williams, which it may chance to find as weeds, or as ungathered in the flower border. The insects which it destroys must, I should think, most amply compensate for the slight loss it may occasion in picking a few chance currants, or a head or two of flower seeds; and therefore, far from it being proper to kill this "sober suited" bird, whose simple but agreeable song is one amongst the earliest indications of the return of spring and fine weather, the gardener would do well to protect it and save its pretty blue eggs from the thoughtless plunder of bird-nesting school-boys. Mr. Knapp is of opinion, that the dunnoek and similar insectivorous birds, when they cannot procure insect-food in winter, feed on the seeds of mosses, such as the hygrometer moss, which abounds both on walls and by the edges of gravel walks; but, if it were so, the birds would sometime or other be observed searching for the capsules, though it is not said this was observed, and certainly has never been remarked by me in a long course of very minute observations of the habits of birds.

Next to the house-sparrow, the redbreast is perhaps the best known and most universally diffused bird in this country, where it abides through the winter, though on the Continent, as well as in the Orkney Islands, it is only a summer visitant like the nightingale or the blackcap in the south, and is seldom seen familiarly about houses, making acquaintance with cottages for the purpose of procuring a few crumbs of bread, when forage becomes scanty and precarious in the "woods and wilds," where it has spent the summer and reared its young. The habits of the redbreast, though so well known to

every peasant, are very frequently misrepresented in books, and hence it is the less to be wondered at, that unfounded prejudice should exist against other species not so common as this universal favourite. It is said, for instance, that the redbreast always betakes itself to the woods in summer, and only comes near villages and farm-houses about the approach of winter. This has arisen from copying foreign observers, who are right so far as continental redbreasts are concerned, but wrong with respect to British redbreasts. "In summer," says Dr. Bechstein, "they must be sought in woods; they return to us about the middle of March, and stop for a fortnight in the hedges, and then proceed to the woods. In October they return towards the bushes which they busily search as they travel and proceed gradually to their destination. Some delay their departure till November, some will even remain here and there throughout the winter, but generally to their cost, as their life is usually sacrificed to these delays. Necessity then forces them to draw near to houses, dung-hills, and stables."

Now, it is evident from these remarks of one of the most accurate and original of the Continental naturalists, that our British redbreasts have very different habits. As there are few or no detached farm-houses in most parts of the Continent, the farmers all congregating into villages or towns, for the sake of society, in peace, and mutual protection during war, it may be thought that the redbreasts are deterred by the multitude of houses from approaching human neighbourhoods, while in Britain they learn sociality by degrees, first about detached cottages and farm-houses, which gradually embolden them to venture into villages and towns, and even into crowded cities, for they may be seen in the Temple gardens and the squares in the very centre of London—a circumstance which must appear not a little surprising to Continental ornithologists. I have little doubt indeed of the fact, though I cannot prove it, that some of them even breed in such places as the Temple Gardens, it being far from true that they all retire to the woods during summer.

Although the redbreast may occasionally purloin a currant from the garden or an elderberry from the fence, it is decidedly an insectivorous bird, as is proved, were it nothing more, by its ungregarious habits. Most animals which feed on vegetable productions, such as the sheep, are social and gregarious, on account of their food, as we shall afterwards see more fully illustrated: but, in the case of animals such as the fox, that feed on live food, which is usually more precarious and less abundant, it would never do to associate in numbers. The redbreast, therefore, is compelled to be unsocial to preserve his existence; for where redbreasts to congregate like house-sparrows, they would soon eat up all the worms and insects around their haunts; whereas one bird may contrive to subsist for months there. Instinctively aware of this, as it should seem, the redbreast will allow no intruder to remain within his chosen haunts without doing fierce battle; and, though such strife for territorial dominion rarely, I believe, proves mortal, it is always sufficiently galling to the defeated bird to make him depart, and to prevent his future inroads.

It would appear from some casual observations, that the redbreast, as well as the blackcap and similar birds, feed their young on a greater proportion of small fruit, when they can procure it, than they care to select for their own eating: for the redbreast has been seen to feed his young almost exclusively on red currants; but as the redbreast is a very early breeder, it is impossible to procure any small fruit,

\* Bechstein's Cage Birds, p. 321.

at least for the first brood, unless privet or bitter-sweet berries be had from the hedges. I once had a caged redbreast, which would eat bitter-sweet berries though no other fruit-eating bird would touch them.

The redstart is by no means so common a bird as the redbreast, which it greatly resembles in feeding, and in some of its habits, while the hen redstart may more readily be taken for a robin without the orange breast, than for a nightingale, as it often is. The cock redstart, however, when in full plumage, that is, during the breeding-season and after moulting, is much greyer in colour, with his white forehead, his deep blue-grey head and back, his black throat, and his shining red tail, rump, and breast. The blue eggs again may be mistaken for those of the dunnoek.

The food of the redstart is so similar to that of the robin, that the same remarks will apply; but it is more a garden bird than the robin, building most usually in the hole of a wall, and feeding its young with such insects or caterpillars as it can find in the bushes. As it eats both elder-berries or currants itself, though by no means so fond of them as it of worms and insects, it is very probable that it may feed its young with these as the redbreast and black-cap are known to do. It can rarely, therefore, do much damage; and, though a few currants may sometimes be purloined, yet there can be little doubt of the redstart always saving many more than it ever consumes, by devouring so great a number of the leaf-rolling caterpillars which so extensively deform and weaken the currant bushes in gardens.

There are several species of very pretty and active little birds termed tits or tit-mice for their peculiar motions, which will most appropriately fall to be considered here. The several species differ in size, in colour, and in a few other peculiarities, but nevertheless have a great similarity in their habits and in their food, and although they are certainly insectivorous, they are also much omnivorous than any of the preceding species. The most distinct of all is the bottle-tit, so called on account of the bottle-like appearance of its nest; but this species not being omnivorous, like the others, and living wholly on insects, I shall pass over with the remark, that nearly all which I have already said on the habits of the gold-crested wren will apply to it, except that the bottle-tit does not seem to frequent the northern parts of the island like the other.

The best known of the species is the tomtit (*Parus coruleus* Lin.), called in Scotland the *blue-whaup*,—a prying, impudent, fearless little fellow, capable of subsisting where almost no other bird could find food, inasmuch as nothing comes amiss to him of an animal or vegetable nature that he can peck into with his small black bill, as hard as horn, and as sharp as a broad awl. With this efficient instrument, he speedily breaks up the hard wing-cases of all sorts of beetles, and the envelopes of chrysalides and pupæ, and will (to get at these), dig into the bark of trees, like the woodpecker, and also into their buds. This, however, so far from being a destructive, is a very salutary habit, for the tom-tit does not, like the bullfinch, eat the buds themselves, but “the worm ‘i the bud’” within, discovered by a similar instinct to that by which the snipe discovers worms beneath the surface of the soil. Were the worm left in the bud, it would to a certainty destroy it by eating out the core, and not only so, but, when arrived at insect maturity, would become the parent of a numerous brood of other worms, each feeding on a bud, and in this way might do very considerable injury. The unwearied activity and perseverance of the tomtits, by

visiting and unworming an incalculable number of wormed-buds, must therefore prove very beneficial in gardens and orchards, destroying so many latent pests that no human penetration could discover. Equally beneficial are the services of this bird in discovering and devouring the pupæ and chrysalides in crevices and chinks of the bark of trees, for nearly all such found in these situations are from caterpillars which have fed on the leaves, and of course would give origin to similar caterpillars, were they permitted to undergo their transformations.

In consequence of their eating animal food, and having harder bills than the redbreast and the dunnoek, the tomtits often procure a meal from the bits of meat or sinew left on bones, though they prefer (when they can get it) any remains of the marrow, and next to that they like suet, and will not refuse lard or a bit of fat bacon. They will even try to loosen the teeth of a sheep’s jaw to see what they can find in the socket; and, for the sake of dainty bits of fat, will venture, with little fear, up to the very door-way of a butcher’s shop.

With respect to vegetable food, they are no less knowing, and prefer what is delicate as well as nutritive, being particularly fond of every sort of nuts and the larger seeds, which most resemble nuts in quality, such as the seeds of sunflower, hemp, peas, and the like. It may well be supposed that their small beak, hard though it be, is inadequate to manage such large seeds in the way they are shelled by the linnet or the bullfinch; but the tomtit is a most dexterous and ingenious seed-breaker. In the case of a pod of Prussian blue peas, for example, he will first peck a hole through the shuck or shaup to get at a pea, and this, when he has procured it, he fixes between his claws, while he hammers away at it with his bill till he gets at the mealy kernel, which he hollows out and devours, leaving the empty shell. He does the same with a hemp seed, and it is surprising to observe how small a hole in the shell will sometimes suffice to enable him to get at the whole contents.

Dr. Bechstein says that the tom-tit eats berries; and, from its omnivorous habits, this is not improbable; but I have never myself observed the fact; and, though I have seen it pecking holes in fallen apples (never in those still on the trees,) I am by no means certain whether this was not for the purpose of getting at some grub whose depredations had caused the fall of the fruit, or to obtain the seeds at the core. Be this as it may, the bird certainly commits very few or trifling depredations on any sort of garden-fruit; and, upon the whole, may be considered as producing more benefit than injury to cultivators; yet from some prejudice against the bird, an exterminating war is carried on against it by parish rewards in some parts of England.

“We still continue here,” says Mr. Knapp, “that very ancient custom of giving parish rewards for the destruction of various creatures included in the denomination of vermin. In former times it may have been found necessary to keep under or reduce the numbers of many predaceous animals, which, in a thickly wooded country, with an inferior population, might have been productive of injury; and we even find parliamentary statutes enacted for this purpose; but now, however, our losses by such means have become a petty grievance; our game-keepers do their part in removing pests of this nature, and the plough and the axe leave little harbour for the few that escape; and thus we war on the smaller races of creation and call them vermin. An item passed in one of our late churchwarden’s accounts was, ‘for seventeen dozen of tomtit’s heads.’ In what evil

hour, or for what crime, this poor little bird could have incurred the anathema of a parish, it is difficult to conjecture. In summer it certainly will regale itself with our garden peas, and shells or pods of marrowfats with great dexterity; but this, we believe, is the extent of its criminality. Yet for this venial indulgence do we proscribe it, rank it with vermin, and set a price upon its head, giving fourpence for the dozen, probably the ancient payment when the goat was a coin. However powerful the stimulus was then, we yet find it a sufficient inducement to our idle bat-fowling boys, to bring baskets of poor toms' heads to our churchwarden's door." These birds are not, however, most usually taken by bat-fowling, but by snares and other contrivances, of none of which the tom-tit is the least afraid. White of Selborne says, that, when a boy, he had known twenty tom-tits caught in a morning, with snap mouse-traps, baited with suet, and I have known considerable numbers taken in Scotland with horse-hair nooses or *girms*, baited with bread or hemp-seed.

There are two other species sufficiently resembling the tom-tit in size and general appearance, to be confounded with it in a boy's basket full of heads taken to the church-wardens, though readily distinguished by naturalists, and even by bird-nesting boys. These are the cole-tit (*Parus ater*) and the marsh-tit (*P. palustris*). Both of these have black heads, while the tom-tit's head is blue. The cole-tit, is also at once readily distinguished by its shining glossy black head and throat from the marsh-tit, with its dull not-shining black-head and chin. The cole-tit besides feeding on the same sorts of food as the tom-tit, though not so omnivorously, is very fond of pine seeds, on which account it most abounds in fir-forests and plantations. During the autumn and winter both of these come into gardens and orchards like the tom-tit, in families or small flocks, but do little or no injury. This is the only species of tit, I believe, which builds in holes on the ground, in preference to holes in trees and walls. The marsh-tit is perhaps more common in this country than the cole-tit, and a family of them may often be seen in the autumn attacking the ripe seeds of a sunflower, which, when they have discovered, they daily visit so long as a single seed remains, holding each seed firmly between their claws till it is neatly unkernelled. They may occasionally taste other seeds, but prefer those of the sunflower to every other, and this, I believe, is the full extent of their depredations.

The greater tit, oxeye, joe-bent, or willow-biter, as it is variously termed, has also a shining black head and breast like the cole-tit, but is readily distinguished from all the others by being nearly a third larger, while it is more gayly coloured with yellow, olive, and blue. The greater size and strength of its bill renders it more capable of digging into the crevices of the bark of trees than any of the preceding, and it is also fonder of climbing up the trunks of trees than the tom-tit, in pursuit of lurking grubs and beetles. In this way it is of essential benefit in orchards and gardens, and ought not to be begrudged a walnut or a filbert in reward for its services, and even were all the roots and seeds reckoned up which these birds may occasionally eat, they would be of such small amount as to be unworthy of consideration.

Having thus given brief sketches, whose general accuracy I can safely vouch for from personal observation, I shall proceed to the next division of our subject in the next number.

J. R.

(To be continued.)

## HOPS.

In the month of August last year we introduced to the knowledge of our readers, the fact that Mr. Crawshay had commenced at Honingham an experiment of sufficient importance to be fairly termed *national*—namely, to ascertain whether in the light soils of Norfolk hops can be cultivated, with an equal success as in those richer lands which have hitherto been considered to be their proper and peculiar habit. Mr. Crawshay planted two acres. We saw them in the above named month, and notwithstanding the drawback of a destroying wind, the bines were of a promise far beyond those of the same period of growth produced in the best old grounds in other counties.

This year he has made a noble plantation of something more than eight acres. It stands on the gently inclined side of a hill, which has been deeply trenched, levelled, manured, and prepared with the greatest care and judgment. It fronts the west, with a point perhaps to the south. The soil is *very* light, but it has, according to the proprietor's grand principle of gardening, been made as permeable as possible to air and water. Both plants and cuttings were put in with a degree of attention accuracy, and ingenuity which belongs only to his uncommon energy of character. Mr. C. has varied his experiment in all possible ways, and has made a register which will enable him to determine many very curious points connected with the growth of this most valuable of all the productions of British agriculture. Two misfortunes incident to the season and the ground have again assailed his infant project. The wire worm attacked the bines in the greatest and most destructive numbers, and the winds and raw air not unconnected with the drought (for what is more perishing than the north, north-east, and north-west winds, which so long prevailed?) aided in their injurious effect. But Mr. Crawshay's frame of mind is one which difficulties only excite; he has persevered resolutely, it is not to be doubted, with every reasonable hope that his constancy will be rewarded by success.

In his last year's plantation the bines have made an astonishing progress, many of them require poles of twenty feet, and they exhibit an exuberance of power by putting forth the supernumerary stems called technically *vipers*, and which the Kent hop growers tear off, and by shooting out laterals also with intense strength. If Mr. C. have committed an error at all, it appears to be in not having given sufficient credit to the powers of vegetation, assisted by the aid of such judicious cultivation, for the growth of the plants has outrun his provision for their support. Twenty-foot poles appear to be in most cases requisite, whereas his do not exceed the height of fourteen. The length of many already exceed their pole from three to six feet.

But Mr. Crawshay is content to watch the progress and meet the difficulties as they arise; he makes the principles of scientific gardening the foundation of his proceedings, and he carefully notes every circumstance connected with his plants of various ages and descriptions. Thus when time shall have allowed him to accumulate a sufficient number of facts, there can be no doubt but he will be able to throw a new and powerful light on the growth of this singularly variable as well as singularly valuable crop.

We have rarely enjoyed more pleasure in any inspection connected with the cultivation of the soil than in going over the hop grounds at Honingham with their enthusiastic and highly informed proprietor. The experiment is, we repeat, a most momentous one for Norfolk, and in no less a degree for the kingdom at large, since there is no crop that, when successfully cultivated, so largely repays the grower, nor is there any in which such vast fluctuation occurs. To ascertain why it is so—whether it depends on soil, season, or situation, whether on manures or on the manner and time of planting, the age of the plant or the subsequent treatment, and how the dangers arising out of these contingencies can be best avoided or the benefits most certainly ensured—these in all their bearings are the objects of Mr. Crawshay's expensive experiment. We can then of our own knowledge specify that thus

far he has proceeded, if not with absolute success, owing to the impediments assigned, yet with sufficient encouragement to ensure him we trust, at no remote distance of time, that superiority in this species of horticulture which he has so eminently attained in others.—*Norwich Mercury*.

## FLAX.

The plants chiefly cultivated in the north of Europe for their fibres for thread, are Flax and Hemp.

More than seventy species of the genus *Linum* are enumerated by botanists. They are of a natural order of plants, the *Linace*, distinguished by the tenacity of their fibres, the mucilage of their seeds, and generally by the beauty of their flowers. The most important of the genus is

### *Linum usitatissimum*—Common Flax.

It is an annual plant, growing with a slender upright stem, branched near the top. The fibres of the bark of this plant have been applied to the making of cloth from the remotest ages.

Being a native plant, it is sufficiently hardy to endure the climate of this and other northern countries. It has, indeed, a wide range of temperature, being cultivated, and for the like purposes, from Egypt almost to the polar circle.

Flax is an exhauster of the soil and farm, and more so when its seeds are permitted to arrive at maturity. When pulled green, its effects are less injurious; in which respect it follows the general law of other cultivated plants. But still, at whatever period reaped, it is thus far an impoverisher of the farm, that its stems yield no return in manure, and that its seeds only do so when consumed upon the farm.

The soils best suited to flax are those which contain a large proportion of vegetable matter. The stiff poor clays, and the inferior soils of a very dry and gravelly nature, are not well suited to it. The best flax soils in England are a few rich alluvial districts, in which it is still largely cultivated, and where it forms a regular part of the course.

In a rotation of crops, the best period for the introduction of flax is soon after the land is broken up from grass. For this reason it may be the first crop taken after grass or clover-lea, in which case the flax is a substitute for a crop of oats in the course. But it is not necessary that flax should be grown immediately on the breaking up of grass-land. It may be sown at any period in the rotation, provided the land is in a fertile state. But in all cases it is to be regarded as an exhausting crop, and not as equivalent to a restorative one; and these principles being attended to, the period of the rotation in which flax should be introduced will be understood.

Should the soil, for example, be suited to the four years' course, the rotation may be—1. Turnips, rape, or other green crop; 2. Barley or wheat; 3. Sown grass; 4. Flax.

Or the order in which the flax is introduced may be changed, and the course may be—1. Turnips, rape, or other green crop; 2. Flax; 3. Sown grasses; 4. Oats, or other corn-crop.

Under the latter course the seeds of the clovers and grasses are sown with the flax, in the same manner as with the cereal grasses; and for this purpose the flax is equally well suited.

Flax may be sown also after a pulse crop; but this is not usually a good preparation for flax, the land being apt to become foul when the flax is preceded by a crop of beans or peas. It is better to make it

succeed either the grasses, or such crops as potatoes, turnips, carrots, beet, or rape.

It is frequent, indeed, to make it succeed to a crop of corn. But this is an erroneous practice, for after a corn-crop, which has already rendered the land foul, a crop of flax tends to aggravate the evil. Sometimes, however, not only does the flax succeed a crop of corn, but it is succeeded by another. This practice is opposed to all the principles of a proper rotation, and should be proscribed wherever the flax-culture is practised in this country.

In warmer countries the flax admits of being sown before winter, but in the north of Europe the proper period of sowing is spring.

When land which is in grass is to be prepared for flax, it is always to be ploughed in the winter quarter, as if it were intended for oats, and as early as convenient, so as to receive the influence of frost to pulverize it before sowing. One ploughing only is required in this case; but the land should be very thoroughly pulverized by harrowing just previous to the seeds being sown.

When flax is sown after potatoes, turnips, carrots, rape, or beet, the land is to be ploughed immediately upon the removal of the crop. One ploughing is in these cases generally held to be sufficient, but the land, previous to the seeds being sown, is to be well harrowed, and rendered quite smooth.

The period of sowing in this country is in the month of April, and in the more northern parts from the middle to the end of April is considered to be sufficiently early.

The universal method of sowing flax is broadcast. It might be sown, indeed, in rows like any kind of corn. But in the case of corn, the object is to produce a large quantity of seeds, whereas in the case of flax the chief object is to produce long stems. And the broadcast system is better calculated to cause the plant to rise with a straight stem than the system of rows, which affords it space to branch out; for it is to be observed, that it is not desirable that the plant should branch; because, when there is a branch, the continuity of the fibre is interrupted, and more refuse is produced. When we are desirous to obtain fine fibre, we must sow thick. When we look for quantity, both of fibre and seeds, we must sow more thin. In the former case, three bushels to the acre may be sown; in the latter, two will be sufficient.

The seeds are sown by the hand in the same manner as corn. Were the flax cultivated in quantity, the broadcast sowing-machine might be substituted. Previous to sowing, the land should, in all cases, be well harrowed and rendered fine, and any stones that may have come to the surface removed. After the seeds are sown, they are to be covered by a double turn of light harrows; and the land is then to be rolled and carefully water-furrowed.

In the culture of flax the changing of the seeds is considered to be beneficial and even necessary, the plant being found to degenerate when produced from seeds frequently sown on the same ground. The principal reason of this appears to be, that the plant is rarely suffered fully to mature its seeds, and its natural habits are counteracted by the closeness with which it is sown. It is from the countries therefore, in which attention is directed to the proper ripening and preparing of the seeds, that we are indebted for our supplies. The best seeds used in this country are supposed to be derived from Holland; but the Dutch themselves obtain their supplies from Livonia, Courland, and other parts of the north of Europe, where due attention is paid to the ripening of the seeds.

When the plants of flax are about four inches high, they are to be carefully weeded by the hand. This is generally done by persons in a sitting or kneeling posture. They advance gradually along the ridges, picking up by the hand every weed that can be observed. The young plants that have been pressed down by the weeders in this operation soon regain their upright position; but yet it is well that the weeding process be not too long delayed, lest the stems of the young plants be broken and injured.

The land, if it has been prepared in a proper manner, will not require more than one thorough weeding of this kind. After weeding, the plants will grow with vigour sufficient to overcome any common weeds that may grow amongst them.

The next process in the culture of the flax is that of reaping. This is done, not by the sickle or scythe, but by pulling the plants up by the roots.

The period of pulling the plant is determined by the principal object in cultivating it. When it is wished to procure fine fibre, the plant should be pulled when somewhat green. When it is wished to procure the seeds either for sowing again or for crushing for oil, the plant must remain until the seeds are ripe. This will be denoted by the hardened state of the seed-vessels, the yellow colour of the stems, and the falling off of the leaves. When flax of good quality, but not extreme fineness, is wanted, the best period of pulling is just when the plant has attained its maturity with respect to the formation, but not to the full ripening, of the seeds. When it is required for the finest fabrics of all, as for cambrics and muslins, it should be pulled when it begins to flower.

When the crop is ready, the plants are pulled up by the roots, and laid in handfuls, alternately crossing each other, and left upon the ground for a few days to wither. They are then freed from the capsules or seed-vessels, and made into small sheaves, which are conveniently tied by a few stems of the plants themselves, or by some rushes or straw-ropes.

The separation of the seed-vessels from the stems is performed by a process termed *ripping*.

The *ripping* machine is an implement like a comb, with iron teeth, fixed upon a plank. Through these teeth the stems are repeatedly drawn by the hand, and thus the capsules or seed-vessels are separated. The ripple is placed in the middle of a large sheet of canvass spread upon the ground. There may be two sets of teeth, fixed on one plank, so that two persons may work at the same time; and the plank may be conveniently fixed in the ground by a pin passed through it. The capsules are preserved, the seeds being either used for sowing, or bruised for oil.

The next process is to separate the fibres from the stem. The common method of doing this is by steeping the whole plant in water. By this means the softer part of the stem partially undergoes the putrefactive fermentation, while the tougher fibres of the bark are not affected. At a certain period then, as ten or twelve days, before the fibrous part of the bark has become affected, the plants are removed from the water and dried. After being dried the stems become brittle, and are easily separated by rubbing or beating from the fibrous part of the bark, which is the only part employed in the manufacture of linen. It will appear that, if the putrefactive process shall proceed too far, the fibrous as well as the more mucilaginous part of the bark may be affected. It is, therefore, a point of practice, to allow the putrefactive process to proceed just the length of affecting the softer part of the stem, without acting upon the fibrous part of the bark. And the usual

manner of performing the process of steeping is the following:

The little sheaves made up after the process of *ripping*, are carried away to a pool or tank, either containing water, or into which water may be conveyed: and in all cases the water ought to be soft.

The sheaves should be built in the pool in a nearly upright position, the heads of them being uppermost. They are then kept under water by stones or heavy substances of any kind, in such a manner as that they shall not rise to a surface. They must not, however, be compressed to the bottom, but merely so loaded as that they shall be kept below water.

The period of steeping to the proper point must be carefully watched. In warm weather eight days will sometimes suffice, in other cases ten or twelve. After the six or seventh day, the state of the flax must be observed from time to time. It is safer to steep it too short a period than ever so little too long. In the first case, merely a little more time is required in the future processes; in the second the strength and texture of the fibres may be injured.

When the flax is found to be sufficiently steeped, it is to be taken from the pool sheaf by sheaf, and laid in heaps near the watering place until the water has drained off. It is then to be carried away to a dry and airy grass plot. Here the sheaves are opened out, and spread thinly and evenly in rows upon the ground, the spreaders working backwards, and causing the but-ends of one row just to touch the tops of the next, so that the whole plot of ground shall be covered with a thin coating of flax.

In this state the flax is allowed to lie for a time, determined by the state of the weather, generally ten or twelve days, and sometimes more.

During the further process of rotting, or *dec-retting* as it is termed, the dissolution of the soft part of the stem is still further promoted, and the whole becomes hard. When it has lain for a sufficient time, which is known by its being brittle when rubbed, and when it is at the time sufficiently dry, it is bound up again into sheaves, but larger than those made before the watering process. It is allowed to remain these sheaves a little time to dry, after which it is led home.

The leading home of the flax terminates the preparation, in so far as the mere grower is concerned. The remaining parts of the operation are properly the province of the manufacturer. But sometimes the manufacture proceeds on the farm itself to the extent of partially separating the fibrous part.

The first process in this case is breaking the stems which is usually done by an instrument called a *break*. This machine consists of three triangular planks, fixed together at both ends. Two triangular planks are fixed to another frame. The two frames are fixed together at one end by a hinge, and work the one into the other.

The upper moveable frame being lifted up, handfuls of flax held in one hand are placed upon the lower frame, while with the other hand the upper frame is made to work upon the flax by repeated strokes. In this manner the flax is bruised, and put into a state to have the ligneous refuse separated from the fibrous part by beating or scutching.

Scutching may be performed either by machinery or by manual labour. When performed by manual labour, handfuls of the flax being suspended by one hand over a plank, are beat by a flat piece of wood held in the other hand. By repeated strokes, the woody refuse of the stem is separated from the fibrous part of the bark. But the operation of scutching is now very generally performed by machinery, the raw material, after being bruised by the break, being sent to the lint-mill for that purpose.

To complete the process, and to get the fibres sorted into lengths, so as to be fitted for spinning, the lint goes to a class of persons whose province it is to give it this final preparation. These are termed hecklers. The heckler operates by means of a set of numerous teeth, placed vertically upon a board. The flax is pulled repeatedly by the hand through these teeth. In this way, and by using heckles of different sets of teeth, the workman sorts the lint into lengths. The refuse after this operation is tow.

The produce of flax varies greatly with the seasons, soil, and management. It may be said to be from thirty to sixty stones per acre, that is after being scutched, and before being combed or heckled.

Besides the produce of the plant in lint, that of its seeds is of considerable importance. The quantity of seeds produced on the acre varies as greatly as that of the produce of the stem. It may be said to be from six to ten or twelve bushels to the acre.

The seed is frequently divided into three sorts; the first sort is reserved for seed, the second for bruising for oil, and the third or refuse is employed at once for the feeding of cattle.

The capsules containing the seeds, we have seen, are separated by the ripple. The ripple is carried to the field, and the operation takes place before the handfuls of the flax are bound into sheaves to be carried to the watering pool.

The capsules are then dried in the sun, during which a number of them will open, and allow the seeds to escape. These are the best and ripest, and may be reserved, if so wished, for sowing.

The remaining seeds are separated from the capsules by a slight heating. The seeds are then carefully sifted and winnowed, and laid in some properly ventilated place, care being taken to turn them from time to time.

The expression of the oil by bruising is a sufficiently simple process, and is done by machines more or less perfect.

The refuse of the seeds may be given to live-stock. They are highly nutritive in every form. They are frequently given boiled to young animals, as calves, and to sick horses and cows. By the process of boiling, a jelly is formed, which all herbivorous animals will eat. It is for this purpose that the refuse of the seeds of the flax, which are not sufficiently good for crushing, is often reserved.

The culture of the flax does not extend in this country, and has generally decreased as improvements in agriculture have advanced. This arises in part from the nature of the plant, the minute care necessary in its culture, and the large supply of extraneous manures which it requires. It arises, however, also in a great degree from the extended commercial relations of England, which enable her to obtain the quantity of the raw material required from countries better fitted to produce it, or where the comparative expense of labour is less. Flax, it has been said, requires a large proportion of vegetable matter in the soil. Sometimes, for this reason, peaty soils will produce it in great abundance; but the best flax-soils are those rich vegetable grounds which exist in new countries, as over all the temperate parts of America, and even in the north of Europe, and chiefly upon the flat margins of rivers enriched by deposits of mud. These are the great flax-soils of the world, and may supply this country with the material, for the uses of the arts, in any quantity that may be required. The best cultivators of flax in Europe are the Flemings, amongst whom the linen manufacture took early root, and who have ever since pursued the culture of flax with diligence and success.—*Low's Agriculture.*

## IMPORTANT TO LABOURERS.

The following is a copy of a letter, just received by J. Compton, Esq., of Urcelfont, near Devizes, from Isaac Romain, late a pauper on Urcelfont parish, who left that village a few weeks ago:—

Bradford, Yorkshire, June 9, 1836.

SIR,—I have taken the liberty to write these few lines to you, hoping to find you well, as it leaves us at present, thank God for it.—Sir, I can tell you with pleasure we are comfortable and doing well at present. As I promised to tell you the truth, I will do it. Sir, I can tell you with pleasure, that we have a good master, and he is taking care of us, and being strangers in the town, he has lent us money to buy us goods with. We are very comfortable up stairs and down; master has put us in a new house of his own, which has two grates with oven and boiler; and the rent of our house is two shillings and sixpence a week: we pay one shilling a week for our goods, which we find no miss of. Sir I will now give you account of myself and children. I am working in the warehouse, I have twelve shillings week now, but I shall soon have fifteen. My eldest daughter is a rover in the mill, she is earning six shillings per week, and she will soon be earning eight and sixpence per week. Jane the next daughter, is a weaver in the mill, she is earning nine and sixpence, and she will soon be earning fifteen shillings per week. My eldest son is a black-waste sorter, at which he is earning four and sixpence a week. The next son is a worsted spinner, he is earning four and sixpence a week. William, my next is a piercer in the mill, he is earning two shillings and sixpence a week. The next two go to school, for which we have twopence a week to pay. We have a night-school for them that go to work, to write and sum, for twopence each a week. We have a Sunday school for them to go to all day, to which master do attend himself. Trade is very brisk in Bradford, and has been for some time, and we hope it will be for years to come. Provision is dear at present, but we thank God we can get plenty. After we left Robert Hale we had upwards of 300 miles to go. We came through locks out of number, and one tunnel two miles long, and one three miles and a quarter: It was six miles over the top, and we were three miles under the hill, and every one was full of fear, but we had a kind Captain who behaved well to us.

Give my best respects to all the gentlemen, and tell them we thank them for proposing so good a matter for me and my family. I do hope that I shall be able by the blessing of God, to bring them up by their own labour. Sir, give my kind respects to Mr. Llewellyn, and receive the same yourself.

I wish Douse's family and Hale's were doing as well as us.

No more at present from your obedient servant,

ISAAC ROMAIN.

N B. The original letter may be seen at the Board-room, at the Work-house, Devizes.

XULOPYROGRAPHIC EXHIBITION.—On Friday, 11th June, a private view of this exhibition took place in Regent-street. About fifteen handsomely-framed engravings on burnt wood were displayed, which, on first looking at them, have all the appearance of highly-finished Sepia drawings. The subjects are taken from well-known pictures, and are executed with great taste, skill, and ingenuity. We were more particularly struck with *Paul Preaching at Athens*, *David and Uriah*, and *La Toilette*, the effect in all of which is quite remarkable. The process by which the very ingenious artist appears to have produced these results seems to be slightly charring some wood of a fine texture and light colour, and then scraping it until the various lights and shades required by the picture are obtained. His labours are highly creditable, and will well repay the trouble of a visit.

The following communication was intended to be read at the last meeting of the Bristol Agricultural Society, but for want of time could not be accomplished:—

### TO THE EDITOR OF THE MARK LANE EXPRESS.

SIR,—I beg to transmit, for your notice, a few observations upon a subject which I think will be of interest, and to which I have been directed by a statement in a Guernsey newspaper. The article has a direct reference to English agriculturists, and, indeed, may serve to give to many of them a profitable hint, although I do not coincide with the author. The subjoined extract with reference to Guernsey, contains sufficient information for our present purpose:—

“The surface of Guernsey may be stated at fifty-four square miles, or, reckoning 640 acres to the square mile, at 15,366 English acres. Deducting one third for rocks, cliffs, and places not susceptible of culture—and for houses, buildings of all sorts, streets, and roads, say, 5,120, there remains, fit for cultivation, 10,240 English acres.

“An island whose surface thus consists of little more than 10,000 acres of orchard, garden, arable and pasture land, cannot be expected to afford a great variety, or any very enlarged system of agriculture. There are, however, circumstances connected with the tenure of property, its extreme sub-division and productiveness, and with the numbers and comforts of the inhabitants, which may suggest useful reflections to the farmer, the political economist, and the statesmen of large countries. The tenure of property partakes of the double nature of land held as a farm, subject to the payment of annual rents, and as land held as freehold in perpetuity. A purchase may be made by the immediate payment of the price agreed upon, or by the payment of a part only, and converting the remainder into corn-rents to be annually paid; or finally, by converting the whole of the price into such rents. In the two last cases, where a part or the whole of the price is stipulated for in annual rents, the purchaser is, to all intents and purposes, as much the proprietor as in the first case, where the whole price is paid down in cash, and so long as the stipulated rents are paid, he and his heirs can never be disturbed, but hold the land as freehold for ever.

“An idea of the sub-division of property may be formed by a reference to the last population returns of 1831, by which there were 1,748 inhabited houses in the nine country parishes and 1,728 in the town parish. As the latter extends in the country a mile south, a mile west, and a mile north, there are more than 250 houses of the town parish that must be set down as belonging to the country, and added to the 1,748 houses of the nine country parishes. Reckoning, therefore, 2,000 houses in the country, and dividing between them the 10,000 acres fit for cultivation, the portion is five English acres, or 12½ Guernsey vergées to each house. This portion is not, of course, equally distributed; instead of five, many houses have only two or three acres attached to them, while some have from twenty to thirty. An English agriculturist will smile at the calling of the latter considerable estates, and on hearing that the exceptions where estates exceed thirty acres are extremely rare. If, indeed, a few do contain fifty to sixty, none beyond can be found. This will not appear surprising if we consider the small extent of the island, and its law of succession. Land cannot, by law, be divided by will. The eldest son takes as his eldership the house, and from sixteen to twenty perches of land adjoining on the paternal or maternal estate, if there be both: he is also at liberty to retain the land in the ring fence; that is, to keep possession of all lands to which he may have access without crossing the public road, but for such parts of lands as exceed his own share, he must pay to his co-heirs the price put upon it by the con-

stable and douzainers of the parish in which the land is situated. With the exception of one part of the land, which is reserved for the sons, and out of which is taken the eldership, the real property is divided, two-thirds among the sons, and one-third among the daughters; but should their relative numbers give an advantage to the daughters if a third were allotted to them, they would be bound to forego that advantage, and to share equally with the brothers.

“The subdivision of the land, and the tenure by which a permanent interest in its cultivation is secured to the occupier, are sufficient to account for its great production. Natural causes come also to its aid, arising from fertility of soil, mildness of climate, and the excellent manure which the sand and sea weed afford; to these natural causes may be added, the excellent roads which, of late years, give so much facility to the procuring of that manure, and the easy access not only to the coast, but to and from every part of the island; and again, the labour and attention rendered necessary by the small quantity of land in each farm, and bestowed on every part of it, contribute largely to an increased production. Thus the tethering of all cattle, the use of the spade, and the general culture of clover, lucern, parsnips, turnips, and mangel wurzel, add wonderfully to the means of sustenance for all animals. In small farms alone, and among the wives and daughters of the occupiers, are to be found the superior care and economy requisite for the successful rearing and feeding of calves, pigs, and poultry, and for the general management of the dairy. The rotation of crops generally observed, gives two crops of wheat in five years; the usual course is parsnips, wheat, barley, clover, and wheat, the greater produce of wheat being after parsnips.

“If we compare the produce of wheat with that of England, we shall find that the average produce of England is stated by Arthur Young, Tull, Cobbett, and the late resolution of several agricultural meetings, at twenty-three or twenty-four Winchester bushels per acre. Mr. Jacob, in his evidence before the House of Commons, reckons it at only twenty-one bushels. In Guernsey the average produce may be reckoned at thirty-three bushels. Mr. Cobbett, in his preface to Tull, says, that on a trial in Hampshire between the broad cast and the drill husbandry the produce was the same both ways, and did not exceed thirty-seven Winchester bushels of wheat per acre, and this was in the best land, in a very favourable year, and with the most careful culture. In Guernsey, Mr. Brock asserts that his neighbour grew in 1832, in a field of exactly two-and-a-half English acres, one hundred and thirty-four and-a-half Winchester bushels, or fifty-four per acre. It is well ascertained, that other farmers, both in Guernsey and Serk, have occasionally grown fifty-five bushels, and one respectable farmer declares that he once grew sixty Winchester bushels per acre.

“Upon the whole, the fertility of the soil and the weight of the crops is undisputed: the superior quality of the cows, the excellence of the meat, milk, butter, and vegetables, is equally so. Let the production of the island be compared to that of any 10,000 acres kept in two or three hands in Great Britain; and the advantage of small farms will be obvious. Compare the surplus produce sent to market with the surplus produce of any 10,000 acres in one, two, or three hands elsewhere, and see on which side the balance will be found. In Guernsey 10,000 acres keep 2,500 milch cows, which produce, one with the other, each five pounds of butter per week; this, at one shilling per pound, or its value in milk, amounts to 32,500*l.*; three quarters of which are sold in town: 550 cows are exported, and about that number of fat cows or oxen slaughtered; and about 500 porkers are either exported or sold to the town. The quantity of vegetables, fruit, poultry, and eggs brought to market is prodigious, and 100,000 bushels of potatoes may be reckoned to be exported or distilled annually. The cider of the island is of the best quality, and from 500 to 1,000 hogsheds are exported in a year.”

“In England we break up the small farms, depopulate the country, and cry up the surplus produce, as if that produce consumed by a vigorous happy race of

yeomen, did not tend to the welfare of the kingdom as much as when carried to large towns to feed a miserable population, living by the precarious returns of manufactures instead of the certain rewards of agriculture. Besides, the main fact upon which the sticklers for large farms rest their argument is absolutely disputed; surplus produce from large farms is not greater than it would be from moderately sized farms. There are larger estates in England than the whole of this island; but where will one be found that produces the same quantity of provisions as is sent by the small farmers of this island to market?"

I must say I do not perceive the propriety of recommending the Guernsey tenure to the English agriculturist, nor that he should mutilate his property by so many subdivisions. It appears to me that by so doing he would erect a barrier to improvement. I am disposed to believe that in 10,000 acres in England, made up of 20 farms of 500 acres each, it will not be found that there is as much capital employed and as much sterling value produced as is equal to the Guernsey 10,000 acres; and I have no doubt you will agree with me in saying, that farms may be found that are capable of it. As to the same number of families being employed, I do not say that 1154 would be required, that are reported to be employed in agriculture in that island; consequently the large farmer appears to have the decided advantage. He could adopt a system which would not only facilitate his progress far beyond the capability of the small farmer, but would also enable him to have the greatest possible produce at the least expense. Would you not say that such a man is the best farmer, and most likely to give employment to the greatest number of labourers, especially if by the aid of machinery he could diminish a few, as he could then afford to employ them in another way more profitably. The advocates for small farms say it is a matter of opinion, now surely, plain matters of fact will go beyond that; nevertheless, it might be a consideration, if it were recommended exclusively, instead of a general principle. I am ready to confess, there is no duty more incumbent on the Government of a country, or from which more advantage might be derived, than that of ascertaining those obstacles to improvement, which are occasioned by the defectiveness of the laws. In England, property held in common cannot be divided, without the unanimous consent of those having an interest in it; and even the Crown, corporate bodies, and the guardians of minors, cannot consent, unless authorized by a special act of the Legislature. Nothing could be more impolitic, or absurd, than retaining such impediments to improvement. Such legal disabilities, to prevent private individuals from consenting to an inclosure, ought to be removed by a general law, and authority given to effect a division, by appointing commissioners for that purpose if approved by a majority in value of the parties interested, and so far we may borrow a hint from our Guernsey friends.

In reference to the subject of farming, there can be no doubt as to a long existing evil on the part of the English farmers, in taking farms too large for their capital, so that, incapable of cultivating it in the most profitable manner, the land or the landlord, or both, are unjustly condemned. I think it, therefore, in the highest degree important that landed proprietors, destitute of ability and inclination to undertake the task for themselves, should employ competent persons to superintend their estates, and see that they are properly farmed. What gives one man any real superiority over another, but the greater knowledge he possesses? What enables some individuals to produce abundant crops, to carry on a prosperous commerce, or any other useful art, but

the acquisition and judicious application of that knowledge in which others are deficient? Let me not, however, be misunderstood, I am far from speaking in terms of disrespect of the English farmer, but merely recommend that which would ultimately be for the mutual advantage of landlord and tenant.

The extent of information in agriculture necessary to bring it to anything like perfection, is far greater than is generally supposed. To preserve the fertility of the soil, to free it from superfluous moisture, to cultivate it to the greatest advantage, to raise its production at the least expense, to procure the best instruments of husbandry, to select the stock likely to be the most profitable, to feed them in the most judicious manner, and to send them to the most advantageous market, to choose the plants best adapted for the soil and climate, and the most likely to become profitable, to secure the harvest even in the most unpropitious seasons, and to perform all the other operations of agriculture in a judicious manner, require an extent and variety of knowledge greater than is usually judged requisite. It is by no means an unfrequent thing to hear the landed proprietors exclaiming against the badness of the times, because his tenant, suffering from the same cause, cannot pay his rent with punctuality, but, in his turn, complains of the scanty produce of his land, which is perhaps, only one-half of what it would be if skilfully managed. Why are there so many poor on the parishes? Whence do all the complaints of agricultural distress arise? Doubtless, there are many reasons. But it is not my purpose to trouble you, sir, beyond a few of the most recent helping causes, as there are committees formed to make the proper enquiry, and if it be possible to discover the true source. I leave this part of the subject in their hands, hoping they will give it that full investigation which may prevent them in any instance mistaking the cause for the effect.

Previous to the report of the Committee on Agricultural Distress coming before the public, there are some letters on the subject, which may in the interim be perused with interest, in "the Farmer's Magazine" for December, 1835, by Chas. Poppy and others. It also contains other interesting matter. It is a magazine which should be seen upon every agricultural board in England, if not in the possession of every farmer, as it is got up with great care, accuracy, and talent.

To return to the subject, if we only take the retrospect of a few years, it is surprising to find the great number of agricultural labourers who, for want of employ, have been thrown upon the parish. This has proceeded from one of two causes, either from the farmer not finding his profit adequate to his expenses, or, his capital being too small to command the requisite labour. If it be the former, and the farmer were disposed to be content with a fair profit, his farm could not have answered his purpose; if the latter, the blame attaches to the farmer, and not to the land; in either case, if a remedy be not applied the consequence must be serious, something like snatching the last resource from the grasp of the drowning man, only, in the present instance, the evil applies not to one, but to a multitude of men.

With this view of the subject, let us suppose that one-half of the cultivated land in England be properly managed; which I think, is as much as can be said; and the other half only producing one moiety of which it is capable, for the want of proper labour being judiciously bestowed upon it; if then the culture of the latter were equal to the former, would there not be nearly as many more agricultural labourers employed? and would

not the produce be considerably greater? And probably, there would be little reason for crying out against a superfluous population at any time. Does not this lead us to the consideration, that we may possibly, after all, produce sufficient corn for our own population; thereby having sufficient resources, of our own, to render Great Britain an independent Kingdom. Besides, no country that has sufficient extent of surface, and can by any exertion produce food for itself, would act wisely, to allow itself to be dependent on others for subsistence. Indeed, as Malthus most justly observes, "Without abundance of agricultural productions, no flourishing towns, no military or naval force, none of the superior arts, none of the finer manufactures, no learning, nor any of those other great improvements of which human society is susceptible, could exist. What exertions then ought not to be made first to obtain, and then to improve a resource, which is not only the surest, and best foundation of national prosperity, but essential to its existence." Our great object, therefore, ought to be, to discover the best mode of increasing the supply at home by means of domestic industry, and not, to depend on the wind and the waves, or the good will of other nations for the means of our subsistence.

It is very important that we should convince our tenantry of the impropriety of grasping at more land than they have capital to compass. Indeed it would be well if some plan of discrimination for them could be devised, as they have not, generally speaking, exercised much for themselves, although there be some creditable exceptions.\* Also it would be of importance, I think, if some public encouragement in agriculture were offered; this subject is rarely sufficiently attended to by statesmen, or by those authors who are distinguished for their ability in writing on political subjects. Reasoning solely from the abuses to which the system of encouragement is liable, they have thence been induced to condemn that policy, and to recommend the plan, of giving to individuals the entire freedom of exercising their industry in their respective pursuits, without any legislative interference whatever. As an eminent agriculturist observes, "It is certainly better to let agriculture alone, than to establish injudicious regulations respecting it. But if a Government will make such inquiries, as may enable it to judge of what can be done with safety and advantage,

and will promote agricultural industry, not only by moving every obstacle to improvement, but by granting positive encouragement, agriculture will advance with rapidity, and will be carried on to an extent which is hardly to be credited, and in a much superior degree than by the "let-alone system," under the torpor of which ages might pass away without accomplishing what might be effected in the course of a few years under a judicious system of encouraging regulations.

If the plans which were in contemplation were successful, that is, if the protection given to agriculture by the corn laws, however imperfect, were abolished, or even materially altered, and if, as would necessarily follow, the farming interest were undone, and "the landed interest actually extinguished," what would become of the manufacturing and commercial classes when their best customers were thus reduced to poverty and ruin? It cannot be doubted that the repeal of the corn laws would eventually prove as ruinous to the trade and manufactures as to the agriculture of the country.

Our markets at present are said to be supplied by five hundred thousand farmers, who are compelled, for the payment of their rents and taxes, to bring their produce to market, and to sell it for a fair profit; but if the good of many millions of people depended in a great measure on a few capitalists, who kept their stores in other countries, inaccessible to our laws, it would be impossible by any means to resist their machinations, to raise the prices to an exorbitant height, and we should be completely in their power.

It was justly remarked by a British Minister (Lord Liverpool) that a nation of ten, fifteen, or twenty millions of people could not depend on foreign countries for the necessaries of life, without the most palpable impolicy and the greatest danger. Another statesman, who was not distinguished for attachment to the agricultural interest (Mr. Huskisson), expressed his apprehension of the hazard of such a dependence in the following emphatic terms:—"If foreigners withheld their corn from us it might only affect their revenue; but the want of corn might inflict on the country the mischiefs of revolution, and might occasion the subversion of the state."

I conceive that the exportation and importation of grain and other agricultural productions, either duty free, or at low rates, in justice and equity, can only take place between nations where the value of money is the same, where they are subject to the same weight of taxation, and are similarly situated in regard to soil and climate, where they live in amity with each other, and are not likely to quarrel.

As to the doctrine that nothing contributes so much to the prosperity and happiness of a country, as "high profits," why should agriculture be an exception to this general rule? When the profits of agriculture were high, as was the case during the last war, the country never was in so prosperous a state, and does it not prove, that successful agriculture is the true basis of national prosperity. Let that doctrine be now acted upon by the legislature, and we shall again become a happy and a prosperous nation.

I am disposed to think that the home market is the most favourable for the sale of manufactured goods; because, when agricultural produce was at a fair and adequate price, the home trade of the country did consequently flourish. Alderman Rothwell well observed in his evidence before the Agricultural Committee, Report, p. 87, "That agriculture ought to be considered the very staple of the country, and

\* A circumstance occurred in connection with a landed proprietor residing in a midland county. He told me himself, that one of his tenants who was a good farmer, but for the want of capital could not manage his farm properly, was consequently always complaining, and behind at rent day. His steward pointed out the necessity of giving him notice to quit, the gentleman felt reluctant to do so at first, but observing that it must ultimately be the case, and at a greater sacrifice to both parties, since the farm would certainly be depreciating in value every year, he was at length induced to give him notice, and told him the reason. The tenant then begged he might have the favour of a good word to his future landlord—yes, was the reply, and not only so, but should a farm become vacant in time, that would come within his calibre, he should have it. The gentleman is a General officer, therefore I think the term calibre a very scientific and comprehensive one. In a little time, a farm half the size was offered him, on which he entered, and is now going on farming it well, and finds it answer his purpose so completely, that he is quite contented.

that protecting duties in favour of agriculture, were for the benefit of trade."

Let the basis of our political system be, "The protection of Agriculture," and every other branch of industry will flourish with it.

I am, Sir, your most obedient servant,  
C. S.

## HORSEMANSHIP.

### RACE RIDING.

The *Stirrup* again:—Who ever saw a jockey ride in long stirrups! There is no such thing in the racing system; for the following reason: because these men are well convinced that short stirrups (I mean compared to the military or the manège stirrup) gives them a firmer seat, more strength, and much greater power to support and assist the horse. A jockey could neither take a proper pull at his horse, lift him, nor set to, with long stirrups.

Those who ride races are persons who are brought up to it from the earliest period of their lives; and it must be admitted that in this kingdom, race riding has attained an extraordinary degree of perfection. The racing position, it is well known, is to stand in the stirrups, the body inclined forward, the hands low; while, in the management of the horse during the race, the rider is guided by the animal's temper, mode of going, and a variety of other circumstances; and the most difficult part of the art of race-riding is, to bring what, in the language of the turf, may be called a *beaten horse home*; that is, to win the race, in the run in, against a superior horse, your own perhaps very much distressed at the moment of the struggle, which of course must be accomplished by superior skill and management; and this is not a very unfrequent occurrence.

The operation of the hands in race riding must be judiciously and skilfully performed. If you yield your hand too much, you abandon your horse; and in pulling him together, if it be overdone, you check and impede him. A steady support must be given, neither more nor less than the horse requires. The horse and the rider depend on each other; the rider's strength should hold out and be equal to with that of the horse.

If the horse goes coolly and steadily, the support from the rider must correspond; but if he be eager and hot, he must be restrained, and the hand must prevent him from exhausting his strength improperly. At the run in the most desperate exertions are called into action; the horse is suffered to extend himself to the utmost, and is assisted by the rider with the pull, the hustle, the whip, the spur, &c. according to the temper of the horse, his mode of going, &c. In regard to the use of the whip and spur, it may be justly observed, that when a horse is at the extent of his speed, the application of either of these must rather retard him than otherwise, since a horse, thus extended, if struck or spurred, will raise his fore feet higher, which must retard his progressive motion. Yet it must be admitted, that the English jockeys, in general, seem to understand very well the precise time to apply these powerful aids; and how often

have I seen two horses, running neck and neck, in all appearance a dead heat, when one single nicely timed stroke of the whip, has caused one of them to extend himself, and his very last stride has given him the race by half a head!

A horse will continue to pull as long as he can; and when he is no longer able to pull, it is manifest that he is completely exhausted.

Those who are anxious to obtain a superior knowledge of race-riding, cannot do better than (after having acquired the art of horsemanship in a general sense) observe the motions and methods of our jockeys. In the first place, they will find them a race of beings diminutive in size, ignorant, as far as relates to intellectual acquirement, but nevertheless, admirably adapted by nature for the profession, and deeply skilled in all its manœuvres and trickeries. Though, generally speaking, they present a great similarity on horseback, yet, on close observation, it will be found, that many of them have peculiarities which sufficiently distinguish them from the rest of their fraternity.

Racing jockeys have a very clean, neat appearance when mounted, particularly those of the South; at Epsom Spring meeting this is strikingly exemplified. It is unfortunate where a jockey happens to be tall, as in the case of Whitehouse, who is five feet seven inches high, and who is compelled to reduce himself so much, in order to come to the required weight, that his strength suffers very materially; and the consequence is, that he frequently becomes exhausted before his horse. Nicholson presents a striking contrast; he is very short in stature, but very compact, presenting a somewhat similar figure to Peirse in his younger days; but he has neither the steadiness of position nor the judgment which distinguished the riding of Peirse. Nicholson is a bold rider, and seldom fails to get a good start. Nelson, the King's jock, is a good fair rider, but cannot lay claim to superiority, nor can he be compared with such men as Robinson, J. Day, H. Edwards, Chifney, Conolly, Pavis, Darling, &c. He is equal (though in a different style) to Johnson, the successful rider of Dr. Syntax; and a shade superior to Arthur, Templeman, and a long list of those who may be placed in the middling class; men who, if they happen to be put on the best horse, may manage to win.

I noticed two or three times, during the year 1831, the riding of a man, named Jacques, who, though but little known as a jock, appeared to me to ride remarkably well.

No person can become a regular public jockey, who does not commence the business very early in life. He must not be allowed to attain the ordinary bulk of human nature, or his weight forms an insuperable bar to his riding on the course; he must, by sweating and physic, keep himself within a certain weight—he must oppose the progress of nature, and thus qualify himself for the profession.

There is another class of riders who appear on the race course in what are called Cock-tail stakes, Welter stakes, &c. There are but few gentlemen who exhibit in this way, that appear to advantage; their performances prove, that a man to excel as a rider on the race course, must make the subject the

business of his life. The action of race horses is smooth and pleasant; but if a man, a fair rider on the road, mount a racer on the course, and put him to a good rate, he would most likely become unable to see, turn giddy, and would fall.

In the foremost rank or what may be called *Gentlemen Jockeys* may be placed Mr. Kent and Mr. White; but these gentlemen, particularly the former, have devoted much more than ordinary attention to it: indeed, it may be justly remarked that Mr. Kent has made it a sort of regular profession. I think him the best gentleman jockey that I have seen. Mr. Kent is a finished rider; and the same observation will apply, in a great degree, to Mr. White. Lord Wilton rides well; and the same may be said of a few others; yet the generality of gentlemen jockeys make but an indifferent figure on the race course.

#### RIDING A TROTTING RACE.

The general method of riding a trotting race is to sit down as close to the saddle as possible, pressing your thighs and knees to the horse, your body inclined a little backward, your legs forward, your position as still as possible. The stirrup the usual length, the foot either home in it or the ball of the foot pressing upon it—I prefer the foot home in all riding. By thus placing yourself on the back of a trotter, it is supposed that you are better enabled to bring out his best speed, than if you rose in the stirrups; of which, however, I am doubtful; and in fact, the position just described has arisen from the motion of extraordinary fast trotting horses. The best pace of a fast trotter is a sort of run, and the action which thence results is better met by the close firm seat than by rising in the stirrups; or, in other words, the close seat will be found to correspond much better with the action, and is consequently easier for both horse and rider, than when the system of rising in the stirrup is adopted. But if the horse trot boldly out, I am decidedly of opinion, that to rise, inasmuch as it corresponds exactly with the action of the horse, is therefore calculated to produce his best pace in trotting. Hence it results that the close seat is the best calculated for runners; to the bold fair trotter it is not applicable; and as the runners are generally employed in trotting races and matches, I think we may easily perceive whence arose the notion expressed at the commencement of this article.

The celebrated American trotters, whose appearance in this country must be fresh in the recollection of every person, astonished all those who were fond of or paid attention to trotters; I confess when I first saw one of them (*Rattler*) go, I was immediately convinced that I had never witnessed anything like it. I was abundantly satisfied no horse in this country could go with him. Nor, if we consider the subject, was such a circumstance likely:—these American trotters had been trained to trotting from the moment they were first handled; they were constantly used to it, and never allowed to gallop; in consequence they had no idea of galloping; and however they might be aided, animated and pressed forward, they could not be induced to break. The horses of these kingdoms, being accustomed to various paces, are no sooner pressed in the trot beyond a certain

point, than they strike into the gallop. And after all, these American horses rather ran than trotted; and this indeed must be the case with all horses whose speed in trotting is increased much beyond the ordinary degree; which is clearly proved by its requiring a very different correspondence in the rider.

In riding a trotting race or match, the temper, trim, and habits of the horse ought to be previously known to the rider, and he should act accordingly; a man will ride a trotter to more advantage after he has been a little used to him. The hands should be held low, the horse encouraged to extend himself to the utmost, and the judgment of the rider must be exercised so as to be aware when he is upon the point of over-rating himself, and thus cause him to gallop:—the horse should trot as fast as he possibly can, but never strike into the gallop. This requires skill. If you perceive he is on the point of galloping, increase your pull, but keep your hands down: if you raise your hands to increase your power, you will cause the horse to gallop: keep your legs steady, and do not press them to his sides. A horse is liable to gallop at times, when he is by no means at speed in the trot; when, for instance, his haunches are too much under him, and his eagerness to get on will not allow the haunches to slacken that the shoulders may take the lead. The generality of trotters, when they settle themselves, take a steady support, which must be allowed them, keeping the hands low, steady, and firm. The horse will occasionally refresh his mouth, by yielding his nose or rearing his head, and then take a support again; he should be allowed whatever is accommodating to him, so that it has no tendency to make him gallop or slacken his trot. All the operations of the hand must be low to keep the horse down.

I cannot say that I admire battering a horse's feet to pieces in a trotting match over miles of hard road. Why not let the horse perform upon turf?

The third anniversary of the Downham Division of the West Norfolk Agricultural Association was held May 21st, at the Crown Inn, Downham. Wm. Bragge Esq., of Stradsett, President. The Society's premiums were contested for by 58 candidates, 18 were labourers, whose united ages amounted to 977 years, average 54 years each; their servitude 486 years, average 27 years each; their children 161 years, average 9 years each. The first premium of 3*l* was awarded to Wm. Trundle, father of eleven children, for a servitude of 30 years upon the same farm; the second premium of 3*l* to R. Sutterby, 10 children, and 31 years servitude; the third premium of 2*l* to E. Neville, 8 children and 30 years servitude; the fourth premium of 2*l* to Breton Kettingham, 11 children and 30 years servitude. The above candidates have never received parochial relief, and have invariably paid their own rents. Seventeen team-men, whose united servitude amounted to 298 years, average 17 years; nine were shepherds, in the care of 2773 ewes, average 306 each; number of lambs 3620, 27 to the score; ewes lost 55, not one in 50. The single women averaged a servitude of seven years each. Premiums were awarded to female servants of 21 years of age, to widows, and to unmarried men servants. There was little or no contest for the cattle sweepstakes, but from the subscriptions already entered into, a large show is anticipated at the next anniversary.

## NEURALGIA OF THE FEMORO-POP- LITEAL NERVE (DISLOCATION OF THE PATELLA?) IN THE HORSE.

By M. DUBUISSON, Château Thierry.

*From the Veterinarian.*

Notwithstanding the rapid progress which veterinary medicine has lately made, it is far behind that which appertains to man. The observations which have yet been recorded respecting the diseases of our domestic animals are too few in number to enable us to state with certainty their resemblance to, or difference from, kindred affections in the human subject. This is especially true with regard to the neuroses in general, and the neuralgic in particular; a class of maladies as yet imperfectly known in human medicine, and the existence of which is problematical in the quadruped.

I am not able to throw much light on the neuralgic, which certainly rarely attack the quadruped, and never endanger his life: such a task is undoubtedly beset with difficulties, and can only be undertaken after long experience and careful observation; but I will relate two cases in which I think that I have seen it in the horse.

CASE I.—An entire draught-horse, five years old. A sudden cold succeeded to a great deal of rain. The disease appeared in both hind limbs at the same time, and was accompanied by the following symptoms:—The animal remained standing—the two fore legs were wider apart from each other than in the natural way of standing, while the hind limbs, placed far more backward than usual, could not be in the least degree moved forward. This fixedness of position did not last long. It was frequently interrupted by great agitation of the whole body, and by convulsive contractions, more or less prolonged, of the femoral muscles. One symptom was contraction of the digital portion of the leg to such a degree, that the weight was supported by the anterior portion of the fetlock. In this last position of the hind legs the hocks were stiffened, and the body was carried so far forward, that it seemed almost incredible that there should not be a luxation of the articulations: and such was the peculiar appearance of the horse, that he seemed as if he were pinned to the ground by these two hind limbs. This extraordinary position, however, was continually changing, and then he found great difficulty in regaining his natural position, and seemed to suffer extreme pain, his hind limbs being in one continual convulsive motion, and almost depriving the animal of the power of bringing them forward: indeed, at last, he could only effect this by means of the spinal and croupal muscles, which did not appear, like those of the popliteal region, to be withdrawn from the influence of the nerves of voluntary motion. In order to bring himself back to his natural position, he threw as much as possible of his weight on his fore legs, lowered his head, curved his spine, and then, by certain muscular efforts, dragged his hind legs forward. Many a time I have seen the proprietor of this horse take the hind legs, one after another, and bring them forward, surmounting with some difficulty the convulsive contraction of the muscles, and thus place the animal in his natural position. After this, the pains ceased.

In every paroxysm the greater part of these symptoms returned, and presented the same degree of intensity at the commencement as at the end of the fit. The convulsions returned whenever the horse was teased, and especially when he was forced to move his hind limbs forward. During the remission

he had all his usual gaiety, fed well, and did not appear to suffer any considerable pain:—the pulse was natural, and there was no other deviation from a state of perfect health, than the inability of bringing one of the hind limbs before the other.

All these symptoms disappeared from both legs at once, at the expiration of about forty-eight hours, and it returned sixteen days afterwards, when, as in the first instance, a cold temperature of the air followed considerable rain. This new attack did not last long.

My treatment consisted of a mash diet, the internal administration of small doses of spirit of turpentine, and of embrocations with an opiate liniment over the whole extent of the limb. I meant to have applied other means, had a third attack occurred; but a twelvemonth passed, and the horse continued well.

As to the cause of this affection I have little to say. The owner had purchased the horse only eight days before the first attack; and I cannot tell in what state he was before the sale, nor whether the causes of it dated their existence before or after this period.

The change of locality might have had some influence in the production of it; it was probably the principal cause, for all traces of disease disappeared at the end of a month. To this, perhaps, may be added the equally powerful influence of the hard work and high keep which he had experienced with his new master. As to the treatment employed, it could have very little influence in removing the complaint.

CASE II.—This also was an entire horse, twelve or fourteen years old. As in the former case, the disease was preceded by cold and wet weather: the symptoms were the same, except that they were not so violent, nor of so long duration. When he was quiet, the animal did not appear to suffer, and ate and drank well: it was only when he moved his hind limbs in the act of progression that the pains and convulsive contractions were perceived.

If, however, the neuralgia was not so intense as in the preceding subject, it lasted longer; for it was not until the tenth day that it began to disappear suddenly in one leg, and in consequence perhaps of the weather suddenly becoming warmer, or spirit of turpentine having been given internally, and the cauterizing having been applied to the coxo-femoral portion of each limb. On the following day the spasms left the other leg, and the horse returned to his work. During the whole of the attack there was not any evacuation of urine, but, as soon as the animal began to get better, it was voided in great quantities.

The cause of this last attack probably was some excessive fatigue which the horse had experienced, and the being exposed to cold when covered with sweat, and the custom of many cabriolet proprietors (and this horse belonged to one of them) to turn out their horses into the wood during night.

If I propose to designate this affection by the name of femoro-popliteal neuralgia, it is because I think that its seat is the great femoro-popliteal nerve (the great sciatic of some French anatomists, perhaps here the nervous popliteus, or internal and larger division of the sciatic nerve,) and, perhaps, also the smaller (external) popliteal. I confess, however, that I cannot base my theory on the symptoms which I have described; and I do not deny that that theory is manifestly incomplete which is not supported by facts of pathological anatomy: nevertheless, if it be evident that the muscles which undergo these unusual spasmodic contractions are those on which the

femoro-popliteal nerves are distributed, it is not illogical to account for these spasms by supposing them to indicate a morbid affection of these nerves. As to the question which of these nerves is chiefly, or, perhaps, alone affected, I should say that it is the great femoro-popliteal, which sends branches to the extensors of the hock and flexors of the foot. If the other nerve had been similarly affected, there would have been powerful contraction of the pre-tibial, and the posterior femoral muscles, and the hock would not have been so extended, nor the foot so flexed.

*Réc. de Méd. Vét., April 1836.*

[These are plainly cases of dislocation of the patella. The projection backwards of the hind leg, and the flexion of the pasterns, and the sudden disappearance of the lameness, sufficiently mark it. There can be little doubt, that if the stifle had been examined, a slight projection would have been found on the inside or out side of it, and probably on the latter. The method of reducing the dislocation is well known to every practitioner. Even a lash of the whip, although it may be a somewhat unsurgical and perhaps dangerous application, has often wrought a sudden and effectual cure. In case of relapse, a blister round the stifle will prevent a repetition of that.—Have any of our readers seen a case of veritable or probable neuralgia in the quadruped? It would be satisfactory to clear up certain points of pathology as we proceed; and we would earnestly entreat the co-operation of our brethren for this purpose.—Y.]

## EAST SUSSEX ASSOCIATION,

FOR THE IMPROVEMENT OF THE LABOURERS' CONDITION,  
AND THE ENCOURAGEMENT OF AGRICULTURE. SHEEP-SHEARING FOR PREMIUMS.

The trial of skill in sheep-shearing for premiums, given by the East Sussex Agricultural Society, took place on Friday, June 3rd., at Firle. By the kindness of Lord Gage, a picturesque spot in the Park was appropriated to the meeting. Twenty-five pens (one for each competitor) had been fixed in the green sward, enclosing an area of considerable extent, where the shearers were to perform their work. The candidates having completed their allotted task of shearing eight sheep each, the judges, Messrs. T. Edlman, Henry Rogers, and Farncombe, proceeded to inspect the work, and the company immediately afterwards repaired to the booth, and upwards of 60 persons sat down to an inviting repast.

The Earl of Chichester took the chair, and Mr. Putland officiated as vice-president. The cloth having been removed,

The CHAIRMAN said that before he proposed the usual loyal toasts, he thought it would be better to call in the competitors and distribute the prizes, as the men would then have an opportunity of drinking the King's health with the company. His lordship then explained the resolution under which the awards were to be given. It had been decided by the society that a sum should be given in premiums to the best shearers, whose work should be performed in the neatest and most workman-like manner, with the least injury to the sheep. Providing the work was well executed, the time also to be taken into consideration. And no candidate was to be admitted without a certificate of good character.

The men were then called in, and his lordship distributed the prizes as follows:—

CLASS 1.—The first premium 3*l* to Hugh Simmons, Jun., of Falmer. The 2*d*, 2*l* to Joseph Upton of South Malling. The 3*d*, 1*l* to John Oliver, of Firle.

CLASS 2.—Those under 24 years of age, who had not shorn in a company more than three years. The 1st premium of 2*l* to William Walder of Shermanbury. The 2*d* of 1*l* to R. Levett, Jun., of Berwick. And the 3*d* of 10*s* to Edward Carter, of Falmer.

A premium of 1*l* to Hugh Simmons, Senr., as the Captain of the company to which the best shearer belonged. To Richard Levett, Senr., the Captain of the second best was awarded 10*s*. And Hugh Simmons as Captain of the third best, a further premium of 10*s*.

On the recommendation of the Judges, 10*s* were presented to Gregory Gladman; and 5*s* to James Dodman, two unsuccessful candidates, who had sheared their sheep in a very workmanlike style.

His LORDSHIP then alluded to the objects of the society, and its present prospects. He said, that as President of the society he had received a communication from his Majesty, who had last year expressed the interest he took in the society, and desired to become a member, but deferred doing so until the new rules and regulations should have been made. In reply to a communication from him (Lord Chichester,) containing those rules and a copy of their report, His Majesty had, through Sir Herbert Taylor, transmitted the following letter:—

“ My dear Lord, “ Brighton, Jan. 3., 1886.

“ I have had the honour to receive and submit to the King your lordship's letter of the 26th ult. and the accompanying report and account of the proceedings of the Sussex Association, and I have received his Majesty's commands to thank you for this very satisfactory communication. His Majesty orders me to assure your lordship of his entire approbation of the report and of the proposed rules, as of his ready acquiescence in the wish of the committee to notify in their future advertisements that he has become patron of the institution.

“ His Majesty considers its purposes and provisions highly important, as being calculated to promote the agricultural interests of this county, and to encourage the adoption of a similar course in other parts of the kingdom. He deems the maintenance of those interests and the welfare and comfort of the valuable labouring class of his subjects to be essential features of the prosperity of this country, and justly the object of his Majesty's solicitude and of general attention; and he therefore rejoices in the opportunity which the Sussex Association have afforded to him of giving his countenance to their praiseworthy and useful exertions, the success of which must be an object of his Majesty's peculiar interest, from the circumstance of his residing in this county during a considerable portion of the year.

His Majesty directs me to add that he will subscribe 20*l* annually towards the objects of this institution, and that Sir Hy. Wheatley will receive instructions to pay that sum to your lordship immediately and every January.”

“ I have the honour to be,

My dear Lord, yours very sincerely,  
“ Rt. Hon., Earl of Chichester.” H. TAYLOR.”

He was quite sure that those who knew the goodness and kindness of his Majesty's heart, and the interest he took in agricultural affairs, not only because it was his duty as King of this country so to do, but also because he had for years been himself a practical agriculturist, would be anxious that men who had not the same opportunity as themselves of knowing what was going on, should be made acquainted with the anxiety which was manifested for the welfare of that class to which they belonged, and the

fact that it was in the industry, the honesty, and the morality of the more numerous classes that the prosperity of this country would alone be found; and he trusted that the expressions which they had now heard of his Majesty's intention to promote the industry, and consequently the comfort and happiness of the labouring class, would stimulate them to fresh exertions, which would tend to redeem that character which, though not in the individual instances of those he was addressing, had been, he regretted, in many cases lost. There were many among them who he knew did honour to their station, and to the happy constitution under which they lived; and he hoped that the rewards he had now distributed would incite them to future industry, and the further exercise of the skill which they had that day manifested. (*Cheers.*)

The **Healths of the King and Queen** were then drunk amidst loud applause.

The **CHAIRMAN** then informed the company of the business that had been transacted at a meeting held that morning. A rule had been decided on, that the premiums to be given to labourers for the best cultivated gardens, should be under the control of local associations; and conformably to that regulation several applications had been made to the central society, and they had agreed thereupon to award the following sums:—to Ditchling, £3; Hamsey, £3; Stanmer, Falmer, Kingstone, and Iford, £6; and Hurstperpoint, £3. The finances, he was happy to observe, were in a very flourishing state, and he only regretted that the operation of the society was not further extended. It appeared that the balance in hand was £185 9s., and with subscriptions uncollected, £188 9s.; from which, after deducting the shearing premiums 11l. 5s.; the ploughing prizes, 15l.; the branch societies, 15l.; premiums of last year (if claimed) 70l.; and incidental expenses; a surplus would be left of 70l. at least. The noble lord then alluded to the great good which appeared to have been effected by the local associations, and expressed a hope that many similar institutions would be formed in connection with the central society.

The **Healths of the Lord Lieutenant the Duke of Richmond, and Lord Egremont** were each drunk with universal applause.

**Mr. PUTLAND** proposed the health of the noble chairman, which was drunk with three times three hearty cheers.

The **CHAIRMAN** in returning thanks observed that although he was not a practical agriculturist it gave him on all occasions the greatest gratification and delight to meet those whose interest and profession were connected with agriculture, not only to co-operate in all that was likely to benefit the agricultural interest generally, but to promote also the welfare and the happiness of the labouring class—(*cheers*). He thanked them for this kind expression of their sentiments towards him, but he must say that, if there were merit in any of the plans which he might have suggested he was much indebted to the assistance of his friends in their formation, and he, indeed, trusted that the bonds of that mutual friendship might yet be drawn closer and closer together. His lordship concluded by proposing the health of Lord Gage, whose unavoidable absence he regretted. He need not appeal to every tenant present to affirm the upright and liberal character of his noble friend—on the poor he need not call to bear testimony to that kindness and humanity which belonged perhaps more to Lord Gage than to any other nobleman whom he knew.

The health of the judges was then drunk, and **Mr. Tbos. Ellman** briefly returned thanks, and proposed

the health of the Stewards, Messrs. John Ellman and Putland.

**Mr. JOHN ELLMAN** returned thanks. He remarked on the inferior style of sheep-shearing which had formerly prevailed in this county, and the gradual advancement which had taken place in the art, and expressed a hope that a spirit of emulation would be awakened and a perceptible improvement take place every year, fostered by this society—supported as it was by the Noble Chairman, whose strenuous exertions in behalf of the agricultural interest reflected credit on the country in which he lived.

The **CHAIRMAN** proposed the health of "Captain" Simmons and the successful candidates, stating that the former was one of his tenants, and a hard working industrious man: and he might here remark that it was only by encouraging industrious and moral habits in the labouring class that they could look for that relief to the agricultural interest which they in vain hoped to obtain elsewhere—(hear hear). He did not wish to indulge in any gloomy forebodings, but for his own part he did not think they were justified in hoping for any relief from legislative enactments. They were too apt to look to the legislature for relief, and to forget the moral of that ancient fable of the waggoner, who, when his wain had stuck fast in the mire, stood bawling to Jupiter for assistance when he should have put his own shoulder to the wheel. In his opinion their prosperity would be in proportion to the encouragement given to the industry of the labourer, and the advancement made in an improved system of agriculture, by promoting among other means such institutions as this. He felt pleasure in proposing the health of one who had for years in his sphere put his shoulder to the wheel most manfully.

His Lordship shortly afterwards left the chair, and the company after enjoying a convivial evening, departed highly gratified with the proceedings of the day.

**PLOUGHING BY STEAM.**—Some experiments were tried on Friday week at Red Moss, near Bolton, Lancashire, in the presence of Mr. Handley, M. P. for Lincolnshire, Mr. Chapman, M. P. for Westmeath, Mr. Smith, of Dcanston, and other gentlemen interested in agriculture, with a new and very powerful steam-plough, constructed by Mr. Heathcote, M. P. for Tiverton. About six acres of raw moss were turned up in a few hours, and turned up in the most extraordinary style, sods eighteen inches in breadth and nine inches in thickness being cut from the furrow, and completely reversed in position, the upper surface being placed exactly where the lower surface had been before. The possibility of ploughing by steam has thus been established, though, as the employment of the steam plough in preference to one drawn by horses will depend on the comparative cost of the two powers, and on that of the implements used, and as there are not at present any sufficient data for judging what the difference of the cost will be, it is not possible to say how far steam is likely to be applied to this department of agriculture. The plough of Mr. Heathcote, though a very powerful machine, appears much too complex and costly for common agricultural purposes, though we have little doubt that it might be used not only with effect, but advantage, in reclaiming large portions of moss land—such, for instance, as the bogs of Ireland. Indeed, it is the opinion of Mr. Heathcote himself, that it would not at present answer to employ it in reclaiming a smaller portion of bog than 1500 or 2000 acres, though it may probably be cheapened and simplified, so as to make it ultimately useful on a smaller scale.

**Mr. Ellman**, in his evidence before the Agricultural Committee, says the New Poor Law has been the salvation of the county of Sussex.

## AGRICULTURAL SOCIETIES No. 2.

TO THE EDITOR OF THE YORK CHRONICLE.

SIR,—The greatest impediments to agricultural improvements are;—a want of easy and rapid communication throughout the widely scattered ramifications of that body, and an apathy in the individuals composing it, to seek the information,—necessary and practical, respecting the principles of their profession. There must be some attractive nucleus to effect the former;—some gentle, well regulated, and patient inducement to the formation of habits; reading, and enquiry, as well as communicating intelligence in an eligible form, to secure the latter. The object is sure to be defeated, if we endeavour to force intelligence upon them, or give them too much of it at one time. We have heard it spoken to the disparagement of the smaller farmers, that it is owing to the large farmers that all the improvements of agriculture have taken place. This however is well known to be erroneous;—it is either noblemen, or chemists, or persons who have more means and leisure than the large farmers, who have experimented, and to whom all our improvements are owing, as Lord Somerville, Lord Western, Lord Althorpe, Sir John Sinclair, Sir H. Davy, and Dr. Lettsom. Why should the smaller farmers be unfavourable to agricultural improvements? cannot they as effectually try an acre of *chevalier* or, *annat barley*,—the *trifolium incarnatum*, or the *pou venosa*; *bone manure* or *animalized carbon*, as fifty, and do it in a much more careful and scientific manner, than the too much occupied large farmer?

The means for accomplishing the greatest advancement of practical and scientific agricultural knowledge, are by agricultural libraries;—lectures, and prize and other essays. Some landowners adopt the almost useless method of purchasing a number of agricultural periodicals, and circulate them amongst their tenantry, which are generally thrown to a side, and we hear complaints that they cannot be induced to read them. Whence arises this? They are given to them, and from the hands of persons whom they consider as ignorant of all good farming. If instead of this, a few land-owners would establish a small library;—first of periodicals, and, then of standard works, and sell the tickets at a very small sum, not more than five shillings, or two and sixpence will be better, they might be *tempted to read*, as they value most what they pay for, but will not lay out much until the desire for knowledge is excited. A few gentlemen might subscribe a sovereign each per annum, and introduce nothing but works purely agricultural, and by constant additions of works and readers, it might become generally and really valuable. I would press this most earnestly upon the attention of landowners. I next would recommend lectures,—not as a commencing, but an advanced step. I am no friend to the odious and detestable “march of intellect,” or the rabid and infidel manners so deemed by this depraved and perverted age, but I would have every man acquainted with his profession,—its principles and reasons,—be it what it may, and especially an art like this, which depends so much on our practical knowledge, and to which science may be so advantageously applied.

I would recommend the lectures to embrace the three great branches of knowledge: 1. Grazing, including rearing, breeding, and fattening, with their principles. II. Husbandry, including soils, manures, and crops, their nature and management. III. Operations; such as agricultural implements, with occasional ones on the prospects, importance, and encouragement of farming;—the effect of supply and

demand,—new principles, and general occurrences. These lectures should be delivered by persons who have some practical knowledge, and some experience, and should be delivered in villages and hamlets in the country, and not in the market towns, or on market days, when other business occupies the attention of the farmers. The same lectures might be repeated in twenty villages, and their conversations on the practical points raised might be invited, and information would be diffused, and interest excited, and the way paved to the adoption of sound scientific principles.

The third step I would propose is the publication of the experiments of practical men. On a small, but admirable scale, the Doncaster society has thus acted, and published two excellent reports; one on bone-manure, and another on mangel wurzel, and which are the most useful and practical little treatises on the subjects published. A quarterly or annual volume might be published, by most of the respectable societies, and thus interest is excited both by reader and writer. The papers of the Bath and West of England society, are of this character, and have effected much, as well as the highly useful papers of the Highland society of Scotland. In order to induce writers to exert their talents, I would recommend prizes for the best articles on certain subjects, especially the most difficult and complicated, as,—the food of plants;—the best modes of cultivating the newly introduced plants;—the best method of treatment for well known diseases incident to animals, &c. &c. The central agricultural society might effect this, in the easiest manner, and thus make itself of so useful and general a character, as to secure the attention and favour of the farmers in the country, and make it much more powerful and useful, as well as give an impetus to the advancement of agriculture.

W. E. N.

## FRENCH AGRICULTURE.

The proportion of pasture land in the canton of Calais is about 8,000 acres; the arable about 22,000 acres.

In the canton of Guines the proportion of pasture is much less, not exceeding 3,000 acres; the arable about 23,000 acres.

In the high lands, which in extent may be stated at full half the total extent of the two cantons, the land is various in point of fertility, consisting generally of reddish earth, but in many places poor and stony, improving as it recedes from the coast. It is mostly arable, with the exception of the forests. The low lands, which are more extensive in the cantons of Calais than Guines, are generally sandy or light earth; but being well watered afford good pasture, and where mixed with clay the arable is very productive.

Through the two cantons the extent of the land cultivated by the proprietors may be stated at one-half, the general size of farms being from 100 to 200 acres; but there are a few farms cultivated by proprietors of much greater extent, even as much as 1,000 acres.

The general size of the larger farms rented are from 150 to 250 acres. They are almost invariably let on lease for three, six and nine years, the tenant having the option of giving them up at the end of each of these terms on giving six months' notice; the farmer paying all taxes.

Land generally pays from 3 to 4 per cent. The average rent of the first quality of land is 45 francs,

or 1*l.* 18*s.*; of the middling quality, 30 francs, or 1*l.* 5*s.*; and of the inferior quality, 15 francs, or 12*s.* 6*d.* per acre, or mesure.

The stock fed on the pastures are oxen and cows and horses. The sheep are chiefly fed on the wastes, and on the uninclosed corn lands when there is no grain sown or corn standing on them. Every farmer who keeps sheep has the right of feeding them on all lands of this description in his commune.

So great a portion of the land being arable, all kinds of grain are cultivated; but I do not think there is any one kind cultivated in an extraordinary degree above another. Flax, clover and rape-seed are grown much more than in England. On the high grounds, where there is little or no pasture, the farmer depends on clover for winter food for his cattle. Turnips are not cultivated.

The average quantity of wheat and other grain produced on a mesure, or acre of land, is in the following proportion:—

	On the Best Land.	Middling Quality.	Inferior Land.
	Hectolitres.	Hectolitres.	Hectolitres.
Wheat .....	10 to 12	8	4
Oats .....	16 to 20	12 to 16	8
Barley .....	16 to 20	12 to 16	5 to 7
Beans .....	10 to 12	9	4

The hectolitre being 22 gallons, or 2½ bushels English Imperial measure.

The usual rotation in which grain is sown is—  
 1st year—wheat, and sometimes rape and beans.  
 2d year—rape, oats, beans, rye, peas, barley.  
 3d year—clover, flax, potatoes, &c.

The land is kept in continual crops, being seldom left fallow more than once in eight or nine years.

The rent is always paid in money.

The proprietor of the soil is not subject to any taxes, which are always paid by the tenant, the farms being let with that agreement. The proprietor would otherwise be subject to the foncière, or land-tax.

The taxes to which the farmer is subject are—

1. The foncière, or land tax.
2. The personnel et mobilière.
3. The doors and windows.
4. In the low lands there is also a rate amounting to one franc per mesure levied on the farms, for the expenses of draining the country, the repairs of canals, dykes, &c. The foncière, or land tax, is fixed in this department by dividing the land into five classes, as follows:—

The first class pays per mesure, 3 <i>l.</i> 50 <i>c.</i> 2 <i>s.</i> 11 <i>d.</i>
The second ditto, 2 <i>l.</i> 50 <i>c.</i> ..... 2 <i>s.</i> 1 <i>d.</i>
The third ditto, 2 <i>l.</i> ..... 1 <i>s.</i> 8 <i>d.</i>
The fourth ditto, 1 <i>l.</i> 50 <i>c.</i> ..... 1 <i>s.</i> 3 <i>d.</i>
The fifth ditto, 1 <i>l.</i> ..... 0 <i>s.</i> 10 <i>d.</i>

The taxes on a farm of 200 mesures, or acres of land of midland quality would therefore be—

Foncière.....	400 to 500 <i>l.</i>
Personel et mobilière...	100
Door and window tax..	20
	620 .. £25 16 <i>s.</i> 6 <i>d.</i>

In addition to this, on the low lands the farmer would have to pay the wattringue, or tax for draining, as before-mentioned, which would be 200 francs more, or, in English money, 8*l.* 6*s.* 8*d.*; but the farms on the high lands are not subject to this tax.

No taxes are levied for the support of the poor, assistance being afforded them only by voluntary

subscription, no poor laws being in existence. No rates or taxes are levied for religious purposes.

Almost all articles of consumption are subject to the duty of Octroi on entering towns. The following list will show the duties on articles, the produce of the surrounding country, on entering the town of Calais:—

Oxen, per head, 15 <i>l.</i> .....	12 <i>s.</i> 6 <i>d.</i>
Cows, heifers, bulls, do. 10 <i>l.</i> 50 <i>c.</i> .....	8 <i>s.</i> 9 <i>d.</i>
Calves, do. 3 <i>l.</i> .....	2 <i>s.</i> 6 <i>d.</i>
Sheep, goats, lambs, do. 2 <i>l.</i> .....	1 <i>s.</i> 8 <i>d.</i>
Pigs, do. 5 <i>l.</i> .....	4 <i>s.</i> 2 <i>d.</i>
Beer brewed within the circle of the Octroi, per hectolitre, 1 <i>l.</i> .....	0 <i>s.</i> 10 <i>d.</i>
Hay, clover, sainfoin and all other forage used as food for cattle, whether green or dry, per 100 bundles, the 100 bundles weighing about 1,100 <i>lbs.</i> English, 2 <i>l.</i> ....	1 <i>s.</i> 8 <i>d.</i>
Straw, do. 1 <i>l.</i> .....	0 <i>s.</i> 10 <i>d.</i>
Wood, for burning, the stère, about 36 cubic feet English, 2 <i>l.</i> .....	1 <i>s.</i> 8 <i>d.</i>
Large faggots, per 100, 2 <i>l.</i> 20 <i>c.</i> .....	1 <i>s.</i> 10 <i>d.</i>
Middling do., do. 1 <i>l.</i> 20 <i>c.</i> .....	1 <i>s.</i> 0 <i>d.</i>
Small do., do., 80 <i>c.</i> .....	0 <i>s.</i> 8 <i>d.</i>

For further information on this head, and for other articles subject to similar duties, I enclose a printed copy of the regulations and tariff of the Octroi of Calais.

The average price of butcher's meat is 11 sous, or 5½d per lb. in the country.

The average price of poultry is, according to the size and quality:—

Couple of fowls, 2 <i>l.</i> to 3½ <i>l.</i> .....	1 <i>s.</i> 8 <i>d.</i> to 2 <i>s.</i> 11 <i>d.</i>
A turkey, 2½ <i>l.</i> to 6 <i>l.</i> .....	2 <i>s.</i> 2 <i>d.</i> to 5 <i>s.</i> 0 <i>d.</i>
A goose, 3½ <i>l.</i> to 4½ <i>l.</i> .....	2 <i>s.</i> 11 <i>d.</i> to 3 <i>s.</i> 9 <i>d.</i>
Couple of ducks, 2½ <i>l.</i> to 3 <i>l.</i> .....	2 <i>s.</i> 2 <i>d.</i> to 2 <i>s.</i> 6 <i>d.</i>

The price of bread is—

The loaf of white bread, 4 <i>lb.</i> , 12 sous.....	6 <i>d.</i>
Ditto, mixed, do, 10½ sous.....	5½ <i>d.</i>
Ditto, do., do., 10 sous.....	5 <i>d.</i>
Ditto, brown bread, 5 <i>lb.</i> , 9½ sous.....	4½ <i>d.</i>

The number of hired labourers employed on the land depends much on the number of the farmer's family, also on the nature of the land, but it may be stated generally, that five or six labourers are sufficient on a farm of 200 mesures or acres of land.

A ploughman is always hired by the year, and on the larger farms three are kept. The wages of the first are from 180 francs to 200 francs, that is, from 7*l.* 10*s.* to 8*l.* 6*s.* 8*d.*; of the second, 120 francs or 5*l.*; and of the third, who is an apprentice, 75 francs or 3*l.* 2*s.* 5*d.* They are all boarded and lodged by the farmer. A thresher and other labourers earn 15 sous or 7½d per day, and their victuals. I consider 18 sous a day the maximum that a labourer can earn, taking the year through, and supposing him to be in constant work.

A shepherd has 60 francs (2*l.* 10*s.*) a year, with liberty to keep 10 sheep of his own with every hundred sheep of his master's, 250 sheep being about the average of the flocks; he has also his board and lodging and food for his dogs. If the shepherd keep no sheep of his own, he receives 300 francs (12*l.* 10*s.*) a year wages.

A female servant, hired by the year, has 75 francs (2*l.* 2*s.* 6*d.*) board and lodging. The above wages are always paid in money; it is, however, customary for the farmer to contract for the cutting of their corn, and in that case the wages are paid in kind the reapers who contract receiving seven sheaves in the hundred.

Labourers hired during harvest have 30 sous (1*s.* 3*d.*) per day, besides their victuals.

Labourers have their victuals as above stated, but are not lodged by the farmers unless hired by the year.

The general food of the agricultural labourer in this part of France consists of bread, potatoes and vegetables, and soup made of bread, vegetables, and a small portion of bacon or salt pork. On this head they are certainly not so well found as the English labourer, having very rarely, if ever, any kind of butcher's meat.

During the spring and summer the women are a good deal employed on the land, particularly in weeding the corn and flax, and planting potatoes, and in pulling the flax when gathered, which is always done by the hand. In the autumn they are employed in getting in potatoes. In these employments they can earn 10 to 12 sous (5d. or 6d.) per day. In the winter they go out to spin. A woman hired during harvest has 15 francs (12s. 6d.) a month and her victuals, if hired by the day during harvest, 15 sous (7½d.) per day, and her victuals. When they go out to spin, they have from five to seven francs a month, with board and lodging. When not hired during the summer, they go out to cut grass on the wastes or in the woods, which they collect for their cow in the winter; almost every cottager who has a family having his cow.

The number of men taken for military service varies according to the wants of the army; the general number is, for the canton of Calais, 50; and for the canton of Guines, 35 annually; making a total of 85 on a population of 38,077.

The ordinary price of a substitute for the army is from 1,000 to 1,200*l.*, that is from about 40*l.* to 50*l.*

The fuel used by the farmers in this neighbourhood is turf and wood, the former is procured from the turf marshes near Guines and Andres. The price of turf is 2½ francs per 1,000, or 2s. 2d. English. The wood is derived principally from the forest of Guines, and costs five francs, or 4s. 2d. per somme, a measure of about 18 cubic feet English.

The working dresses of the labouring population consist generally of coarse linen stuff, and costs about 24 to 30 francs (1*l.* to 1*l.* 5s.) The better clothing, worn on holidays by such as can afford it, costs from 60 to 75 francs (2*l.* 10s. to 3*l.* 2s. 6d.), and is something of the same material as that worn by the English people of the same class, though I think the English labourer is the better clothed. With respect to the comparative cost of the clothing of labourers of the two countries, I am unable to judge, having had no opportunity of making the observation in England for the last 30 years.

From 700 to 800 persons receive assistance from the "Bureau de Bienfaisance." This assistance consists in the distribution of bread, meat and clothing, and sometimes in payment of lodging, but never in money. The sick poor are visited by the physicians of the establishment, and have proper medicines delivered to them.

The revenue of the Bureau de Bienfaisance, is derived from an appropriation of 9,000 francs from the budget of the town, and 7,000 to 8,000 francs derived from voluntary contributions, collections at the houses and in the churches, and a per centage on the receipts of the theatres, balls, &c.—*Parliamentary Paper.*

SEEDS.—Further proof of the continuance of germinating power in seeds has been received, by the growth of some taken from tombs dated in the time of Marcus Aurelius, and also of Clodwig.

## ON AGRICULTURAL CHEMISTRY.

BY THOMAS SHAPTER, M.D., MEMBER OF THE DEVON AGRICULTURAL SOCIETY.

## No. I.

Agriculture may justly be termed, "The Art of making the Earth produce the largest crop of useful Vegetables at the smallest expence." and we cannot be surprised, when we think of the importance of agriculture to the human race, that a considerable degree of interest should be attached to its operations and results.

For it is evident, that as population increases, so, for its subsistence, must the earth send forth a proportionate quantity of its fruits; and a land, which in its natural condition would scarcely afford to a few scattered savages an unnutritious and scanty meal, is made by the industry of the husbandman, to give forth fruits sufficient for the maintenance and for the wants of the condensed masses of civilised man.

Although we are in a great measure ignorant of the rural economy of preceding ages, yet the fact that large masses of men inhabited small districts, is sufficient evidence that agriculture was an object of attention among them, and that its operations were practised with success. And ample proof is offered to the importance that was attached to it amongst the ancients, by the fact that they esteemed the goddess who presided over rural affairs, to be their first legislator; and to her did they offer up offerings, sacrifices, and prayers, when idolatry was a curse upon the earth.

We might lay before the reader the consecutive history of agriculture in different ages and different countries, but it tells but a sorry tale:—for, while every art and every science has been the subject of experiment and proof, a vague and fortuitous experience has alone, until very lately, tended to the success of agricultural pursuits, and to the flourishing condition of its operations.

Though Hesiod in his "works and the days," has given instructions to the cultivators of the field;—though Pliny, Cato, and Columella, the learned agriculturists of a former æra, have shown that the ancients were aware of the importance of manuring those soils which they cultivated; and though Theophrastus informs us they mingled soils together to increase their fertility;—yet not a gleam of rational science helps them in their experience.—It was so, and they were satisfied.

It has now, however, become to men's minds, too obvious that experience may be improved by the assistance of science, for them to sleep upon their ignorance, and permit its arcana to be unpenetrated; and the result to be anticipated is, that the skill, so fortuitously acquired, will be no longer of partial or local application only, as it formerly must have been.

England and France have beamed forth a meridian of great names, which have shed a new light on the objects of this, as it may be termed, branch of natural philosophy; and while some have applied to its purposes the improvements in Mechanics, others have made Chemistry subservient to the drawing from the earth its hidden resources.

There can be no doubt that the application of this science, which is the object of my present endeavour, is surrounded on every side with difficulties, for it is no easy task to trace with certainty or exactness the connexions of effects with their causes: a long time may be required to develop the result of experiments; the number of conflicting occurrences that are present, and which may intervene to throw a

shadow on what should be clear; the various and indeterminate influences of the elements; and more than all, the unsearchable processes of nature; all tend to obscure the "wherefore" of results.

Nevertheless, some hopes of certain success may be entertained; for, to the diligent inquirer, Chemistry has become a certain science, and its connection with many operations of nature, and its application to the purposes of rural economy, have been proved to the enriching and honour of this country.

We are now aware how necessary it is to those engaged in the study of the phenomena of nature, to understand intimately the elements engaged, and the affinities and relations that they exercise.

The province of the chemist is to search out these elements, and to study their affinities. And as all the laws of nature are immutable, he is enabled to infer, from previous experiment, the results that may accrue from meditated causes.

Chemistry, as we now meditate applying it, tends to a knowledge of those circumstances that influence the growth of vegetables, and to the actions of the agents that excite their functions. Unlike the animal world, the vegetable creation cannot go in search of the objects necessary to its being; but then the necessary conditions are brought by providing nature into juxta position with the fixed plant; the atmosphere and its products, the earth and its contents, yield the required sustenance; the consideration of which must obviously be the province of Agricultural Chemistry.

My present purpose, then, is to give in these essays a condensed view of chemistry, as applicable to agricultural affairs; and hope, in other parts of this journal, to shew that the application of its laws to various parts of this county, may be attended by local advantages.

The atmosphere of course will be the first object of consideration,—premisng, that vegetable matter in general can be resolved into three simple elements, which are named oxygen, hydrogen, and carbon.

It may be necessary here to say some few words in explanation of the term Elements, as used in the restricted sense of chemical nomenclature. Formerly it was thought that there were but four, and these were the earth, air, fire, and water; but the advancing state of chemical science has shown the erroneousness of these views.

Modern chemists call elements those ponderable and appreciable matters which contain but one substance, and are of an homogeneous nature, and of these about sixty have been discovered; while the innumerable affinities and combinations of these form the existences of the external world, and are, in the language of science, termed compound bodies.

One condition of these elements it is important to bear in mind, and it is, that they are indestructible; and though to the ordinary observer this may appear contrary to the experience of common observation, yet when we bear in mind that although water be dissipated by heat, yet the elements that formed the water are to be found in the steam; and though gold may be dissolved by the action of a solvent, yet may the gold be recovered from its solution; and though the green tree may be consumed, yet the products of its destruction contain the elements that compose it;—forms and characters of aggregate bodies may be destroyed, but the elemental particles that were the essential of these forms are indestructible. The affinities are at an end, but the elements exist.

It is one part of our present enquiry to place matters in such position that relations may be excited; and another part, that they may be destroyed. For it

is by these means that the knowledge of the component parts of bodies are required; and this includes the purposes of synthetical and analytical chemistry.

We mentioned above, that, generally speaking, vegetables were composed of the elements named oxygen, hydrogen, and carbon; there is another which is sometimes present—nitrogen. As the mention of these may occur very frequently in the course of the present enquiry, in consequence of the importance of their combinations, I shall at once proceed to detail some of the principal properties of each.

Oxygen\* is a gas, colourless, has neither smell nor taste. It is very sparingly absorbed by water, one hundred cubic inches taking up only four of the gas. It is neither acid nor alkaline, for it does not turn green or red the vegetable blues; nor does it appear to have any particular disposition to unite with acids or alkalies. It has a great disposition to unite with simple bodies, and the combinations with these are either termed oxides or acids.

Oxygen is termed a supporter of combustion, as the presence of oxygen is necessary to combustion, and a candle burns merely through the supporting influence of the oxygen that is combined with the nitrogen to form the atmosphere. It is necessary to the permanence of vegetable and animal life.

Hydrogen is a colourless gas, having neither taste nor smell, and, as opposed to oxygen, is called inflammable. It is the lightest matter we know. Plants or vegetables could not exist in this gas. Oxygen and hydrogen, mixed in due proportions, are the component parts of water.

Nitrogen, or, as it is often termed, azote, is colourless—has neither smell nor taste. It is not a supporter of combustion; on the contrary, has the positive effect of extinguishing it. Is destructive in its unadulterated state to animal and vegetable life. It is not inflammable.

Combined with oxygen, it forms the atmosphere.

Carbon, or pure charcoal, will be more usefully considered by us in the condition of carbonic acid, or fixed air, as it has commonly been called. Carbon itself is by far the most important vegetable principle we have to consider—it is the foundation of vegetable matter.

Its compound the carbonic acid is colourless and inodorous: it is incombustible, and positively hostile to combustion, and destructive to animal and vegetable life.

Carbonic acid is formed in the atmosphere, though only in small portions. The agriculturist will easily recognise it as that powerfully-destructive vapour which is driven from the lime-stones by the action of the heat in the kiln.

The agreeable pungency of beer, porter, ale, soda water, &c., is from the presence of this gas.—It is a compound of carbon and oxygen.

I have purposely avoided saying more here on these bodies than was absolutely necessary to be borne in mind, as those persons who may desire a more particular knowledge of these elements can refer to the valuable works that are devoted exclusively to the general principles of chemical science, such as Dr. Henry and Dr. Turner have published,

I shall now proceed to consider the influence that the atmosphere exerts on vegetation, and its general relations with vegetable life.

As before said, the atmosphere is essentially com-

\* According to the doctrine of the Atomic theory, the equivalent for oxygen is—8; but as an adherence to the minutiae of this system would only involve the object of the present paper, I shall not burden these pages with it.

posed of a definite admixture of two of the elemental gases just mentioned—oxygen and hydrogen: besides these, there is generally found carbonic acid and water.

From the experiments that Saussure was enabled to perform, in his ascent of Mont Blanc, it would appear that the atmosphere does not alter in its chemical compositions in different countries, or at different altitudes; so that we cannot attribute to its influence the relative fertility of different places: but we must bear in mind, that it is the medium whereby certain imponderable fluids, which exert very considerable power, are presented in such conditions as to be favourable to vegetation; and these are heat, light, and the electrical fluids, which all vary very sensibly in different times and places.

I have stated above, that nitrogen combined with oxygen forms the atmosphere. We may infer that this mixture is not chemical, but merely mechanical. The proportions in which they are mixed, from experiment, are proved to be definite and constant; and, according to the best authorities, oxygen forms not more than twenty per cent. Its composition stands thus:—Oxygen 20, nitrogen 80=100 parts of atmospheric air.

It is not a little singular, that this last gas, which bears so large a proportion to the whole bulk, appears to exert no positive influence on vegetable existence; in fact, excepting in some rare cases, nitrogen is not found to exist in the individuals of the vegetable kingdom: it may be assumed that its chief utility is that of a diluting medium, whereby those gases which are necessary to vegetable existence are presented in conditions that are not injurious, which, in their pure and concentrated state, they are found to be.

The natural powers of plants are such that they can withdraw from the atmosphere the aqueous vapours, the carbonic acid and the oxygen, leaving the nitrogen to go in search of other supplies of these fluids: and this leads to a matter of some consideration; for if plants are constantly absorbing these essentials to its existence, whence is derived that constant source of compensation whereby the atmosphere is ever found to contain the same elemental proportions?—the only course, as Dr. Turner shows, by which oxygen is known to be supplied, is by the action of growing vegetables; a healthy plant absorbs carbonic acid during the day, appropriates the carbonaceous parts of that gas to its own wants, and evolves the oxygen with which it was combined: during the night indeed, an opposite effect is produced: oxygen gas then disappears, and carbonic acid is eliminated; but it follows, from the experiments of Priestly and Davy, that plants during twenty-four hours yield more oxygen than they consume.

Whether living vegetable make a full compensation for the oxygen removed from the air by the processes above mentioned, is uncertain. From the great extent of the atmosphere, and the continual agitation to which its different parts are subject by the action of the winds, the effects of any deteriorating process would be very gradual, and a change in the proportion could be perceived only by observations made at distant intervals.

To the action of the oxygen we are to attribute the germination of the seed, and by its presence in the atmosphere the decomposition of animal and vegetable matters; and it will be found in these, as well as in all other instances, where oxygen is called into new affinities, that it has entered into composition with other matters, which are then said to exist in the state of an oxide or an acid: as, for instance, the oxygen of the atmosphere acting upon iron ex-

posed to its influence enters into combination with it, and the new product is termed an oxide of that metal.

Though carbonic acid has so much lower a specific gravity than the other component parts of the atmosphere, yet Saussure found that its quantity bore the same relation to the whole atmosphere at all altitudes, though it should seem that the atmosphere contained less of this acid gas in winter than in summer: it never exceeds one in one hundred, provided there is a free circulation of air.

Without doubt, if, by respiration, combustion, or fermentation, a large quantity of this gas be given out in a close apartment, there will be found a larger proportion of this fluid, and which condition is prejudicial to vegetable life; as has been proved by numerous experiments made by Guy Lussac, Decandolle, and others: it is always found, however, that as soon as opportunity occurs, such an agitation of the air by wind, &c., this over-proportion of gas is disseminated through the atmosphere until it arrives at its proper state of dilution.

Plants are constantly absorbing, during the day, this carbonic acid gas from the atmosphere:—it is then decomposed by a vital power, which is inherent in the leaves, which function is excited, according to Decandolle, by the stimulus of solar light:—the carbon is appropriated and becomes part of the plant, while the oxygen is given back pure to the atmosphere.

There are many plants, such as creepers and those growing on rocks, that derive all their carbon from the atmosphere.

I before observed that carbon was the element to be found in greatest abundance in the vegetable kingdom; and to Hassenfraz do we owe the establishing of the fact, that it is their essential food, by a series of very beautiful and conclusive experiments.

Therefore provident nature has not only dispersed it through the atmosphere, but has plentifully supplied with it many substances that are found available to the purposes of vegetation: we find it occurring in many combinations—such as limestone, various soils, manures, &c., all of which will subsequently come under our notice.

Besides this gas, the atmosphere diffused over the face of the earth is charged with aqueous vapour, but unlike the carbonic acid, which is present at all temperatures and every altitude, it is confined to certain distances above the surface of the earth; as may be assumed from observations made by those who have attained great elevations in balloons.

That the presence of these two substances in the atmosphere is not only of importance, but necessary to vegetable life, is proved by the fact that vegetables do not thrive, when, by experiment, they are subjected to the influence of a pure air—that is, an atmosphere formed only of oxygen and nitrogen.

The source of the aqueous vapour is derived from the evaporation that takes place on the surface of the large masses of water that are scattered over the face of the earth; and, as it is found to bear some proportion to the surface exposed to the air, all countries, where there are large lakes, or whose coasts are washed by vast oceans, have an atmosphere more charged with it, than those which are inland, and consist principally of a dry country.

Many circumstances, besides the locality, tend to influence the quantity of vapour diffused through the air: a far larger quantity rises during stormy weather than is found to be the case in calm; and a far larger proportion in hot weather than occurs in cold.

The following table, as determined by Saussure,

shows the proportions according to the influence of temperature:—

Degrees of the Hygrometer.	Weight of water contained in a cubic foot of air, at 66o Fah.	Weight of water contained in a cubic foot of air, at 47o Fah.
	Grains.	Grains.
10	0,4592	0,2545
20	1,0926	0,6349
30	1,7940	1,0833
40	2,5634	1,5317
50	3,4852	2,0947
60	4,6354	2,7159
70	6,3651	3,3731
80	8,0450	4,0733
90	9,7250	4,9198
98	11,0690	5,6549

The mean quantity, according to Dalton, taking up by the atmosphere in twelve months, he estimates to be about equal to thirty cubic inches.

The modifications that are effected in the arrangement of the particles of this vapour, by various causes, become of the greatest importance to agriculture:—dew, clouds, rain, and snow, are its new forms.

When the temperature of the air is diminished, some portion of the vapour is precipitated; which phenomenon may be easily understood by the table just quoted, in consequence of the diminished capacity of the atmosphere for vapour—and this precipitation is called “dew.”

The mode in which all the component parts of the atmosphere are brought and maintained together is very singular, for they do not appear to obey in any way the ordinary laws of matter, as ranging themselves according to the order we might anticipate from their different specific gravities. Nor would it be an easy task, it being inferred their relations are not chemical, to separate them by mechanical means; yet their affinities are so weak and feeble as to be very easily destroyed:—thus the carbonic acid may be withdrawn by the exposure of a little lime-water, the oxygen by the exposure of a piece of iron, as the water is by the formation of dew.

Dew is a deposit of the aqueous vapour in consequence of the radiation of cold upon a warmer atmosphere charged with it: thus the cold summer nights, after a day of heat, are favourable to its formation, and the fluid, thus afforded, yields some compensation to the plants robbed, during the day, of their fluids by the fervent sun.

While dew is a deposit, clouds appear to be an aggregation of watery vapour, sustained, by influences we do not fully comprehend, to some height in the atmosphere. According to Luke Howard, the electrical action of one cloud upon another is the cause of rain; so that, as we find rain is the distillation of water which has been first evaporated and disseminated through the atmosphere and then condensed from the state of vapour, whatever will explain this condensation must form the theory of rain; and according to Hutton and Dalton, it is thus explained:—“If two masses of air, of unequal temperatures, are, when saturated with vapour intermixed by the ordinary currents of the winds, a precipitation ensues. If the masses are under saturation, then less precipitation takes place, or none at all, according to the degree; also, *ceteris paribus*, the warmer the air, the greater is the quantity of vapour precipitated. Hence the reasons why rains are heavier in summer than in winter, and in warm countries than in cold.”

This arrangement is of vital moment to agricul-

ture; for, had the law respecting aqueous evaporation been conceived on other principles, the refreshing rains of summer would not have been present to have compensated for the parching of the sun; the heat of torrid regions would not have been lessened, as it now is, by the cooling influence of the fluid-bearing atmosphere; nor would the cold of distant and frigid countries be carried through the air, to temper the excessive heat excited upon the surface of the earth by the meridian sun.

We find, in addition, a very beautiful sequence to this phenomenon of rain; for after it has fallen and revived vegetation, it is necessarily followed by a clearness of the sky and by sunshine, which are so necessary for stimulating the growth of vegetables, and giving health and vigour to growing plants.

Snow, which is the frozen condition of this vapour, preserves, on the other hand, the productions of the earth from the intense colds of winter, which is ever found destructive if it reach their roots. In its deposit from the atmosphere it obeys the same laws as rain.

Besides the carbonic acid and aqueous vapour, many other substances, which in some measure affect the growth of plants, pervade the atmosphere: on some coasts there is a very appreciable quantity of muriatic acid gas; mullaria, odoriferous matters of flowers, and other volatile substances, are only to be discovered by the sense of smell.

The imponderable substances of which the atmosphere is the medium of transmission, are of great importance to agriculture.

Of the principles or cause of electricity nothing certain is known. It possibly may be nothing more than an essential property of matter called into action, when this matter is subjected to particular circumstances; but the phenomena which take place accord much better with the now pretty generally received opinion, “that it is a highly subtle elastic fluid, too light to affect the most delicate balances, capable of moving with extreme velocity, and present in all bodies.”

Its power and properties in bodies that are excited are diffused in every direction, diminishing as the squares of the distance; thus obeying the same laws as light and caloric. Its phenomena are of such importance and magnitude, as to entitle it to be ranged amongst the most energetic principles of nature.

Thunder and lightning are some of the results of its power, and every agriculturist is aware of the influence exerted by such storms on vegetation; and a fair inference may be drawn, from these and other observations, that the superior value of natural rains over artificial waterings and irrigations mainly depends on the peculiar conditions of the atmosphere. What these peculiar conditions, and what their fixed effects on vegetation, are, have not been very clearly defined; but we are aware that all matters which are the medium of its transmission are subjected to very considerable electrical changes, during which peculiar effects on vegetable life are eliminated. Du Hamel has made the remark, that vegetation is most active in stormy weather, and that the more fruitful crops are the produce of such seasons; and he contrasts the experience of many years to show the truth of his deductions. It is not a little singular, though it is an additional proof of the power that electricity has over vegetation, that mushrooms are destroyed in thunder storms; and those who cultivate them are so well aware of this, that on these occasions they remove them into caves or pits.

Many experiments have been performed, illustrative of the prodigious effects of this subtle fluid on

vegetation, which it would be here tedious to particularize; that which most bears upon the present inquiry goes to show why the *natural* rain is so beneficial—for it was found that grain germinated more rapidly in positively, than in negatively, electrified water: and experiment has also proved, that clouds dropping rain are, generally speaking, negatively electrified; while the surface of the earth, like the water, is in a state of positive electricity.

Those desirous of following up this most interesting enquiry, would do well to consult the excellent works of Sir H. Davy, Decandolle, and Hutton.

The matters of heat and light are essential to vegetation: deprived of these, their natural functions are not excited, and they cease to exist.

Of the matter of heat, or caloric, as it is termed in the language of science, there is, no doubt, a very large quantity disseminated through the atmosphere and the bodies composing the earth. Experiment has proved that the solidity and fluidity of bodies depend upon the subtracting or addition of the matter of heat; for it is found, that as caloric is added to the particles of bodies, it tends to separate and modify their molecular attraction, and weaken their affinities: thus, for instance, caloric added to water converts it into steam, which, by its abstraction, recurs to its former condition, or even to the solid state of ice.

The temperature of the atmosphere varies with its elevation. The reason is this:—Gaseous fluids permit radiant matter to pass freely through them without any absorption, and therefore without their temperature being influenced by their passage. The atmosphere is not heated by transmitting the rays of the sun, but receives its caloric solely from the earth, and chiefly by actual contact; so that its temperature becomes progressively lower as the distance from the general mass of the earth increases;—and for this reason it is that vegetation ceases at high elevations. As an illustration of the above, I may state, on ascending Carin Gorum on 23d August, 1823, the temperature of the low country was oppressive; at the summit the thermometer stood at 34 deg. Fahr.

Elements, whose natural existence is gaseous, but become solid in consequence of combination with other matters, regain their natural condition, if heat sufficient be applied to destroy the affinities which had been excited.

We must also bear in mind, that various physical phenomena are attended by the evolution of caloric, and on which depend the efficacy of many of the processes of agriculture, and the changes excited in bodies by new affinities, whether these changes be effected chemically or mechanically.

Caloric has what is termed the power of radiation; therefore we find that all bodies, no matter what they are, if in juxta position, become of the same temperature—the deficiency of the one being compensated by a gain from the other: thus an equilibrium is produced.

Many circumstances, tending to the variation of the temperature, will come under our notice in the discussion of agricultural affairs. Of course the changes effected by the distance of the sun are the most important; but those effected by the various compositions and decompositions of animal and vegetable matters become of vast importance.

The natural effect of heat is to dilate bodies, and to enfeeble the force of that powerful cohesive attraction which unites their molecules, so that the action of different and opposing affinities is facilitated, paving the way for new combinations: so that we find the changes of temperature which the atmosphere

undergoes in the course of the year are such, that some liquids pass into vapours, others into solids. In the application of this, we may trace all the phenomena attending the formation of dew.

According to this law, heat of a certain temperature renders more fluid the juices of a plant, facilitates their movement through the cells and vessels, excites its organs, and gives an activity to the suckers of the root whereby it absorbs the juices contained in the earth: but, above that point before alluded to, it dries up the plants by facilitating the evaporation of the water, and, by thus taking away its fluids, thickens those matters which are dissolved in them, by which the circulation becomes impeded in the dry and shrivelled vessels, causing vegetation to be arrested, and, as a sequence, life to be suspended. These are the effects that take place during long droughts, when it is found that the night dews are not sufficient to repair the loss occasioned by the transpiration and evaporation of the fluids. This noxious effect would take place more frequently, had not ever-providing nature employed means to moderate the influence of the heat.

The first of these depends on the evaporation of the fluids from the vegetable itself; for as the effect of evaporation is to decrease temperature, we find that, through its influence, the heat is modified to that point which the vegetable can sustain. The second means exists in the organization of the leaves, which is that portion of the vegetable in which the function of transpiration exists: for that surface which is exposed to the direct rays of the sun, is covered by a thick and glossy epidermis, which has the power of repulsing the caloric rays. This glossiness depends on different circumstances: in herbaceous plants it is, for the most part, silicious or flinty, as is found in the grasses; in other plants it appears to be analogous to wax, gum, resin, honey, &c.

The epidermis which covers the subsurface of the leaf is thin and transparent, and through its vessels the absorption and transpiration of the fluids principally take place. The natural position of the leaf, caused, as it is assumed, by the stimulus of light, is a striking example of the wisdom of the creation; for this latter part is ever underneath, sheltered of necessity from the light, enjoying the cool of its own shade; while the former-mentioned side, with its refractive powers, resulting from the glossiness of its surface, is that which is exposed to the light: so strong is the natural tendency to proper order, that if, by mechanical means, it be reversed, the position of the leaf will shortly establish itself in its former situation.

When the temperature falls below the medium point, the fluids are condensed, the movement of the juices is retarded, the activity of the organs are diminished, the vital functions languor, and eventually become suspended; in which state they remain, unless an increase of temperature ensue to reanimate them.

As a converse to what was said, when speaking of the compensating influence of the evaporation from the plant in hot and oppressive weather, we find that the action of atmospheric cold, when applied to a plant is modified by the emission of caloric from the plant itself; for, as its substance and juices become condensed, their capacity for caloric is decreased; and, on this account, we find, in winter, that plants are a few degrees warmer than the atmosphere. Besides this, as the earth is warmer in winter than the atmosphere, the fluids which the roots absorb are also warmer; and as the fluids themselves, and the wood through which they circulate, are bad conduc-

tors of heat, a superior temperature is supported: and as the earth is colder in summer, the very converse takes place, in obedience to the same laws; from which circumstances, we are enabled to state, that plants have in themselves an inherent power of resisting extremes of temperature, according to the quantity of fluid contained in each plant—the consistence of the fluids—the slowness or quickness of the circulation of these fluids—the quantity of atmospheric air contained in the fluids or solid parts—the form of the cells, &c. &c.

But, though they have this faculty of supporting extremes of atmospheric variation, and, from the nature of their component parts, are enabled to keep up an approach to a certain equilibrium of temperature, and which is all to be explained by the common laws of physics; yet it does not appear, as some eminent naturalists have supposed, that they have any independent vital power of generating heat, and in maintaining a fixed temperature. An extensive series of experiments on the variations of temperature has been made by many, especially by Professor Schubler, of Tübingen, with a view of settling this point; and as the results of these observations are, on many accounts, interesting, I shall offer a condensed view of them here.

No perceptible heat is evolved by trees during the process of vegetation: their mean temperature is that of the atmosphere, or even a little lower; which last circumstance is, probably, owing to the constant evaporation which takes place from the surface.

During severe cold, the temperature in the interior of most indigenous trees often sinks several degrees below the freezing point.

The temperature of trees sinks less rapidly after it has once got below freezing: this is most probably to be attributed to the heat evolved during the congelation of their juices, which, in a certain degree, counteracts the effects of cold till the tree is frozen in the centre.

When a thaw sets in, a phenomenon, in some respects the converse of the foregoing, takes place: the temperature of trees, which have been frozen and cooled considerably below the freezing point, rises with less rapidity than when the heat is above that point.

On comparing the mean of entire seasons, it appears, that in summer, trees have a lower temperature, in proportion to that of the air, than in other seasons. It is very probable that this is owing, partly to the copious evaporation from the surface of the tree in warm weather, and partly from the cold temperature of the watery fluid absorbed by the roots from the deeper parts of the soil, which absorption is most abundant during the heat of summer.

The temperature of trees in spring is somewhat higher than that of the surrounding air: this apparent exception may be explained, when it is recollected, that in our climate the heat of the deeper parts of the soil, from which trees then largely extract nourishment, is usually greater in March and April than that of the air; and that the surface of the tree itself, so long as it is not shaded by foliage, may be heated directly by the sun's rays, whilst, in such circumstances, it loses very little heat by exhalation.

The juices are actually frozen during severe cold: the degree to which frost penetrates in different trees is found to be proportionate to the quantity of their watery constituents, and the openness of their texture.

It follows, as a general result of these observations, which, in the main, agree with the laws already

laid down, that the temperature of plants is modified by many different circumstances;—that they do not, indeed, like the higher animals, possess the faculty of evolving heat in their own vital processes; \* but that they have the power of conducting heat from the air, and from the soil, in proportions varying with the course and impulsion of the sap, and of giving off part of it again by evaporation; so that, being bad conductors of heat, their more equable temperature must necessarily be sometimes either higher or lower than the more variable temperature of the atmosphere.

Dr. Göpsert, of Preslaw, endeavours to show, by numerous experiments, that the sap in plants freezes in winter, when the cold is severe, without injury to life; that the changes which plants undergo, when they are killed by cold, do not exist in a bursting of their vessels or cells, but solely in an extinction of vitality, which is followed by changes in the chemical composition of their juices; so that the effects of cold on vegetables are not always directly proportionate to its degree, but are modified by the relative state of development in the vegetable, together with numerous other circumstances connected with atmospheric changes.

When a plant withers and dies, after having fulfilled its destiny of forming seed, then the action of heat is modified by none of the vital influences that are excited during life, and its impressions are received according to the fixed laws of physics, as opposed to those of vitality.

If, however, the temperature should fall below a certain point, which point must be relative, depending, in a great measure, on the nature of the plant, its death ensues, and its fermentation and putrefaction is accelerated when a higher temperature returns; thus becoming, in its turn, a source of heat, and a furnisher to the earth of matters proper to the nourishing of its species.

That the action of light on vegetables is of very great importance, is well known, but its intimate relations have not been particularly studied: we know that there are calorific rays, and rays of light, and that their powers are different. Amongst its effects are the influences it exerts on the growth, colour, and perfume—the opening of the petals—the unfolding of the leaves—the erection of the stalk—and the absorption and respiration of carbonic acid gas.

If two plants are exposed, one to darkness, the other to the sun, in inverted bell glasses, with an atmosphere, containing a known quantity of carbonic acid, after twelve hours it will be found, that, in the first the quantity of oxygen, or of carbonic acid, has not diminished; while on the contrary, in the other the quantity of carbonic acid is diminished, and the free oxygen increased.

If two similar plants are placed under different bell glasses, exposed to the light of the sun, the one with an atmosphere deprived of its carbonic acid, the other having the ordinary proportion, we shall find, after a few hours, that the atmosphere of the first vase has undergone no change; while that of the second presents an increase of oxygen proportioned to the carbonic acid which has disappeared. If an analysis of the plant be carefully performed, it will be found to have increased itself by a proportionate quantity of carbon: so that, we conclude, the carbonic

\* Though I am obliged to subscribe to this, as experiment and observation will not warrant any other conclusion, yet I am convinced, were science more certain, that we should find plants, like animals, are possessed with a power of generating heat.

acid has been decomposed, its carbon appropriated to the plant, and its oxygen rendered back to the atmosphere; and this is effected by the interference of light.

The deduction from these facts is this, all things being equal:—That the quantity of carbon combined with a vegetable in a given time, is in proportion to the quantity of light to which it has been exposed. As the carbon forms a chief portion of the vegetable world, we infer it is circulated through the plant, and, after having entered into the formation of its different parts, becomes again under the influence of light.

If the light be too strong for the nature of the plant exposed to its influence, the several functions whereby the plant is nourished, such as the suction power of its roots, the exhalation of its leaves, and their function of decomposing carbonic acid, are performed in excess, and a proportionate defect accrues in perfecting the seeds, few or none of which are then ripened.\* If the light be too feeble, these necessary functions are not completed, and the plant becomes pale and dropsical. Many effects which are popularly ascribed to the influence of the atmosphere, are, in fact, due to the action of light: thus there is an increased produce from corn which is grown upon ridges alternating with others, which are allowed to lie fallow; and thus the more robust condition of such trees as grow on the outskirts of a forest must be attributed to the greater light which they enjoy. But, as a consideration of this encroaches upon vegetable physiology, I refer those curious in the inquiry to the works of Decandolle and Richard, who have largely written on it.

In concluding these, which may be termed introductory observations, I offer no apology for their brevity, as my intention was to say no more than would bear upon the subject matter of inquiry. Those who are acquainted with physics generally, will see nothing of novelty in the principles here developed; and those whose attention has been devoted to vegetable physiology, will recognize their application; but I deemed it necessary thus to preface, in order that the topics which will be the subject of my future consideration, might be fully understood. In the next article I shall enter into the discussion of the chemical composition of soils and their manures, and, where opportunity offers, shew the application of the principles laid down to the agricultural position of this county.

**STALL FEEDING.**

Stall Feeding, which is now become so much more common throughout the country than formerly, has had the effect of making meat in most years as cheap in the spring as in the autumn, which it used not to be; consequently stall-feeding, of late, has seldom turned out to be profitable, but often, as I have experienced, a serious loss. Meat cannot be laid on lean beasts in the stalls, to repay the expense of the food they consume; the only chance of making stall-feeding answer is, to put in the beasts which prove to be only three parts fat at the latter end of the autumn, when grass will no longer improve them, but which will in the stalls, increase in their weight, and improve in the quality of their meat; still however, if the price of beef when these beasts be-

come fat should be the same as when they were put into the stalls, the expenses will not be repaid. Meat must be a penny a pound more in the spring than it had been in the autumn, to repay the great expenses of stall-feeding. It is carried on to a very large extent in Norfolk and Suffolk, and although from the great expense of oil cake consumed, the farmers certainly must lose by every beast they feed, still they must continue the system on their large arable farms, for the purpose of turning their straw into good manure.

On beasts being tied up, white turnips will do for the first week or so; they keep beasts cool inside, but there is so very great a proportion of water in them that they are not of half so feeding a nature as Swedes. Those who have mangel wurzel should keep it as a corps de reserve, for spring, or severe frost when the turnips are frozen, which are often given to beasts almost as hard and as cold as stone, and which in such a state cannot be good for them. The turnips should be cut—there are many machines for cutting and slicing. The machine I use, and like better than any I have seen, I have had five and twenty years; it was made at Banbury, turns very easily with a large fly-wheel, and cuts the turnips very expeditiously into irregular pieces, which I prefer to slicing them. My method of feeding, when the beasts have been up a little time, and when on what I call full feeding, is thus:—first feed in the morning, half a bushel of cut turnips, and afterwards half a bushel of cut hay, with about a quart of meal in it. These feeds repeated at noon; in the afternoon a feed of turnips, and supped up at night with hay in the rack, and three oil cakes in the manger. Should oil cake be cheap, give more of it, and less of meal. The difference of the weekly cost of my way of feeding is as hereinafter stated.

Oil cake at 12<sup>l</sup> per thousand in London, with the cost of about 2<sup>l</sup> per thousand getting home, will bring the cost of each cake to very nearly three pence halfpenny. At 10<sup>l</sup> 10s to three pence.

The different weekly cost of feeding for each beast will be as under:—

	s. d.		s. d.
10½ bushels of turnips .....	3 6	Half a bushel of linseed .....	3 6
1¾ cwt. of hay .....	5 10	Three gallons of meal .....	1 6
		1¼ cwt of cut and uncut hay .....	4 2
		Turnips .....	3 6
	9 4		12 8
Turnips .....	3 6	21 oil cakes at 3½d .....	6 0
1½ cwt of cut and uncut hay .....	5 0	Three gallons of meal .....	1 6
Half a bushel of meal .....	2 0	Cut and uncut hay .....	4 0
	10 6	Turnips .....	3 6
			15 0

No food can be given to stall-feeding beasts that will fatten them so soon or so well as linseed oil-cake. It certainly is expensive feed, but not so expensive as it appears to be, taking into consideration that it fattens quicker. The expense of it compared with other stall-feeding food is thus; when it costs the consumer at home 12<sup>l</sup> 10s per thousand, each cake said to be 3lbs (but never are quite so much,) the stone of 11lbs costs 1s 3½d. Linseed, at 56s per quarter, 1s 11d. Barley meal, when the price of good grinding barley is 26s per quarter, the stone will be about 11d. The stone of bean meal, when beans are 32s per quarter, the

\* Vid. article in Foreign Quarterly Review, for April, 1833.

same. Some winters I have fed with linseed instead of cake, and found it answer very well, although it added to the trouble of feeding. My mode of preparing it has been to break it in a little hand-mill, and steep it in cold water, in seven tubs, of a size sufficient for one day's feed; in this way it will have been steeped seven days before it is mixed with cut hay and barley, or (that which is better) bean meal: if steeped in hot water, two days will do; if steeped longer than three, it is apt to get a little sour, which I think not quite so well for the beasts. There are annually great importations of linseed, from which I conclude that it can be imported at a less price than it can be produced here. It is grown pretty extensively in some parts of the kingdom; it is however to be regretted that the cultivation of it cannot be more general, and prevent the necessity of such great importations; and thus circulate amongst the English farmers a large sum of money which now finds its way into the pockets of foreign farmers. I have not yet made such use of wheat in feeding as to enable me from experience to speak decidedly about it. I have hitherto used only my tailing wheat, ground with barley, and thought it answered very well; but I hear of numbers of beasts being now fed entirely with wheat; and, it is said, quite as well fed, and at a much less expense than with oil cake at its present price. The way of preparing it for feeding is thus: steeped thirty-six hours; then laid for five days on a brick floor, turning it over once a-day; then laid on a boarded floor, about six inches thick; in two days it will be fit for use. One gallon and three quarters, in the grown state, per day, for each beast, is said to be about equal to one bushel per week of dry wheat. Having lately seen one ox that was said to have been entirely fed on wheat, leaves no doubt in my mind that it must be a very nutritious food for beasts; I cannot, however, restrain some feelings of regret that this grain, intended only for the use of man, should be thus appropriated. Most likely, after two more harvests, the price of beans and barley will correspond, as it used to do, with the price of wheat, and then it will no longer be given as food for beasts.—After all the great trouble and expense of stall feeding, this mortifying circumstance has frequently occurred: the beasts are sold in the London market at a ruinous price to the stall-feeder, at less than they would have made in any other market; the butchers knowing that the beasts, having been so much knocked about in Smithfield, could not be turned out of an overstocked market to come into the next, have frequently bought them at their own prices. It will not be thus when the Islington Market is quite established.

I have given rather lengthened details of stall-feeding, from its having been for some years my hobby; but I confess rather an expensive one; no fox-hunter, however, can look with greater pleasure on his stable of fine hunters than I have at my stalls of fine beasts. I have tied up several years, in the course of the winter, one hundred and fifty beasts; at this time, (December, 1885,) I have only forty, chiefly well-bred Durhams, grazed in this county, and I never had beasts that improved faster. I have some fine Herefords, bought good meat at Hereford October fair, but from the drift home (as is always the case) they made little progress in feeding in the first three weeks of their being tied up. If beasts that are put up in warm places to stall feed have a great

deal of long hair on their chins, top of their shoulders, and necks, it is a good plan to cut it off, for when the beasts are thriving, they perspire much in their fore quarters, the long hair consequently gets matted together, and makes them very itchy and uncomfortable; brushing also tends to their comfort and expeditious feeding.

Many beasts are subject to be blown after eating their green food, in such case let them be kept moving in a yard till the swelling goes down. If cutting to let the wind out be necessary, it should be done with a pen knife on the left side, between the haunch-bone and the first rib.

It is not very probable that either grazing or stall-feeding will ever again prove a profitable concern. Great quantities of fat beasts and pigs will be imported from Ireland, even should the condition of the Irish poor improve so decidedly that the consumption of meat be increased two-fold, for Ireland would still be capable of producing a sufficient quantity for export to depreciate the price of stock in this country. Those will have the best chance of making a profit of grazing who can get beasts forward in winter, and who have rich grazing land to make them early ready for market, there being generally a fair demand for good beef in the months of July, August, and September. Times will not admit of giving exorbitant prices for fancy breeds; still, however, I have found that it well answers to give something more for beasts which evidently show some good breeding, as such will fatten much sooner than mongrels, and therefore at less expense, and although there is not now the same difference as there used to be in the price of meat of various qualities, yet the finest is most readily sold at the top price of the market. There cannot be a question but that in the large breeds of cattle, the competition is between two breeds only—the Hereford and the Durham. I retain the same opinion as to the merits of these two excellent breeds, as I expressed more than twenty years ago. For grazing I prefer Herefords—for stall-feeding Durhams; having found that the latter increase faster in weight, and that if highly fed they become more even carcasses of beef, and are less likely than many of the Herefords to prove patchy. It must, however, be admitted that from their larger frame they consume more food than Herefords. My idea of a good beast is, that it should have a straight and flat back, projecting hips, deep fore quarters, wide chine, sloping shoulders, good head, with prominent eyes, deep and bowed ribs, projecting bosom, good purse and flank, and not thin thighs.—*Hillyard's Practical Farming.*

Although good workmen, generally speaking, are more likely to meet with employment in Van Dieman's Land than in the over-peopled districts of England, it cannot be said that there is much *immediate* want of either. Labourers obtain from 3s to 3s 6d per day, and sometimes 4s, while mechanics vary according to the trade and demand from 5s to 7s and 8s per day. Experienced gardeners, millers, trustworthily overseers, and, we grieve to add, teachers, must not expect more than from 25l to 30l and 40l, and rarely 50l per annum, with board and lodging. A few good dairy women might get employment at 12l a year.—*Hobart Town Courier.*

## THE SHEEP.—No. I.

[FROM THE DUMFRIES HERALD.]

We have received from a very ingenious friend a series of papers on the SHEEP, containing so much learned and curious information, and so many speculations, as well original as selected, that we need make no apology for laying the whole before our readers, so many of whom are connected with this important branch of husbandry. This week, accordingly, we present them with No. I. of the series. We by no means pledge ourselves to all the opinions of our talented correspondent; and we can hardly expect that the practical experience of many of our farming friends will not detect points in these papers at least doubtful, if not openly at variance with what they experimentally know. Where such errors occur let our readers indulgently correct them for themselves, and still be pleased with what is unquestionably valuable in the lucubrations of our correspondent. The following is his

## PREFACE.

The importance of the subject obviates the necessity of an apology, in presenting to our readers a series of papers on the sheep. Many works there certainly are, which touch in a casual manner on unconnected points in the history of this animal, and many also devoted to some one in particular of its diseases, but there are few, if any, which afford, in little compass, a correct view of every thing that has been said about it for the last 6,000 years—not that we intend presenting to the public an unbroken chain of information, for that, in spite of extensive facilities for reference, is beyond our power, owing to the numerous blanks that must necessarily occur in the scattered observations on its progress down the stream of time. Little, if anything, original can be said, but where opportunity offers we will not hesitate to draw our own conclusions from the mass of evidence, seeing it is in many parts faulty in the extreme, and only to be corrected by an attentive observer of the whole. Though this our first division of the subject may by some be reckoned trivial, yet on attentive consideration it will be found that the history of the present animal is as nothing without the history of the past. That its remote history is so interwoven with the transit of mankind, from barbarism to civilization, and our remarks on its structure and varieties so intimately connected with our views of its diseases and value, as to entail upon us, by neglect of the one, neglect of the other, and by so doing oblige us to remain, to borrow the words of Sir Isaac Newton, like a child picking up pebbles on the shore of the vast ocean of truth.

The works from which our information is culled will, in general, be mentioned, as the desire of giving "old ill-told tales for new-born anecdotes" is luckily far from us, thus putting it in the power of the gentlemen farmers,

"Who, in large mansions, live like petty kings,  
And speak of farms but as amusing things;  
Who plans encourage, and who journals keep,  
And talk with lords about a breed of sheep,"

to follow up, at a small expense and trouble, those investigations which to us, for want of similar aid, have been laborious.

## HISTORY OF THE SHEEP.

Campbell, that princely poet of our battle fields,

beautifully exclaims in his warning of Lochiel, "coming events cast their shadows before," and beautifully was the event—the mighty atonement for our sins—forth shadowed in the offering, at the Christian altars, from time immemorial, of the fleecy people.

The earliest notice of this interesting animal occurs in Genesis (B. C. 4004,) where Abel is mentioned as a keeper or feeder of sheep, and after a great lapse of time the flocks of Lot (B. C. 1918) receive a passing tribute. Immediately following, and occurring in rapid succession, we have points in its history which deepen our interest in its study, as here we have the first account of its being used with other animals by Abraham as a sacrifice (B. C. 1913,) and of Abraham being prevented offering up his son Isaac by God substituting a ram (B. C. 1872.)

Rachel, the "beautiful and well-favoured," appears to have been the first shepherdess, and to have been wooed and won by Jacob while tending the flocks of her father Laban (B. C. 1760.)

Jacob was an excellent shepherd, and made good the losses which his master sustained both by day and night. The striking physiological experiment of which he was the planner, shews, in the minuteness of its details, the advanced state of philosophical enquiry even at that remote period; the last verses of the 30th chapter of Genesis, containing in fact the sum and substance of many a bulky modern treatise. That "the cheerful tendence of the flock" was at that time, as at present, a source of delight only to certain nations, is proved from a shepherd being mentioned in the 46th chapter of Genesis, as an abomination unto the Egyptians; and a little further on Pharaoh is represented as appointing the active men in the train of Jacob as *rulers* over the Egyptian cattle.

Moses (B. C. 1571) assisted the daughters of Jethro, priest of Midian, to water their father's flock, and in return for this service received one of the daughters in marriage, becoming afterwards a shepherd.

Pharaoh, in permitting the departure of the Israelites, endeavoured to detain their flocks (B. C. 1491), from which circumstance we may infer them to have been of considerable value. In the same year we notice the institution of the Passover, in which a lamb was to be the sacrifice, one for each family; and the first born of man and beast are commanded to be redeemed by a lamb. Among other offerings for the tabernacle, mention is made of "rams' skins dyed red," and shortly after two rams are sacrificed during the ceremonies of consecrating the priests. No other mention of importance is made till the Lord commanded Joshua that "seven priests shall bear before the ark seven trumpets of rams' horns," being the first record of their use as warlike instruments.

Homer, (B. C. 907) in giving us a peep at Venus as she appeared to Helen on the walls of Troy, and alluding to her disguise, says—

"To her, beset with Trojan beauties, came  
In borrowed form the laughter-loving dame;  
She seemed an ancient maid well-skilled to cull  
The snowy fleecy, and wind the twisted wool."

Thus proving the existence of the useful arts to have been much indebted at that time to the fostering protection of the ladies, and shewing by the term "ancient," not that the use of the distaff was confined to ladies up in years, but that skill in its employment was only to be obtained by

a long term of servitude. In this pastoral age much care was bestowed on sheep, the habits of which were carefully attended to; thus Homer speaking of Æneas and his followers—

“ In order followed all the embodied train,  
Like Ida's flocks proceeding o'er the plain;  
Before his fleecy care, erect and bold,  
Stalks the proud ram, the father of the fold.”

Sheep are the burden of many of Virgil's themes (B. C. 19); he alludes in some places to woollen thread, and appears to think highly of Tarentum as affording excellent pasture—

“ But if thou herds and steers delight to keep,  
Or goats that burn the corn, or fleecy sheep,  
Seek pleasant groves, and rich Tarentum's coast,  
And plains which woful Mantua bath lost.”

Phædrus, (A. D. 33) in his beautiful fable of the wolf and the lamb, prettily shews how the innocent are oppressed upon groundless pretences; and in his conversation between the dog and the lamb gives us to understand that in his day white sheep were preferred to black, the latter, when occurring in a flock, always being marked out for speedy slaughter.

The Carthaginians are supposed to have been the inventors of that destructive engine, the battering ram, which is inferior only to artillery in the forceful nature of its appeals to masses of masonry, and were, no doubt, led to its discovery by witnessing the fiery assaults made by the males of the flock, one on another, in the way that sails were copied from that ancient mariner, the Nautilus, and the use of frames in tunnel-making from that secret enemy of our wooden walls—the teredo.

The Egyptians were more celebrated for attention to fine linen than the growth of wool, as doubtless the banks of the “father of waters” were better suited for the production of lint than as pasture-ground for so delicate an animal. The attention, however, which they bestowed not on our favourite, was amply compensated for by the Romans, who, from the peasant that rested content with his colourless robe, to the noble who enjoyed in easy splendour his “Tyrian purple,” were passionately addicted to a luxurious envelope of flannel.

The Rev. John Hartley, who travelled as a missionary in Greece, informs us that what is said in John x. and 3d, “The sheep hear His voice, and He calleth His own sheep by name,” expresses correctly the state of the flocks at the present day, it being customary for the shepherds to bestow names on the individuals of the flock, so that any sheep can be readily singled out. Those that have not learned their names are said to be wild. This appears to be the case in Southern Africa, as Burchell remarks the facility with which the Hottentots can distinguish the features of each sheep.

Pennant, after an attentive perusal of the early writers, gives it as his opinion, that this animal was not cultivated among the Britons for the sake of its wool, as the people of the inland parts of this island went either entirely naked, or covered only with skins. The most civilized who, as might be expected, lived only on the coast, affected the manners of the Gauls, and wore, like them, garments of wool termed *brachæ*, from which, doubtless, is derived our unmentionable word *breeches*. It is curious to observe that French toggery was then as fashionable as at present, as he conjectures from there being no mention of manufactures that the

*bloods* of those days received their *brachæ* from the Continent.

In an epistle by one Yuo of Narbona to the Bishop of Bourdeaux (recorded by Mathew Paris, A. D. 1243,) containing the history of an Englishman who lived among the Tartars, we are informed that the Tartar-men leave the care of their flocks entirely to the women (*virî de gregibus aliquantulum habent curam sed venantur*;) and immediately after he adds, “they are truly rich in camels, oxen, goats and sheep,” (*in animalibus valde divites sunt et in camelis et hobus capris et ovibus*.)

A French minorite friar, William de Rubruquis, in his journal kept while in the eastern parts of the world, about A. D. 1253, or ten years after the above mentioned letter was penned, says, concerning the Tartars, “As for sheep and goats they tend and milk them as well the men as the women; with sheep's milk thickened and salted they dress and tan their hides,” (*oves et capras custodiunt maxime et mungunt aliquando viri, aliquando mulieres—de lacte ovium inspissato et salso parant pelles*.) He remarks in chapter 7th, that “the poorer sort of men line their clothes (which were of skins) with cloth, which is made of the finest wool they can pick out; and of the coarser part of the said wool they make felt to cover their houses, their chests, and bedding also; of the same wool, being mixed with one-third part of horse hair, they make all their cordage. They make also of the said felt coverings for their stools, and caps to defend their heads from the weather, for all which purposes they spend a great quantity of their wool.” The women, however, appear to have been fonder of gew-gaw-finery than of the substantial comforts of a woollen garment, though, unlike the refined ladies of the present day, they did not attempt an air of fashion by going in a state of comparative nudity.

Sheep are placed in the class Mammalia, order Ruminantia, and, according to Cuvier, are solitely entitled to a generic separation from the goats, that, with the latter, they produce mongrels capable of reproduction. The species are four, but the varieties are innumerable, as they are only inferior to the dog in liability to vary and to become the accommodating creatures of circumstances. The horns of the sheep are directed backwards, and then incline spirally forwards; the forehead is generally convex, and there is no beard. The great progenitor is supposed to have been the Argali of Siberia (*ovis amon*) an animal inhabiting the mountains of Asia, and attaining the size of a fallow deer. The male has very large horns, with three rounded angles at the base, flattened in front, and striated transversely; the horns of the female are compressed and hook-shaped. The hair is short in Summer, and of a fawn-coloured grey; in Winter it is thick, rigid, and of a reddish grey, with some white about the muzzle, throat, and under the belly. The Mouflon of Sardinia (*ovis musimon*) differs from it only in its inferior size, and in the smallness of the horns of the female.

The Mouflon of America (*ovis montana*) closely resembles the Argali, and is supposed by some to be identical with it, and to have crossed from Asia to America, at Behring's Straits, by means of ice.

The Mouflon of Africa (*ovis tragelaphus*) appears to be a distinct species, and is distinguished by its soft and reddish hair, by its short tail, and by a long mane hanging under the neck, and another at each angle. It inhabits the rocky districts

of Barbary, and has been observed in Egypt. In common with the rest of the ruminating animals, they have eight incisors in the lower jaw, which are unopposed by any in the upper, a callous pad which is substituted being attached to the distal end of the inter-maxillary bones. Between the incisors and molars, or grinding teeth, is a vacant space of about an inch and a-half. There are twenty-four molars, six on each side of each jaw; their crowns are marked with two double crescents, the convexity of which is turned inwards in the upper, and outwards in the lower ones. The ram, ewe, and wether lose the two fore teeth of the under jaw when one year old; six months after they lose the two next to these; and at three years the teeth are all re-placed.

As the Chevrotains or Minks are distinguished with the camels from other animals of this order by the absence of horns, so are sheep, oxen, goats, and antelopes distinguished from the rest of the horned genera of the order, by the persistence of their frontal prolongations. The horn is an elastic sheath of agglutinated hairs, which increases by layers, so that the age of a ram may be discovered by the horns which appear during the first twelve months, though sometimes present at birth, and acquire a ring every succeeding year. The ewes have commonly no horns, but only a protuberance in place of them. The horn is supported by, and serves to cover, a highly vascular prolongation of the frontal bone, and it is at its root, where large vessels and nervous filaments are entering, that blows occasion so great agony to the animal, apart from the damage which the other bones sustain, by the infliction of violence on so powerful a lever. The term ruminating indicates the faculty possessed by this animal, in common with many others, of masticating its food a second time by returning it to the mouth after a short maceration. This they are enabled to do from the structure of the stomachs, or, more correctly speaking, stomach, as most anatomists have now concluded, from all animals being constructed on one common principle, that ruminating animals are not possessed of four stomachs, as formerly supposed, but only of one, which they view as being divided into four compartments. In drawing precise conclusions, we are bound only to admit the existence of two compartments, the other two belonging properly to the gullet, and being equivalent to the crop and membranous stomach of birds, may be viewed as an apparatus designed to serve a nearly similar purpose, while the real stomach will cease to excite wonder, or puzzle the ignorant, on being contrasted with that of other animals, in many of which a division exists, from which even the human stomach, though generally a single sac, is not always exempt, Dr. Knox being in possession of one that resembles a pair of small globes, joined by a narrow tube, and which, when taken from the body of a person who was advanced in life, bore every mark of soundness in texture, and must therefore have been congenital. The food, as every farming person must be well aware, descends, after being partially crushed, into what is called the first stomach or paunch, (in Latin, *rumen*, or *ingluries*), in which cavity are found those morbid concretions so much and so superstitiously prized in the eastern world, under the name of Bezoar stones; from this it passes into the second, termed bonnet, king's hood, or honey-comb, (in Latin, *reticulum*) which is much smaller than the other, and receives its name from the inner coat being arranged into cells; here it is moistened, made into pellets, and

while the animal is at rest, impelled by the anti-peristaltic motion of the tube to the mouth, and after undergoing a complete mastication, is returned through the gullet to the third stomach, or smallest compartment, which goes under the name of omasum, or manyplies, from its resembling a rolled up hedgehog, and sometimes from the longitudinal laminae of its mucous membrane, that of a leaflet. The food remains but a short time in the omasum, proceeding into the fourth division, or abomasum, which, in its structure, especially in that of the mucous, or inner membrane, is nearly allied to the same organ in the human being, and is, by the French, called *caillette*. The last is the largest of the four, as long as the animal continues to live on milk; but the paunch speedily surpasses it in magnitude when grass becomes the sole provision. The milk always passes at once into the third stomach, there being no reason why it should be returned. The intestinal canal is long; there are but few enlargements in the great intestines; and the fat, like that of all ruminating animals, becomes on cooling hard and brittle, forming tallow.

In this climate, ewes fed on good pastures, admit the ram in July or August, but September or October is the time when such would happen, if left to nature. They go with young five months, and in warm climates bring forth twice a-year; but in Britain, France, and most of Europe, they do so only once. They give milk for seven or eight months, live ten or twelve years, and, if well managed, are capable of bringing forth during life, though generally useless for that process at seven or eight. The ram lives from twelve to fourteen years, and becomes unfit for propagating at eight; the male lambs, when not intended for propagating, are emaciated at the fifth or sixth week, and afterwards called wethers, while the term *hog* is applied to sheep two years old.

We come next to the varieties of this animal, than which nothing can be more puzzling, as we are continually liable to be misled on all sides, not so much by the number of the breeds, as by the imperfect accounts which travellers, in general, have hitherto thought fit to gather for our perusal—a circumstance that becomes more remarkable, when we consider that most of them must have left our island fully acquainted with the advantages that would accrue to their countrymen, by a proper attention on their part to what they might witness relating to sheep-husbandry in climates not their own. As it matters little where, in so tangled a web, we date our commencement, we shall begin by describing the sheep of Syria and Barbary. A few lines back we described the Mouflon of Africa, as inhabiting the rocky parts of Barbary, and possessing a mane beneath its neck in this peculiarity approaching to the goat's, but this animal delighting in poor elevated pastures, differs much from its relation of the plains, whose more luxurious feeding has tended to sink some, and heighten others of its original endowments, and render it glorious in the eyes of the South African boors by the magnitude of its tail. The weight and dimensions of this woolly wonder have been much disputed by travellers; we have little doubt but they are all correct in their statements; but why so great a waste of time and labour in arguing about what must necessarily vary much in narrow limits? We may ask,

“What mighty difference can you see  
“Twixt Tweedledum and Tweedledee?”

None in the world; nor would they if they had

chanced to meet at a hospitable table in Southern Africa, with that good old literary beau, the Count de Buffon (the reconciler of their opposite statements) at their head and partake of the object of the dispute, dressed in the many forms in which African ladies alone can disguise it.

Russell, in his Natural History of Aleppo, enters at considerable length into some of the qualities of the African sheep, giving as his opinion, that though Leo Africanus and Symon Simeon saw in Egypt tails, the respective weights of which were eighty and seventy pounds, yet that tails of so great a weight are seldom met with, and when they do occur, are to be ascribed to pampering the animals with bran and barley; the average weight, according to Buffon, who cites many authors, being from twenty to thirty pounds, while according to Pennant, it is fifteen to fifty. The tail is long, hooked up, and excessively loaded with fat, which Burchell states to be of equal value with the carcase, from being manufactured into soap, and the boors informed him it was more profitable to kill their sheep for this purpose, than to sell them to the butcher for a rix dollar, as the alkali required in the process was procured in large quantity from Salsola, a plant of the Goosefoot family. These sheep are, in general, covered with hair, or a kind of fur, which, when dressed, forms a warm clothing. Marvellous in the extreme are the stories we have perused regarding the modes adopted by the shepherds to enable these deformed animals to feed without the risk of injuring their unseemly loads; our readers may perhaps smile, on being told that flat boards have to be fastened to the under surface of the tail, to prevent it trailing on the ground, but we are certain they will laugh outright, on being informed how the simple-hearted Dutchmen of the Cape Colony compel the animal to drag after it a small two-wheeled cart; and the fact cannot be doubted, when we consider the tendency of every thing living in that part of the world, from the simple subject of our tale, to the Hottentot Venus, to become encircled by a zone of pearly fat.

*(To be continued.)*

## TILE DRAINING.

(FROM BELL'S MESSENGER.)

The first point which demands consideration is the duration of the improvement; is it likely to be permanent, or will the time come when it will require to be renewed? To these questions I answer without hesitation that, in case the tiles are made of good clay, properly burnt, and laid down and covered with the precautions suggested in my former communication, there are no assignable limits to the duration of the improvement; that, in my opinion, there is no reason why such drains should not be working as effectually after the lapse of centuries, as on the year in which they are first formed. Of all known substances, especially those which are artificial, tile made of good clay, and well burnt, and placed out of the influence of frost, is amongst the most durable. We have a remarkable instance of this in the Roman villas which are occasionally discovered in various parts of this kingdom; in many of which we find pipes made of burnt clay, for the conveyance of water to and from the baths; which pipes, unless accidentally broken, are almost always in a perfect state

of preservation. Now, since the Romans finally retired from Britain, in the year 414, these pipes cannot have lain in the ground less than fourteen hundred years.

As a further proof of the durability of tile, I may be permitted to state a remarkable fact, of which I myself was an eye-witness. Several years ago, I agreed, with some friends, to search for Roman antiquities in the parish of Chilton-on-Polden, near Bridgwater. In the course of our investigation, we were so fortunate as to discover a large quantity of moulds, formed of tile, or burnt clay, and intended, and most of them had evidently been used, for the purpose of casting Roman coins; the greater part of which moulds were lying within a few inches of the surface of the ground, and barely out of the reach of frost. Though deposited, however, in a situation so unfavourable and perilous, they were still in such a state of preservation as to admit of good casts being made from them in sulphur; the fronts, reverses, and legends of which are nearly as sharp as those of our own coins when just issued from the Mint. The latest of the Roman emperors whose names appear upon these moulds, was Maximin, who died in the year 238; at, or soon after which time, almost 1,600 years ago, the most recent of them must have been made; and it is probable that, during the whole of that long period, they had been lying in the place where we found them.\*

The Romans were remarkable for executing every thing which they undertook in the best and most substantial manner; and the pipes and moulds above-mentioned afford evident proofs of this peculiarity in the character of that wise people. Though formed of common brick clay, the same material as that which is used at present for making draining tiles, it is very apparent that great attention was bestowed by them in selecting the clay, and in afterwards preparing and burning it; and to this, no doubt, may in some measure be ascribed the extraordinary durability of the articles in question. But without reckoning upon so high a degree of attention being given to the manufacturing of our draining tiles, we may venture, I think, to assert, that, on the supposition of their being made with moderate care, they may be expected to last far beyond the longest period of time for which the most anxious landowner would feel it necessary to provide; and, consequently, that tile-draining, when properly executed, may not only be considered as a most valuable improvement, but also as a permanent one in the strictest sense of the term.

This point being ascertained, that the improvement will be permanent, the next consideration is, the expense attending it; and here it is obvious that our views, as to this latter point, namely the estimated expense, will be, and ought to be, much influenced by our opinions respecting the former point, namely, the permanence of the improvement. The same outlay, which may with reason be deemed excessive in effecting an improvement of limited duration,—one which may last for instance only 10, 20, or 30 years, may justly be accounted as trifling, where the improvement shall be almost as lasting as the land itself. With respect to the expense of tile-draining, it is not possible to give an estimate, which may be applicable to the whole kingdom. In the district in which I reside, the expense per

\* A detailed account of this discovery is given in the *Archæologia*, vol. xiv. p. 92.

acre, including every thing except the carriage of the tiles from the brick-yard, I have found to be about 5*l.*; and I have never known an instance of the increased yearly value of an acre so drained to be less than 5*s.*; so that, even at this lowest rate of improvement, there is a permanent interest of 5 per cent. for the money invested, which is more than is usually made by the purchase of land. But in the great majority of cases the improvement is far beyond this. I have a field in my own occupation which was raised at once by this mode of draining, from the value of 15*s.* to that of 30*s.* per acre; and the average improvement per acre in this district may, I think, be fairly estimated at about 10*s.* As this is, as before stated, a strictly permanent improvement, it ought to be made at the expense of the owner of the land, and not of the tenant; but no tenant who understands his own interest, and has witnessed the beneficial effects of it, would hesitate to pay his landlord 5 per cent. during the remainder of his term, upon the money so expended; and, at the renewal of his lease, to increase his rent in a fair proportion to the increased value.

Having represented the expense of tile-draining in this neighbourhood to be about 5*l.* per acre, I subjoin the particulars, which may be of use to such of your readers as may intend to introduce this valuable improvement.

In almost all cases where the ground lies on a declivity, however gradual it may be, the distance between the drains need not be less than 36 feet, which makes the whole length of drains in an acre to be about 1,250 feet. They are usually cut to the depth of two feet, at least; because, if short of that depth, the tiles can scarcely be considered as out of the reach of injury from cattle, stakes being driven into the ground, and other causes. At this depth, the expense of cutting the drain is about 4*d.* per rope of 20 feet, which amounts to about 20*s.* per acre. The cost of the tiles at the brick-yards in Bridgwater is 6*s.* the hundred (that is, reckoning the arched and flats tiles in pairs, and making two hundred pieces), and as each tile is a foot in length, 1, 250 pairs are required for an acre; the cost of which is 3*l.* 15*s.*; so that the total expense for an acre, exclusive of carriage, may be stated as follows:—

	£	s.	d.
Cutting 1,250 feet of drains at 4 <i>d.</i> per rope	1	0	10
1,250 pairs of arched and flat draining-tiles, at 6 <i>s.</i> per hundred	3	15	0
Laying down tiles, filling drains, &c.	0	5	0
	<hr/>		
	5	0	10

N. B. The weight of tiles per acre is about 3½ tons.

A correspondent in a late paper of yours, "R. S. of Worcestershire," gives it as his opinion, that by using cylindrical, instead of arched and flat tiles, one-fourth of the expense may be saved, which, in these times especially, would be a saving well-worth attending to, in case it could be made without endangering the permanence and efficiency of the drains. As your correspondent appears to be a person of considerable experience, it would be very desirable to have the details of his plan laid before the public; particularly whether the tube-tiles have been actually employed to any extent in draining; for how long a time; and how they have succeeded. One objection to them strikes me to be, that there are scarcely sufficient openings for the admission of water to the interior of the tiles. Upon the plan which we follow, the water finds admission along the whole line of junction

on both sides, between the arched and flat tiles (leaving out of the account the transverse junctions); and this line, be it observed, is at the bottom of the drain, precisely where it ought to be. The length of this irregular crevice for the passage of water is two feet to every pair of tiles, or, which is the same thing, to every foot in length of the drain. In the tube-tiles, on the contrary, even supposing them to be three inches in diameter, the circumference, or line of junction, and consequently the crevice for the admission of water, can be but nine inches; and only a small portion of this crevice is on a level with the bottom of the drain. Perhaps, however, your ingenious correspondent has devised some means for obviating this and other objections which may be started, and will probably favour the agricultural world with a further communication.—

Your obedient servant,

June 8, 1836,

P.

### CUSTOMS BETWEEN LANDLORD & TENANT, AND THE INCOMING AND OUTGOING TENANT.

CAMBRIDGSHIRE.

(FROM KENNEDY AND GRAINGER'S CUSTOMS OF COUNTIES.)

A tenant is generally restricted from breaking up pasture land, and from removing either hay or straw from the premises: these are almost the only restraints he is subjected to, being otherwise allowed to farm his land in whatever way best pleases himself.

An outgoing tenant generally harvests his own crop; leaving at old Lady-day, he has time to sow all the spring crop, which he harvests as well as the wheat, and pays no rent after the time of his quitting; he is bound, however, to thresh the corn, and feed the straw upon the premises, by the following Midsummer after harvest: the incomer takes the seeds, fallow and pasture lands, at old Lady-day, but pays the rent for the whole of the land, both that which the outgoer's crop stands upon, and that which he himself takes from old Lady-day. Thus the outgoing tenant having the privilege of taking both the spring and winter crops, without either paying rent for the land they grew upon, or allowing his successor, the incomer, any part of them, the case of the latter becomes a very hard one, he having his first year's rent to make up, without the possibility of obtaining any return whatever for eighteen months; whilst the outgoer is paid for his seeds the value of them, and of the labour, and a certain rate per acre for any ploughing done by him during the winter for fallows; he is bound, however, to leave all the dung, for the benefit of the incomer.

MODE OF FARMING, IMPLEMENTS, &c.—The general system adopted in this county is two crops and a fallow: the fallow land is frequently sown half with wheat and half with barley: the most common rotation is—first, fallow; second, wheat; third, oats; or second, barley; third, beans: in some places wheat is sown on clover-leys and bean-stubbles, but this is very seldom done, either of the former rotations being found more suitable to the land.

The mode of farming in Cambridgshire appears, to strangers, to be extremely singular, and at the

same time to be very inferior to that practised in the adjacent counties. The ploughing here either for making a fallow, or at seed-time, can only be done in one way, that is to say, the land may be turned backwards and forwards in the same direction, but cannot be crossed; thus, in a barley, or other spring season, at seed-time, rushes or grass stand between the ridges in every furrow, frequently knee high: these furrows are commonly and properly called drains, as they are dug out one spit wide, with what may be denominated a whole furrow left on each side.

The land is laid up in ridges from twenty to twenty-four feet in breadth, and very high in the middle, in order that the water may the more rapidly run off; but a water furrow across a piece of land is scarcely ever seen, though it must be obvious that the less surface the water has to run over, the sooner the land will be drained. Were the land to be ploughed in ridges, a fourth or fifth of the size of the present ones, and laid up round, with a few water furrows drawn across, sufficiently deep, the ground would soon become much drier, and, consequently, work very differently in the spring to what it now does. The erroneous nature of the present system is, indeed, so evident, that the wonder is no attempt should be made to alter it, as every one must observe that upon the summit of the ridges the wheat flourishes and looks well, whilst from that point it gradually becomes sickly and yellow, until it reaches the drains, where much of it perishes.

Many of the farmers in this county, upon being asked if the land could not be laid in a different and better manner, reply, that the land in Cambridgeshire cannot be ploughed in the same way that it is in Norfolk, and, of course, there can be no comparison, because the soils are directly opposite in their nature and character; but if they were to look at some of the heavy land in Essex, or Herefordshire, they would then see that their system might easily be altered for the better. As it is, it is difficult to imagine why such a course is continued, unless it be the labour, though that would be comparatively but little, that might be required to put the land into a different shape.

With the exception of the fens, draining, which is so essential to the land in this county, is but very little attended to; and what is done, is chiefly at the expense of the tenant. The drains are principally formed by means of bushes and straw. If, however, only the surface water was to be taken from the land, it would be a vast benefit, and it could be done more effectually by laying the ground in a proper manner with the plough, than merely by draining.

The drill is generally used, as are likewise threshing machines, especially in the fen-lands. In many places a practice prevails of sowing the beans and ploughing them in.

The plough in use has generally one handle, but carries a staff, which is used as a handle, and also for cleaning the plough.

The outbuildings are chiefly of brick, and thatched, and are kept in repair by the landlord.

---

A respectable farmer, residing near Stonehenge, has just sold twenty-three years' clip of wool! He shears annually about one thousand sheep; and we understand that it was so well preserved, that very little of it was damaged.—*Dorset County Chronicle.*

## ON THE CULTURE AND MANAGEMENT OF THE FLAX CROPS.

TO THE EDITOR OF THE IRISH FARMER'S AND GARDENER'S MAGAZINE.

SIR,—As few subjects appear to me more deserving of attention in *The Irish Farmer's and Gardener's Magazine* than an improved system for the culture and management of the Flax Crop, I beg leave to transmit to you the following directions, which have been drawn from the best sources of information; and although the season for sowing has elapsed, it may be well to give the various processes in their order.

1st. The ground should be so prepared during the autumn and winter that it may in the spring be in the best state, and as fine as possible, in order that the seed may be evenly sown. The land should be ploughed as early as convenient in the winter, and if a wet soil, the furrows should be shovelled in the same manner as after wheat is sown; an 18 inch ridge is best in such soil. The ground should not be ploughed again in spring, but should be harrowed as if for clover seed, and sown in the same manner. It should then be rolled immediately, if not very wet, but otherwise, as soon as it is in a fit state. If the ground be not wet or subject to flood, it may be sown flat—and this mode answers best for dry or poor soils. An idea has prevailed, that flax could be cultivated with success after potatoes; but experience has proved that excellent crops may, with proper management, be likewise produced after wheat and oats, and may be generally expected where the ground is good and fresh.

2nd. The seed should be sown as early as it can safely be done. The Dutch commence sowing in February, if circumstances permit. In Ireland, if the ground be in proper order and the season favourable, not a moment after the 1st of April should be lost in getting the seed into the ground. Great ignorance and prejudice have prevailed as to the best kinds of seed. Riga, Dutch, American, and English, all answer well when they have been properly saved. But the Irish cultivator of flax may always have at hand seed equally good, if not superior to any of these, if he will take the trouble of saving the seed. Seed is saved in the Netherlands as a matter of course, and even from the finest flax that is imported into these countries, worth 150*l* and upwards per ton. The best seed is reserved for sowing, and the secondary descriptions for crushing, &c. The flax which obtained the premium from the Royal Dublin Society this year was the produce of Irish flax-seed, without a change of seed for some years. It is advisable, however, to imitate the Dutch also in this respect, and to change the seed every third year. They import Riga for that purpose. The precise quantity of seed should depend on the quality of the soil. Four bushels per Irish acre may be considered as an average quantity. If the ground be very rich and strong 4½ bushels may with advantage be sown; but the quantity should be reduced as low as 3½ bushels per Irish acre for poor land.

3rd. The greatest attention should be given to the weeding of the crop, which should be commenced when the flax is about four inches above the ground. The pains taken in this operation will be amply repaid by the result.

4th. When the seed is perfectly formed and has become of a brownish colour, the flax should be pulled and made into bunches, as much as a man can grasp in one hand; but, in pulling, the hand should not go lower than within sixteen or eighteen inches

of the ground, lest it should take up the short flax with the long. If the flax be suffered to remain beyond the time pointed out for pulling it deteriorates, as the oily properties escape, an indication of which is given by the emission of an odour from the plant.

5th. Six bunches, as described, should be laid on each other, viz.: the first, straight on the ground; the second, aslant across at the root end; the third, in a like slant reversed across the second; the fourth, in a like slant across the third; the fifth, in a like slant across the fourth reversed; and the sixth, straight along the whole to cover it. The seed ends should be towards the sun, and the root ends of all should be together, so as to be raised and to create a slope in order that the rain may run off.

6th. After remaining in this state to dry and harden, four, five, or six days, according as the weather may be, every six bunches of the flax, when dry, should be tied together loosely, in sheaves, taking care to keep that part of the flax outside which was on the ground. Eight sheaves should be formed into a stook, the roots downwards; and the stooks should be ranged in straight files, north and south, in order to have the full advantage of the sun and wind, and that their removal to the ripple or store may be facilitated. In this way it may remain eight, ten, or fourteen days, according to the weather.

7th. When the flax is sufficiently dried, the rippling, or process of taking off the seed should immediately take place. This may be done according to circumstances, in the field, in a barn, or any other convenient place.

The ripple is an iron pin, about sixteen inches long, one inch square at the bottom, and gradually narrowing to the top. Sixteen of these pins should set angularly about one quarter of an inch asunder, in a block of timber four to six inches thick, eighteen inches wide, and sloped at each side, so as to let the boles fall the more readily on the floor, or any canvass sheet, or bag, that may be placed to receive them. In the rippling process great care should be taken to keep the flax even, and not to suffer it to entangle.

8th. The safest mode of preserving the seed is to follow the course pursued in saving clover seed in England, viz.: to form a stack and put the seed in layers on dry straw until it shall be convenient to thresh it. The first layer of straw should be placed on furze bushes, or branches, and the straw raised at least one foot high thereon, before any seed is spread on it. The stack should be completed with alternate layers of straw and seed, and well thatched.

9th. After rippling the steeping process commences—and this is the most important process which flax undergoes, and that which is least understood in Ireland. The steeping pits should be prepared in spring or early in summer, and the water should be kept stagnant therein, in order to soften. They should be seven or eight feet wide, sloping to six feet at the bottom, and from three feet six inches to four feet deep. In their formation or cleansing, a sufficiency of earth or mud should be thrown on the banks at each side, to serve as a covering for the flax, in due time. If the quantity of flax be considerable, it will be found convenient to have a range of pits separated by a narrow bank thus:—

So that the water can be removed by a shoot from the pit wherein the flax is about to be first placed,

into the adjoining one. The flax having, after rippling, been bound into sheaves, each as large as two hands can grasp, the sheaves are to be placed regularly in the steeping pit, (the water having been previously removed therefrom), the root ends of the first sheaf to the end bank, the root ends of the second sheaf on the bands of the first sheaf, the root ends of the third sheaf on the bands of the second sheaf, and so on, the root end of every layer meeting the band of the former one; and all being in an oblique direction. When three layers are completed, a light covering of sedge, grass, or straw should be put on the flax, and not less than four inches of mud on the grass or straw; then the water from the adjoining pit should be let over it by opening the cross bank as far as requisite, until the water having filled the interstices below rises over the mud, when the cross bank which separates the pits should be again made good. The mud should be well plastered, so as completely to exclude the light and air from the flax; and should any leakage subsequently occur, water should be supplied until it again rises over the mud. The proper time for steeping the flax varies from four days, of twenty-four hours, to eight days, according to the quality of the flax, the temperature of the weather, and the properties of the water and mud. The object of steeping is to detach or loosen the flax or bark from the pith or woody part, and the mode of ascertaining whether this is effected or not is, by raising the bark near the root, and also at about six inches therefrom, so as to break the wood in each place; and if the wood can be easily drawn out at the bottom, the steeping process may be considered as completed, and the removal of the flax from the pit should take place without delay.

10th. This operation should be carefully performed with a fork; each bundle should be taken separately and gently immersed in water, to cleanse it from mud, &c., and then placed on the cross bank or side of the pit to drain. After this, the flax should be carried to a meadow recently mown, or to some other convenient place, for spreading. The bundles should be carefully untied, and the flax evenly spread in rows, observing that the inside of the bundle should be now most exposed. The time the flax should remain on the grass depends in a great measure on the weather, and may be estimated at from one week to a fortnight. It is of great importance that the spreading process be well performed, because if the flax be put up in proper order, it will not be necessary to apply any artificial heat to it previous to scutching, which is not only a saving of expense, but a great advantage to the flax, as it thereby retains more of its oily properties. Previous to the removal of the flax from the field to the barn, store, or stack, it should be again made up into bundles of a convenient size—in this as in the other operations, particular care should be taken to keep the ends of the flax even.

The last process which flax undergoes previous to its becoming a marketable commodity is scutching, which is in Ireland performed either by the hand or at a scutching-mill. It is generally supposed here, that scutching can be best performed at a mill. But this is a mistaken notion. In reply to frequent inquiries, as to whether there were any scutch mills in the Netherlands, the answer has been, that there are none; and yet such is the admirable skill and attention of the industrious inhabitants, that they break, scutch, and prepare by manual labour flax, some of which in its undressed state they sell for upwards of two hundred pounds per ton.

As the directions I have submitted for the management of the flax crop differ in many respects so ma-

terially from the practice in this country, it appears desirable to exemplify the success that has attended the mode of treatment recommended in this letter, and I have permission to refer to Edward Wolstenholme, Esq., of Newberry Hall, Edenderry, who has had the kindness to furnish me with the following result of his experiment of last year—and to make several valuable practical suggestions on the subject.

Mr. Wolstenholme sowed early in April last year, fifteen Irish acres with Dutch seed of excellent quality, purchased from Messrs. Toole and Co., four bushels to the Irish acre. These fifteen acres produce 345 bushels of excellent seed, which were sold to average 7s 6d per bushel, making ..... £129 7s 6d

He has in flax produce,  
 already scutched .... 850 st. of 14lbs.  
 To scutch, at least.... 200 " "

1050 stone.

Or, 6 tons 11 cwt. 1 qr.  
 for which he has been  
 offered £60 per ton,  
 amounting to ..... 393 15 0

Being for the fifteen Irish  
 acres ..... 523 2 6

Or, per acre, ..... 34 17 6

The average value of Irish flax may be at present estimated at from £45 to £50 per ton—so that instead of the flax having been injured by the saving of the seed, the crop has, by good management, produced an article exceeding in value from 20 to 33½ per cent. beyond the average of the country.

Mr. Wolstenholme has this year sown forty Irish acres with flax, viz., thirty-five acres with seed of his own saving.

- 2 with Riga.
- 3 with Dutch.

The seed of his own saving was sown three or four days after the foreign, but came up before it, a much stronger plant and thicker in the ground, although the same quantity of each was sown—and to this moment promises to be a superior crop.

Computing that 100,000 Irish acres are sown, and that the crop of seed be but twenty bushels per acre, and the price only 6s for crushing, still the value of the seed crop would be £600,000—and if the crop of flax on 100,000 acres yielded only 7 cwt. per acre, or 35,000 tons.

This quantity at £45 would be £1,575,000

At £50 ..... 1,750,000

And, therefore, the increased value, if at £60, by superior management, would be a further gain of from £350,000 to £525,000, thus making on the crop an annual increase of income of one million or upwards from the flax crop in its present limited extent! But there can be little doubt that the increased stimulus which would be thus given by the advantageous results of improved management in the cultivation of flax would greatly extend its growth over the south and west of Ireland, where the soil is in many places admirably adapted for it; and as it has been clearly ascertained that flax is not an impoverishing crop, and, moreover, is peculiarly suited for laying down ground with clover, it does not appear unreasonable to suppose, that the extent of land under it in this country may be more than doubled, and the national advantages derived therefrom proportionably increased.

It appears, in fact, but necessary that other landed proprietors should follow the example of the estimable and intelligent gentleman who has been referred to, and who assured the writer that he would have much pleasure in giving every information on the subject to those at a distance who might desire it; he has already kindly afforded persons in the neighbourhood the means of profiting by his example. Ireland, from the climate, soil, the abundance of water she enjoys, and the extent of her population is probably better adapted than any other country for the cultivation of flax and the successful prosecution of the linen trade. If her sons do but their duty she cannot but take the lead of all other nations in this important manufacture.

Dublin, 24th May, 1836.

### ON PRUNING THE NUT TREE.

It may be matter of wonder, but so it happens, that the generality of gardeners know little or nothing about pruning filbert trees. The art has never been studied either by masters or men; and it is remarkable that this branch of the pruner's art should have been brought to perfection by the untaught, unlettered, Kentish peasant—without books—without master, save experience—without mistress, save Nature herself! It is curious, too, that this art has been engrossed by the labourers in the central parts of the county, and without it being practised in other parts of the kingdom. All that has been written and published on this subject is but of little value, as more information may be gained in a visit of one hour to the fields round Maidstone, than can be gleaned from books in an age.

The principle of the Maidstone pruners appears to be this:—to check and controul the natural growth, and thereby bring forth the fruit-bearing principle in greater force and energy. After training the tree in a dwarfed form, they allow it to expend its strength in no other way than in the production of flowers and fruit. The filbert is naturally only a shrub or small tree, and the cultivator, makes it still less for his convenience in pruning and in gathering the fruit. That style of pruning, which is found the best for the currant, is also the best for the filbert.

The young plants chosen by the Maidstone growers are such as have been raised from layers, and which have been lined or bedded out in the nursery for two or three years. The plants should have one strong upright shoot, of not less than three feet in height, this being necessary in order to the future form of the head: this, early in the spring, after the trees have been put out in their final stations, is cut down to about eighteen inches from the ground. This height will admit of a clear stem of twelve inches below, and which part must at first, and ever afterwards, be kept free from shoots, as well as suckers from the roots. This deprivation of shoots and suckers, will cause the buds left at the top to shoot with greater vigour. If eight strong shoots be produced in the first summer, they must be carefully preserved, as that number is required to form the head; but if less than this number come forth, then two or three of the strongest, (or the whole if necessary,) must be shortened back to half their length at the

next pruning, in order to obtain the requisite number.

The full number of branches being obtained, if not in the first, certainly after the second pruning, they are carefully preserved, and trained outwards and upwards; at first nearly horizontal but curving gradually upwards. The easiest mode of doing this is by using a hoop of proper size placed within the shoots, and to which the latter are tied in star-like order, and at equal twelve-inch distances. Such a latterly curving position may be much assisted and caused by the pruner always cutting at an outside bud, which naturally grows first outwards and then upward, and continued to the height of six feet, but never higher; and the middle of the tree is, in the mean time, kept free from shoots and branches, so that a well-trained head becomes at last like a large bowl or basin.

The subsequent management of the trees, both while gaining the desired form, and after having gained it, consists in preserving all the short spurs produced on the branches, and cutting or shortening the small lateral shoots, which every year rise from the same. The management of these laterals is of great importance. If they exceed the length of six inches, they may be cut back to a few buds; but if less, they should be preserved entire, as their points are generally fruitful. The special object of the pruner is to have the branches thickly beset with fruitful spurs, and which are only reduced in length, when, after a few years' growth, they become too distant from the branch, when they are pruned back to a healthy spur at their base. If any part of a branch become accidentally naked, a strong shoot from the bottom may be led up, and managed so as to fill the vacancy.

When filbert trees are thus managed, and have arrived at their full volume in width and height, they may be kept in the same state for many years—say twenty or thirty—by the knife only, and with the requisite skill in using it.

The plantations of filberts in Kent are either in single rows, or occupy entire quarters of fields. The trees are put in at eight or ten feet distances, more or less, according to the quality of the soil. Six hundred and eighty plants are required for an acre, at eight feet distances each way: at ten feet distances, four hundred and thirty-five: and at twelve-foot distances, three hundred and two trees will be required.

The Kentish pruners are well aware of the use of the male catkins, rejoicing to see them plentiful, and carefully preserving them. From the greater or lesser number of the catkins, they can pretty certainly predict what share of crop will follow.

The practical example set us by the Maidstone pruners, confirms two very essential principles in the art of gardening, viz:—that by counteracting the natural tendencies of a plant, it may be dwarfed, and by thus dwarfing, making it more fruitful. The filbert tree is so constituted that it is ever extending itself by throwing up a multitude of suckers, which exhaust the bearing branches and render them sterile; but denying the plant its tendency to increase itself by suckers, promotes its energy to increase itself by seed.

Filberts intended for long keeping, should remain on the tree till they are thoroughly ripe, which is indicated by the rich brown colour of the nut. They should be laid on a dry floor for a few days, and afterwards stored in jars of dry sand, where they will keep sound for a great length of time.—*Rogers's Fruit Cultivator.*

## ON CULTIVATING WASTE LANDS; AND THE SUPERIOR ADVANTAGES OF SMALL FARMS.

(TO THE EDITOR OF THE CHELMSFORD CHRONICLE.)

SIR.—Your insertion in a recent number of your Journal, of the article to which I requested your attention, "On the Superior Advantages of Small Farms," has induced me to trouble you with a letter on a subject closely connected with my former communication. I assume that it is of great consequence, both to individuals and to the community, that landlords should be aware of the great gain they will derive from the whole of their waste lands being brought into cultivation. The objection hitherto alleged is the fear that such a course would multiply the population to a dangerous extent; but supposing this cultivation of the waste lands were to produce this effect, is it expedient that the present generation should be deprived of the means of subsistence from a fear that a future generation might be placed in the same circumstances? But it may be fairly disputed whether the population would be increased; for there are abundant proofs both in England and, especially, in Ireland, that poverty does not diminish population; on the contrary, the earliest marriages usually take place where there are the least means of supporting a family; and that the disinclination for imprudent marriages seems to be in proportion to the means of comfort possessed by the individuals. But suppose population to be increased, what have we to fear, till all the waste lands in England, Scotland, and Ireland, not now worth sixpence an acre, are divided into five acre farms; which would admit of our population being doubled without any fear of its being increased beyond the means of supply; this would also tend to reduce the poor rates more than any plan which has yet engaged the attention of the Legislature.

It requires no prophet to predict, that in England landlords must lower their rents, or divide their farms. In large farms the following causes tend to diminish the rent, by lessening the proceeds of the farmer.

1. The distance of the fields from the homestead occasions an amazing increase of labour in carting out manure, and bringing home produce.
2. An extensive farmer must perform the whole work of his farm by hired labourers.
3. The large farmer must live in a superior style.
4. As he employs a large capital, he must have a return for that capital, as well as be repaid his outgoings.

Now, as all these are reduced, so the proportion which they bear to the produce is charged to the benefit of the small farmer. As farms diminish in size, the labour of the occupier and his family becomes available, till it is reduced to the size that the occupier and his family can do all the work of the farm; and it will be found that the means of such a man to meet the rent, &c., may be depended on more than any other class of cultivators; because a man working for himself will do twice as much work in the same space of time that he can obtain for hire; while his wife and daughters can manage the dairy and feed the cattle. Why then should not landlords so divide their farms as to obtain the highest rents? Another disadvantage to the landlord resulting from large farms is the great expense to which they are frequently put by extensive dilapidations, if the tenant (as is frequently the case) has neglected the repairs; while small tenants under lease readily build and keep in repair their own houses, and sheds and

stables for the cattle and horses. If the farms were reduced in size, a robust peasantry, "their country's pride" would again form the strength and boast of Great Britain; and absentees would return to their estates, to occupy the houses of their ancestors, now ceded to their tenants.

With respect to the cultivation of waste lands, it has been doubted whether Parliament has a right to interfere, and to take (after making the owners compensation) possession of those lands which the proprietors have left in a state of nature. But the Legislature may throw down my house to widen a street; or make a road or a canal through my field or garden; or take a twentieth or a tenth, or any other proportion, of my income, in taxes, and no one dreams of disputing the right; the only question raised is as to the expediency. Why then should any land lay waste that the public good requires for the pauper population? Why should the country be impoverished by poor rates, when the poor might be enabled to provide for themselves? But though I assert the right of the Legislature to interfere, I do not imagine it would be often called to exercise that right. If the attention of the landlords were called to the subject, they would, I think, readily concur in promoting it; and the agricultural labourer thus having employment on his own land, would have no occasion to emigrate for a subsistence.

In my opinion there has been a greater outcry respecting the ruinous amount of the poor rates in agricultural districts than the fact has justified. Where the rates have increased during the existence of a long lease, there the tenants have been injured; but to a yearly tenant, rates, tithes, and taxes are all taken into the account in the amount of rent agreed to be paid for the land; and while competition exists the land will always let for its worth. By dividing the large farms, I repeat, the produce of the land would be increased, and the cost of production would be diminished, and by the annihilation of the poor rates, which would be nearly effected by the plan I recommend, the country would be relieved from an expense equal to two-thirds of the whole naval and military establishments; while the public revenue would be so increased by the general prosperity, that many of the present government taxes might be reduced or abolished.

A FARMER OF THE OLD SCHOOL.

*Tending Hundred, May 24.*

## AGRICULTURAL SOCIETIES, No. 3.

TO THE EDITOR OF THE YORKSHIRE GAZETTE.

SIR,—There are some agricultural societies which are entirely of a political character. I am not alluding to those bearing the titles of "Agricultural and Conservative," or "Agricultural and Liberal," but such as are supported by men of all political creeds, but having no bond of union,—no object beyond that of watching over the political interests of agriculture. When a steady and careful eye is kept by societies on the proceedings affecting their interests, in conjunction with the distributing of prizes, and the formation of libraries and journals, it is quite unexceptionable if formed on proper principles, but without this step they are generally inefficient or inoperative. When a mere political tie exists, there is nothing to arouse the dormant energies,—no exertants to activity, or co-operation exist, where the dull routine of employment consists in petitioning, meet-

ing, and dining; such societies are never calculated to be generally supported by the farmers, and, saving the influence and attraction of a few gentlemen, and landowners, by whom they are generally led, they are existing only in name,—are almost inefficient, and in some places wholly defunct. They tend to heighten and perpetuate that erroneous and destructive feeling amongst the tenant farmers, that the interests of landowners and occupiers are distinct and separate, and thus in some respects really weaken the agricultural body.

The only plan for giving real usefulness, permanency and stability to such societies is to incorporate them with the distributing of prizes and the dissemination of agricultural intelligence; for if some stimulant to exertion is not adopted, a few years will witness their dissolution.

Some, however, object to associations of this nature upon principle. They term them political unions, and to a certain extent they are; but they are no more likely to become dangerous to the interests of any portion of the community than they are to destroy the efficacy of tillage, or disarrange the rotation of crops. Political unions are only to be deprecated when they are intended—or when they attempt to overawe the deliberations of the legislature or interfere with the public peace and security, or personal liberty or property.

The agriculturists, as a body, never will attempt to overawe the legislature,—it is not in their nature. Their wide diffusion,—their occupations,—their character, all forbid the remotest idea of the kind;—they never can become a really formidable body in the state, further than the influence of their property renders them legitimately powerful. Their loyal and patient character for many years, seems to be a warrant for their future good conduct, for, while the traders and manufacturers have been up in arms to demand any redress of grievances, fancied or real, the farmers have borne all manner of insults, scorn, and neglect, with all the patience and forbearance of patriots and christians. They doubtless, then, have a right to associate, and watch over their interests,—to petition,—to express their wants and feelings, and to claim the protection which is due to them as the main-spring of our wealth and prosperity, and the stability,—the source of national independence and security,—provided they do it in a manner peaceable and constitutional;—not the bullying of numbers in arms,—not threatening rebellion,—blood and fire,—but to ask for as much redress as the legislature can afford, consistent with public credit.

With respect to the organization of these societies, it is necessary that they should have a calm, influential, and respected leader,—secretaries of talent and standing, and an active, working committee of farmers. The expenses of the society should be maintained by voluntary contributions, and the landowners are the persons who should be expected to defray the pecuniary expenses of the society, considering that if the labouring farmers give their influence it is as much as they can expect. If a certain subscription is a test of membership, it will both act in an exclusive manner, and damp the exertions of the society, by demanding payments for which they see no adequate return. There is no security in a money payment,—such an influx of free traders might be the result as to nullify the object of the society, and thus produce an evil it was intended to remedy. I think this is best obviated, and unity of purpose secured, by having a pledge for every person to sign on be-

coming a member;—first expressive of a conviction of the importance of agriculture,—the necessity of a fair protection from the foreign untaxed competition,—of readiness to co-operate with and aid all plans, introduced by whomsoever they may, which are really calculated to relieve or improve the agricultural interest, and of abstaining from all party political topics and discussions. Without this there is no certainty of any unanimity, (the soul of all moral force,) either amongst the individual members, or the various societies.

The central society is a most desirable institution, and provided its proceedings are moderate, firm, and well arranged, it will form such a nucleus to the agricultural body as will give it its due preponderance in the eyes of the country, and all the societies should unite with it, and express their opinions on the various interesting topics under discussion. Among other salutary recommendations of that society, I am glad that the adoption of the moderate size farm system is one, which although it has called down the ire of some interested persons will be duly appreciated by the farmers, whose eyes are more and more open every day, to the destructive and horrible effects of the farm monopoly. In conclusion, I would recommend most strongly, the attention of the central committee to the diffusion of agricultural information, in a very cheap form, and suited to the capacities of farmers, for which their extensive connexion with practical men, and local societies give them extraordinary facilities. W. E. N.

#### NATURAL HISTORY OF THE CHEESE MITE, OR JUMPER.

A small white fleshy grub of an elongated form, often found in decayed cheese, and which is the larva of a pretty two-winged fly, known by the systematic name of *Piophilæ casei*. Of this insect the immortal Swammerdam has left us an interesting account; and though to unthinking persons it may appear to be a frivolous subject of inquiry, we find the illustrious philosopher affirming "that the limbs and other parts of this worm are so uncommon and elegant, and contrived with so much art and design, that it is impossible not to acknowledge them the work of infinite power and wisdom, to which nothing is hid, nothing impossible." It has been a common error that these insects were bred spontaneously from the cheese, and epicures accordingly do not hesitate to eat them with great gout, thinking them formed from the very best of the cheese, whereas they are produced from eggs deposited therein by the parent fly. These larva are long, cylindrical, and composed of twelve rings, the first of which is furnished with two small bent hooks of a black colour, which serve not only as teeth, but for feet also, the insect having no other organs employed as legs. The terminal segment of the body is covered with a variety of prominent tubercles and little cavities like wrinkles, of which we will presently see the use. When this larva prepares to leap, it first erects itself on its anus, in doing which it is greatly assisted by the prominent tubercles of the terminal ring, which enable it to maintain an equilibrium. It then bends itself into a circle, and having brought the head towards the tail, it stretches out the two hooks of the mouth, fixing them into the two cavities at the extremity of the body. It then contracts the body from a circular

to an oblong figure, the contraction extending in a manner to every part of the body. It now suddenly, and with great violence lets go its hold, and the elastic force of the body returning to its natural position, produces a leap to a considerable height and distance, at least twenty-four times greater than the length of its own body. Here we cannot but admire the powers given by nature to different creatures, and their limitations, to answer different purposes, and not for mischief to mankind. If, for instance, a power of motion, proportionally equal to that possessed by this insect, had been given to the serpent tribes, how much more terrible would they not have been rendered, than with their present capabilities? A viper would throw itself nearly a hundred feet upon the traveller, and the rattle-snake several hundred.

Swammerdam, after giving a minute account of the external and internal anatomy of this creature, observes, "now let the sharpest geniuses, and men of the greatest penetration and learning, judge if a creature, on the fabric of which there plainly appears so much art, order, contrivance, and wisdom, nay, in which is seen the hand itself of the omnipotent God, could possibly be the production of chance or rottenness? The female fly is provided at the extremity of the body with a very fine retractile borer or ovipositer, wherewith she pierces the cheese and at the same time deposits her eggs in the wound thus made. Shortly afterwards the grubs are hatched, and feeding upon the cheese cause it to decay: the fine powder which we perceive, and which is so highly prized by the gourmand, being nothing else but the excrement of these grubs, which, when they have attained their full size, desert the cheese, and in three or four days they lose all motion, grow stiff, become hard, and contract their bodies into an oval mass not more than half their previous length, within which the real pupa is inclosed; this insect undergoing the coarctate kind of metamorphosis, like the majority of two-winged insects. After remaining some time in this state, the chrysalis becomes of a black colour, and the enclosed nymph breaks that part of the outer covering which defends its head into two parts, and at the same time throws off from every part of the body a thin and slight membrane which it leaves within the old case. At first the wings are scarcely perceivable, the insect, however, runs abroad very quickly, and shortly afterwards the wings are by degrees extended into full length, when the insect is fitted for pursuing its duties, which almost entirely consist in the reproduction of the species. The fly is about the size of the grub, of a shining blackish green colour, the wings transparent and shining, and the legs varied with ochreous and black.—*British Cyclopaedia*.

EFFECT OF WATER ON CAST-IRON.—Some large brass and cast-iron guns, which went down with the Royal George in 1782, are now lying in the Tower. The brass ones are little affected by their long immersion in the sea, but those of cast-iron are changed throughout their whole substance. They resemble plumbago or pencil-lead, and, like it, may be easily cut with a knife.—Cast-iron pipes attached to a pumping-apparatus, in a mine 140 fathoms deep, in the north of England, have been so softened in five years, as scarcely to hold together on removal.

## ENGLISH TITHE BILL.

TO THE EDITOR OF THE TIMES.

SIR,—I beg leave to offer through your paper a mode by which the commutation of tithes for a money payment may very easily be effected, and has the recommendation of being founded on the acknowledged principle of the quantities of land generally considered as a compensation in lieu of tithe under almost every enclosure act, where tithe is commuted for land—namely, one-fifth of arable land and one-ninth of pasture and other kinds of land; but instead of land, to give a money payment calculated at an equivalent annual payment for such quantities of land by substituting one-fourth of the amount (but not as part) of the rent paid for arable land, and one-eighth of the amount of the rent paid for the pasture or other land, to be paid by the tenant or cultivator.

The present bill (I allude only to the English bill,) proposes to give a rent-charge, to which I think there is the greatest objection. In the first place, a rent-charge is not in the nature or character of tithe; and next, instead of being an alleviation of the burden of tithe upon land, and the operation of it against improvement of cultivation and agriculture, and improvement of stock, I consider it will be in the end a more onerous and objectionable charge.

As a permanent and fixed charge upon the land of the value of a certain given number of bushels of corn, it will not alter with, or make allowance for, the state of culture or quantity of produce; or allow for land being thrown out of culture, or bad husbandry or bad seasons, and will, under circumstances of very common occurrence, press so heavily on the occupier or cultivator, that finally its onerous nature will be such as to defeat the object.

On the objectionable nature of a rent-charge, I beg leave to observe, that the effect and object of a rent-charge is to give a hold on the land, and that beyond the period that the person from whom the tithe is due holds the land, and thus in case of arrears throwing the burden on the succeeding tenant or cultivator. It is fair and reasonable that the tenant or cultivator shall be answerable for his own arrears of tithe, or money payment in lieu; and whilst he occupies the land his property and interest is in that land, and his estate shall be liable to his debt. But it is not reasonable that his successor shall be so liable for him; or that land should be liable for a prior tenant's arrears, or debt, beyond his occupancy; or that the land should lie uncultivated rather than pay his debt; or that the proprietor of the land should be compelled to sell his land for the debts of his tenant: and one of these cases must happen in arrears of so heavy a rent-charge as tithe would be.

As if aware of the objectionable nature of a rent-charge, it is proposed by the bill that more than two years' arrears shall not be recoverable; but this, I apprehend, would be quite enough to defeat husbandry, or the cultivation of the soil: as with two years' arrears left by an outgoing tenant, and the accruing payment of a third year's tithe, few persons would be found to venture on cultivating the land or to stock it so encumbered. Much more may be urged as against the tithe commutation being in the nature of a rent-charge, but enough is shown to exhibit that it is unreasonable, as well as the very prejudicial and objectionable nature of such a mode.

I consider that in substituting a money payment in lieu of tithe it is not meant by any blind or device to give a greater advantage to the tithe owner, and impose a charge that shall be more oppressive to the occupier or prejudicial to cultivation of the land; but that the real intention is to give as fair an equivalent as practicable, and to substitute a reasonable consideration for tithe, where that would and does operate as an unreasonable charge upon land, as in cases of great outlay, and disbursement of capital in high states of agriculture, and rearing of fine stock, or in cases of bringing poor or bad land, or unreclaimed land, into a good state of cultivation; and further, to give a more easy mode of obtaining payment to the titheowner, and a less objectionable mode of collecting his dues than in the form of taking tithe in kind.

I believe it to be the sentiment of the clergy generally, and who, with the establishment are the objects of chief consideration in the proposed commutation, that they wish no undue advantage, but a fair and reasonable equivalent for their tithe, subject to the vicissitudes of the products from the land.

These premises admitted, a payment that shall be modelled as near the nature of tithe will be that which shall follow the nature of the produce of the land, and make all allowances for soil, mode of cultivation, and kind of produce; and which a payment calculated by a proportion of amount of rent (but not as part of it,) because governed by the different kinds of produce and cultivation, obviously will effect, and is therefore the mode proposed of regulating the tithe payment.

The rent, therefore, under this view, apparently affords a very ready and appropriate means of settling the amount of tithe payment. Where rents were fair or admitted as such, both by the titheowner and farmer, it might save much time, trouble, and expense in valuation; but it may be necessary to have recourse to a survey, and therefore to provide for it; and where a rent is not considered to be the fair amount, either at too much or too little, or even without reference to rent paid, the value of a rent may be settled by a survey according to the state and condition of the land, the nature of cultivation, as to being arable, pasture, or other quality. The survey to be made by a surveyor for the cultivator, and a surveyor named by the titheowner, and an umpire, at the expense of the parties; and this should be made compulsory, with power to the titheowner to name his own man, if the cultivator would not, who should proceed, and whose decision should be binding; who shall then estimate the quantity of arable and pasture, and other land, and apportion the rent for each kind, and the payment in lieu of tithe would be one-fourth of that apportioned for the arable, and one-eighth of that apportioned for the pasture, &c. The proportions of arable and pasture, and other land, and the proportion of rent for each, shall remain as long as parties agree, or who may agree to alterations as required from time to time; but if they cannot agree, or if they see reason to have a new survey, then surveyors to be appointed as before. As a general rule, the tithe payment always to be considered first according to the actual rent paid, but if disputed, then as surveyors shall fix, and remain till parties shall object, and then to be settled as before provided, and so on from time to time. In cases where the landlord occupied his own land, this is provided for by a survey to fix the rent, should not the titheowner and landlord be able to agree

between themselves in the amount—the tithe to be recoverable in that case of the landlord as rent would be, but no arrear to extend to the land beyond the landlord's occupancy.

It appears to me that the fair method would be, that the tithewowner, as to right and title, should be left precisely as he is in all respects, except that he should be entitled to the substitute of the money payment at certain regulated periods quarterly, instead of taking the produce in kind, unless for arrears; for security of which he should have powers of distress as against the occupier; but for arrears incurred by the occupier only, against whom (ceasing to have an interest in the land) his arrears should remain a debt; and the tithewowner should have a precedence in the claim for his money payment, and for arrears, as a debt of tithe over rent, and all other debts not settled.

I will add, that by the mode proposed in my observations all the machinery of the present bill would be avoided, and an act little more than so much of an enclosure act, that provides for the commutation of tithe for land, substituting a money payment in place of the latter, would accomplish the object. AMICUS CLERICORUM.

June 2.

**BREAD.**—Although the fermentation of bread is attended with considerable advantages, yet it involves an extra degree of care, as to the bread being very thoroughly baked; and it renders it almost necessary that it be kept for a day or two before it is eaten. If not thoroughly baked, not only does part of it remain in the state of dough, viscid and tenacious, but ill suited to the powers of the stomach—a substance in fact that will disagree with almost any stomach, however strong, as it has not completely got rid of its fermenting ingredients, and the process will probably be continued in the stomach, to the obvious disturbance of its functions. The same thing is to a smaller extent, the case with new bread. The crust and the part of the bread next to it are much more easily digested than the inner part of the loaf; because from the former the products of fermentation have been the most completely expelled. Burnt bread is, however, neither more nor less than charcoal, and is deprived of all its power of affording nourishment to the system.—We have, then, several good reasons for saying to our readers, let your bread be baked in small loaves. One of these reasons is, that such bread is more entirely freed from the products of fermentation: they must escape much more completely from a small loaf than from a larger one. There is, in the second place, less necessity for putting the bread into a very hot oven, or for continuing it in the oven so long as to deprive the outer part of its nutritious particles. Such bread is sweeter to the taste than bread made in large loaves, because it is more entirely freed from the products of fermentation; and for the same reason it is more digestible. Looking upon this matter in a pecuniary point of view, we would maintain that what we are advising is worthy of attention on the score of economy. We would contend, that from any given number of pounds of flour, baked in small loaves, a larger quantity of nourishing matter will be obtained than if it be baked in large loaves; while the bread will be both more palatable and more wholesome.—*Magazine of Health for May.*

**OLD TREES.**—Mr. Jesse, in a letter to the *Gentleman's Magazine*, says, "that there are yew trees in England as old or older than the introduction of Christianity in our island, no doubt can exist; the oak is probably of an age little inferior; and the Tortworth chesnut, if it were, as is believed, an old tree, in the time of King John, may be approaching to a similar date."

## CULTURE OF THE COMMON APPLE.

The successful culture of apple trees depends very much on the suitability of the ground they are planted in. The size and flavour of the fruit, the general health and duration of trees, are most commonly the result of good or bad soil. Climate and situation also affect both trees and fruit; but not in the degree in which the same are affected by the qualities predominant in the land. Of all the different descriptions of soil to be met with in these kingdoms, that of a soft hazel loam, containing a small portion of sand, seems to be the most congenial to the apple generally. In such soil the tree is seen to flourish longest, is most productive, and remains freest from disease or attack of insects. A great depth is now requisite; eighteen or twenty inches being quite enough, provided it be on a dry subsoil of chalk or loose rock. If the bottom be wet, the trees should be planted high, and every means taken to drain the ground. A wet bottom of gravelly clay should be avoided if possible—no kind of apple thriving long if the roots once enter such a cold substratum.

Deep rich soils in sheltered situations are not the most proper for the apple, though such have been most erroneously recommended by writers who ought to have known better. For it is often seen that apple trees succeed in any kind of loam, though it be no more than one foot in depth, so as the bottom is sound and dry; they prosper because the roots take an extensive horizontal range; the young wood is always of a more moderate growth, and better ripened than where the roots strike deep into the ground.

Although local circumstances often controul the wishes of the planter, compelling him to fix on a site where the soil may not be exactly like what is recommended above; he must, in this case, endeavour to make the soil by trenching, draining, and by addition of the qualities wanting, and bring it as near to the standard as possible.

The situation of an orchard should neither be in the bottom of a narrow valley, nor on the top of a hill: in the first, the bearing wood is never so well ripened, the buds are often too early excited in the spring, and there frosts are always more intensely felt; in the second, fruit-bearing trees are always too much exposed to winds. The most desirable site is the side of a hill which slopes gently to the south or south-east. If higher ground or a belt of forest trees bound it on the north, it is an advantage, as yielding shelter often necessary to break the cutting winds of March and April. A western aspect is not to be preferred, because of the violent gales often experienced from that quarter; more especially during the month of March, when the buds are swelling, and in September, when many of the trees are laden with fruit. If, however, a western slope be the only choice, (other circumstances of the soil, &c. being favourable,) the planter has only to take care that the fruit trees be protected by screens of forest trees on the exposed points. This may be done, in a great measure, by the fruit trees themselves, that is, by planting the hardiest kinds, and tallest growers, on the north or windward sides; and placing the more delicate and lower growers towards the south.

Apple trees are liable to disease, and are also the prey of insects. Canker is the most prevalent disease; and appears to be caused by impure qualities taken in by the root from an ungenial subsoil. This is a conclusion come to from experience; because in low damp situations, where

the subsoil is strong gravelly clay, there the trees are mostly cankered; while the same kinds, planted on a light loam, having a dry bottom of rock or chalk, remain perfectly free from disease. We cannot exactly say how this happens, or describe what the deleterious qualities are, which derange and destroy the healthy bark and wood of a tree; but knowing what is above stated to be a fact, all we can do to prevent it, is, to avoid placing trees in such situations, or if our land be of that unfavourable kind, endeavouring to improve it by draining, or by any means that will prevent the roots descending into the noxious subsoil.

Insects hurtful to the apple tree are the *American coccus*, or woolly aphid. This is too well known to need further description. To kill those that are visible, and stop the young from infesting the whole tree, make a wash of soft soap and warm soft water, worked together till of the consistence of thin paint. This must be laid on the stem and branches with painters' brushes of various sizes, and pressed into every chink or opening of the bark where the insects hide and breed. The action of the brush crushes the old ones to death, and the clammy nature of the wash prevents all movement of either old or young. One application will not be enough to extirpate them, because many of the young are safe, and lie hidden under blisters of the bark, which, unless first paired off with a knife, neither brush nor wash can reach. But if this wash be applied hot, and as often as insects appear, a tree, or any number of trees, may be cleared of them in time.

**CATERPILLARS.**—Of these there are many different kinds, which prey either on the buds, leaves, flowers, or fruit of the apple tree. They are mostly the larvæ of moths, the eggs of which are laid in the crevices of the bark or round the buds, in the autumn or spring, and on the approach of warm weather are hatched, eat their way into the buds, and often devour both leaves and flowers. There is no way of keeping trees free from these winged insects, unless we could wash or sprinkle the whole tree in the autumn, with some liquid which would be offensive to the parent insect. Fumigating the orchard with heaps of burning haulm or straw sprinkled with sulphur, in the autumn, is said to taint the trees, and so drives the female insects from nesting on them. So effectual is this expedient deemed in Normandy, that it is never omitted by the orchardists there.

Parasite plants affecting apple trees, are the rust, mildew, misletoe, lichen, moss, &c. The three last are got rid of by any cutting or scraping tool. Rust and mildew are both funguses, which are easily killed by strong soap-suds repeatedly applied to the parts affected, or by sprinkling when wet with flour of brimstone alone or mixed in soap-suds.—*Rogers's Fruit Cultivator.*

**A BOON TO THE AGRICULTURISTS.**—There were reported at the Custom-house, London, on the 9th of April last, by the ship Commercial Packet, J. Hart, from Rotterdam, 500 cases of Geneva, consigned to order.

On the 11th of April last, by the London Merchant, Captain Stranach, from Rotterdam,

100 cases of Geneva, consigned to order.	
100	Ruck, Son, and Co.
170	G. Trimby.

These cases contain 1 dozen bottles, in quantity 2½ gallons, which is sold (in bond,) including bottles, package, &c (the spirit being at proof,) for 8s 6d.

Others contain 15 bottles, in quantity 4½ gallons, and are sold in like manner for 13s.

It is also imported in casks, and sold at 2s 2d per gallon, in bond.

The official returns show that many thousand gallons, of the above description, are imported weekly.

The Warehousing Act, 3d and 4th Will IV, cap 57, allows this article to be tasted, sampled, sold, and re-exported to our colonies, &c, free of duty.

By referring to the Export Custom-house List it will there appear that thousands of gallons are weekly exported, but more particularly to Australia and the Canadas,

From the increasing demand for this article, the result has been that several British capitalists have been induced to invest in distilleries in Holland, in order to manufacture this gin for the purpose of supplying our colonies, &c.

If the Government would allow the exportation of British spirits free of the Excise duty of 7s 6d per gallon, which it is now burdened with, it would enable us to compete with the foreigner, and thereby increase the demand for British corn and labour.

## LITERATURE.

### FLORIGRAPHIA BRITANNICA;

BY R. DEAKIN, F. R. C. S. E., AND ROBT. MARNOCK.

Groombridge, Paternoster-row.

This work, which appears monthly, has now arrived at the twelfth number, and if it do not meet with an extensive circulation amongst florists, gardeners, and the lovers of Botany, it must arise from not being sufficiently well known. It affords an easy means of acquiring a knowledge of the qualities of the British grasses, whilst the plates render the eye familiar with their appearance. The following is a description of "*Holy Grass*," which was first discovered in a valley called *Kella*, in Angushire, Scotland:—

"This species like all others of the genus has the peculiar smell of new mown hay, similar to *Anthoxanthum odoratum*, but in a much greater degree, so much so, that according to Dr. Hooker, in Iceland, it is so plentiful as to be used by the people to scent their apartments and clothes; and it is said to be esteemed in Sweden for its narcotic effects. The produce of this grass in Spring is very small and of a very tender nature; these, together with its strong spreading underground stems, render it a grass of no agricultural merit, a circumstance which is to be regretted, as it contains a greater proportion of nutritive matter than many of the early grasses."

### THE FLORICULTURAL MAGAZINE;

BY R. MARNOCK.

Simpkin and Marshall, London.

The first monthly number of this publication appeared on the 1st of June, and is one which we feel convinced will find favour with all amateur floriculturists. The information contained in this work is practically useful, and the notices of new plants peculiarly interesting. We subjoin the monthly operations for June in the flower-garden:—

"**FLOWER GARDEN.**—Sow annuals to bloom late in autumn; and, during cloudy weather, transplant into the flower borders those sown in March and April. Plant cuttings of pinks, double rockets, sweetwilliams, and carnations.—(See page 3.) Divide and repot auriculas, and remove them to a shady situation. Transplant and repot polyanthuses, Chinese primroses, holly-

hocks, sweetwilliams, lynchnesses, pinks, pæonies. Tender annuals, grown in pots, should be repotted and kept in a stove or greenhouse. Towards the end of the month, when the foliage of anemones, tulips, ranunculuses, and other bulbous-rooted plants, have decayed, they must be taken up, dried slowly, and afterwards placed in a dry, cool, airy situation, till the planting season returns. Pansies, and all kinds of herbaceous plants, may now be increased by planting slips in moist, shady situations, in a north-east border, to receive the morning sun. Complete the planting of dahlias, bud roses, &c. Mowing, weeding, tying up plants—(See *Notice of Metallic Wire*, page 17)—and attention to the usual routine conducive to order and neatness, must ever be kept in view.”

### THE FARMER'S HARVEST COMPANION, OR AGRICULTURAL READY RECKONER;

Baldwin and Cradock, London.

The best proof of the excellence of this work will be found in the fact, that it has undergone *eight impressions*. In addition we shall only give the statement of a practical farmer:—

“I have a good parcel of land, and it has been the practice on my farm to pay fourpence an acre for the measuring into carts at the setting-out time, half of which was paid by the labourer. Now, with this book in my hand, a rod measure, or a chain, (which I prefer for plain land), and a boy, I can in the course of an hour or two, when at leisure, and the weather permits, mark out the ground without calling in the land measurer schoolmaster to my assistance, and to the greater satisfaction of the workmen.”

## THE SHEEP.

HISTORY OF THE SHEEP, CONTINUED FROM PAGE 38.

(From the *Dumfries Herald*.)

Sparman, in his Account of South Africa, observes, that the leanest sheep are always selected for slaughter on account of the amazing fatness of the tail.

Mr. Hemmy, the Lieutenant-Governor of the Cape, informed Captain Cook, when he put in for repairs during his last voyage, that he had endeavoured to introduce European sheep into the colony, but had failed through the obstinacy of the country people, who thought the superiority of the wool would not be a recompence for the deficiency of the tail.

Boethius, the Roman poet and Platonic philosopher, (A. D. 524,) mentions a breed of sheep in the Isle of Hirta, (west of Uist, and north-west of Havsker), larger than the biggest he-goat, with *tails hanging almost to the ground, and horns as thick as those of an ox*, in these respects agreeing perfectly with the African animal, and giving rise to curious speculations as to how they reached so insignificant a place. Perhaps the Romans, who always left a conquered country better than they found it, were instrumental in the transference; but of this we can determine nothing. A benefit has been conferred, it matters not by whom, and Hirta remains, even at this time, famous for its live stock.—(See *Aikman's Translation of the History of Scotland*, by George Buchanan.)

Burchell remarks, that the principal property of the boors of the Roggeveld consists in sheep; 2500, exclusive of lambs, being reckoned a small fortune, while a boor with 5000 cannot be called affluent. He once, in fact, met a person who was the happy

possessor of 30,000, certainly a most eligible investment for a fortune-hunting woman. At a village, to which was attached the feature-distorting name of Graaffreyneet, he conversed with a family, not a large one, which, being fed on mutton at every meal, required for the due holding together of the animal and spiritual, no less a proportion than two sheep daily: after that the Esquimaux may surely be allowed to enjoy in peace the exercise of their fastidious appetites.

The broad-tailed sheep affords in Thibet a fleece which is fine, long, and beautiful, and goes to form the shawls to which the ladies of all nations are so exceedingly partial.

The Cape sheep are said to have been introduced into North America, where they were regarded as extremely valuable, on account of the wool and flesh; but Stuart, in his late publication after a three years' residence in that country, thinks the Americans care very little about sheep, and does not so much as mention the African animal. “Sheep are not so much attended to as they should be in this country, where the dryness of the weather preserves them from diseases to which they are subject in Britain.”—“The marinos, and crosses with the marino, are those generally seen; but little care is paid to their being well fed before being killed and brought to market. The mutton is, of course, inferior in quality, and the people led to entertain prejudices against it; even the slaves in the south are said to object to being fed on sheep's meat.”

From the last part of this extract we are partly enabled to understand the reasons why mutton bears so exceedingly small a price in that quarter, and why, therefore, it constantly figures as a bait in the magnificent trap which is set every year to ensnare the unwary and the discontented.

Bonnycastle, in his work on Spanish America, remarks, that sheep are found in a state of nature in the northern part of New Spain, “having multiplied to an extraordinary degree in the wide spread plains and Savannahs;” but he very inconsiderately leaves us to guess the variety of the animal to which he alludes,—a mode of acquiring information we decline, or obvious reasons, resorting to.

The sheep of Persia, Tartary, and China, is distinguished from all others, by the tail forming a *double globe* of fat; the north of Europe and north of Asia is overrun by a breed in which the tail is wanting, while that of southern Russia, India, and Guinea, stands pre-eminent, from the elongation of the tail, and in respect to that of the two last named places, also of the legs.

Among these the only one which appears to have lately attracted much attention is the Puruk of Ladusk, in the Himalaya mountains, and which, from the description given of it by Mr. Moorecraft, in the transactions of the Asiatic Society, appears to be, in some respects, a most remarkable animal.

It is a branch of the small breed we have shortly noticed as inhabiting the north of Asia, but as the qualities assigned to it are such as may raise doubts in the minds of practical men, we cannot, we think, do better than permit Mr. Moorecraft to describe it in his own words—“The Puruk sheep of Ladusk, when at full growth, is scarcely as large as a south down lamb six months old; yet, in fineness and weight of fleece, and in flavour of mutton, added to its peculiarities of feeding and constitution, it yields not in merit to any race hitherto described. It gives two lambs in twelve months, and is twice shorn within that space. The clip may afford, in the annual aggregate, 1½lbs.; and the first yield is fine enough for tolerably good shawls. The British

flock-master would be delighted with the fineness of the bone, the spread of the carcase, the hardness of its constitution, and its aptness to fatten. The Puruk sheep, if permitted, thrusts its head into the cooking pot, picks up crumbs, is eager to drink the remains of a cup of broth, and examine the hand of its master for barley, flour, or a cleanly picked bone, which it disdains not to nibble; a leaf of lettuce, a peeling of turnip, the skin of the apricot, give a luxury; and the industry is indefatigable with which this animal detects and appropriates substances so minute and uninviting, as would be unseen and neglected by ordinary sheep; perhaps the dog of the cottager is not so completely domesticated as it is. I have been minutely tedious upon their acquired habits of feeding, as introductory to the conclusion, that there exists not a cottager in Britain who might not keep three of those sheep with more ease than he now keeps a cur dog; nor a little farmer who might not maintain a flock of fifteen or twenty without appropriating half an acre exclusively to their use: they would derive support from that produce which now either totally runs to waste, or goes to the dunghill." He goes on to state that he has procured a flock which, in the event of his falling, will, he hopes, be sent to Britain; but so far as we are aware, nothing has been heard of the matter since. With all due respect for the opinion of Mr. Moorecraft; we are led to believe that the introduction of such an animal would not be followed by the advantages he has been so sanguine in supposing, though no doubt correct in his statements, regarding the omnivorous propensities of the animal, as every farmer can testify from what he has seen of the lambs reared for amusement by children, yet he forgets the difference between a Tartar and a British population, and that small as is the product in that country, even when contrasted with the value of the feeding, it would be smaller still in this part of the world, where they would, from becoming speedily acclimated, bring forth and require clipping only once a-year.

Sheep are abundant in Persia, and, according to Sir John Malcolm, from the wealth of the wandering tribes who, however, pay no attention to the improvement of the breed.

Salt, while in Abyssinia, noticed a "small black species," and it is curious he should content himself with this, the very commencement of a description, though at that time labouring to gain us a knowledge of many animals which could only be viewed as zoological curiosities, and as such gain him the thanks of but a small portion of the community.

A notice of a breed between an Abyssinian ram and a French ewe made the tour of our newspapers in 1826; they were described as being extremely hardy and prolific, their fleece surpassing in brilliancy any that had ever appeared in Europe, while their beauty excited general admiration.

The fleeces of the sheep above Cairo are said to be very thick and long, and to have been used by the Egyptians for beds, as they were supposed to secure the sleeping owner from the stings of scorpions, which would not venture upon such a couch through a fear of being entangled in the wool.

The West India sheep are much esteemed in this country, to which they are sometimes brought by merchants ships, and after feeding a short time on our pastures are reckoned little inferior to venison.

The Icelandic sheep has straight upright ears, a small tail, and what is most to be remarked, no less sometimes than four or five horns. They are exceedingly fond of scurvy grass (*cochlearia*), on which they soon acquire fat, and are much valued by their owners on account of their milk, of which they yield

from two to six quarts a-day, most of it being made into butter. It has been affirmed, but with what degree of plausibility we cannot determine, that the ewes in the holmes round Kirkwall, in the island of Mainland, (one of the Orkneys,) frequently drop dead when frightened near lambing time.

Pennant, alluding to the extensive use of flannel in Wales, remarks that "Wales yields but a coarse wool, yet it is of more extensive use than the finest Segovian fleeces; for rich and poor, age and youth, health and infirmities, all confess the universal benefit of the flannel manufacture."

The time is now past that justified the remark of Crabbe,

"When flannel wreaths the *useless limbs* enfold."

As flannel is at present used by the strongest and healthiest individuals in the hottest climates, and with the most decided advantages, frightful bowel complaints having, as Sir George Ballingall remarks been frequently stopped in European regiments in India, by the men being supplied with flannel shirts. The poorest of the Welsh peasantry make use of flannel coverings, which are thrown aside during the period of active exertion, only to be instantly resumed when that period has ceased.

The Welsh sheep are reckoned the best for a mountain next the Cheviot and black-faced breed; their wool, in fact equals that of the former, while they have some of the requisites of a good feeder, such as clean heads, small bones, and thin erect ears, and are healthy, hardy, and active, but of small size, weighing from 7 lbs. to 15 lbs. per quarter.

It has been believed, from Britain having been partly peopled from Spain, that our sheep were originally Spanish; and as Giraldus Cambrensis (*Collectan. de Reb. Hibern.*) a work we have only been enabled to consult at second-hand,) affirms, that the Irish in his time were clothed in black garments, from the wool of their sheep being so coloured, some have supposed the sheep of that island were imported from Spain,—a supposition rendered probable by Southey telling us, in his letters from that country, that in the north of the Peninsula the animals are almost all of a black colour.

Borlase, in his *History of Cornwall*, ascribes the fatness of the sheep near the Land's End to their eating snails of the turbinated kind, along with the dewy food they were wont to obtain at day dawn. Snails have always been reckoned good and nutritious food; but we never, till now, imagined that our pet was so much of a gourmand as to vary its diet at the expense of so tiny a lover of good herbage.

We shall, before proceeding to the British breeds of the present day, furnish our readers with a few of the Acts which have been passed by Parliament in regard to sheep, only however, producing such as have a direct reference to the present division of our subject.

Though there are innumerable Acts relating to wool, yet there are comparatively few which allude to the animal that bears it; and these may in most instances be viewed merely as matters of curiosity. The earliest that has fallen under our notice is one passed by the eighth Parliament of James II., chapter 36, requiring that no cattle be sold to Englishmen in England but for ready gold and silver, under the pain of escheat betwixt the King and the warden.

By an Act of the seventh Parliament of James the Sixth, chapter 124, all Acts are ratified which have been made against the transporting of sheep or other cattle forth of the realm.

An Act of the twelfth Parliament of James the Sixth, chapter 149, forbids sheep to be transported to

England, or sold to Englishmen who transport the same.

In an act of the first Parliament of Charles the Second, session third, chapter 12, Anno 1663, for the encouragement of tillage and pasturage, it is declared, that barrelled flesh may be exported by sea free of custom, bullion, or other imposition for nineteen years; and that bestial (including, of course, sheep,) may be exported free of custom, &c. for the same term. During the reigns of Henry VII. Henry VIII. and Edward VI. an undue preference was given to grazing so much so, as to call for several Acts to put a stop to what, from mismanagement, was fast ruining the country, by driving the people from it. Henry VII. exempted Norwich from the penalties of the law on account of the decay of manufactures from the want of hands; and shortly after, the whole county of Norfolk obtained a like exemption with regard to some branches of the woollen manufacture. The practice of depopulating the country, by abandoning tillage and throwing the lands into pasturage, had run to so great an extent during the time of Henry VIII., that an enactment was made, whereby the King became entitled to half the rents of the land where any farm-houses were allowed to fall to decay; and the number of sheep in a flock was limited to two thousand. Hume conjectures, in his History of England, that unskilful husbandry was probably the cause why the proprietors found no profit in tillage,—thus leading a farmer to keep a flock sometimes of twenty-four thousand, as expressed in the statute, and increasing the price of mutton, which remarkable coincidence Parliament attributes to the commodity having gotten into few hands, though Hume ascribes it to the daily increase of money, thinking it almost impossible that such an article could be engrossed. At the commencement of the reign of Edward the Sixth, the people were still sadly deficient in a knowledge of agriculture,—a profession which, as Hume wisely remarks of all mechanical employments, requires the most reflection and experience. A great demand having arisen for wool, both at home and abroad, whole estates were laid waste by enclosures; while the tenants, regarded as a useless burthen, were expelled their habitations, and the cottagers deprived even of the commons on which they fed their cows:—no wonder there was a decay of the people. Perhaps Goldsmith had these times in view when he wrote—

“Princes and lords may flourish or may fade,  
A breath can make them as a breath has made;  
But a bold peasantry, their country's pride,  
When once destroyed can never be supplied.”

The grievance, in fact, was so great, that Sir Thomas More, alluding to it in his Utopia, observes, that a sheep had become in England a more ravenous animal than a lion or a wolf, and devoured whole villages, cities, and provinces.

From such doleful pictures we turn with renewed delight to the peaceful attributes of the benefactors of our commerce, and shall give, in as condensed an arrangement as possible, the conclusion of their history.

The breeds of our island, as they at present stand, may be divided, into two kinds—long-woolled and short-woolled; the former embracing the Teeswater, the Dishley or New Leicester, and the Devonshire nots; while the latter will include those of Dorset, Hereford, Sussex, Norfolk, and Cheviot.

The Lincolnshire has no horns, the face is white, the carcass long and thin, the legs thick, white, and rough, bones large, pelts thick, and the wool from 8 to 10 inches in length. The ewes weigh from 14

lbs. to 20 lbs. per quarter; and three-year-old wethers 20 lbs. to 30 lbs. The flax weighs from 8 lbs. to 14 lb., and covers a coarse-grained slow-feeding carcass, so slow, indeed, at feeding, that it cannot be fattened at an early age except upon rich land; but the breed is encouraged from the great weight of wool that is shorn from them every year, while it and its sub-varieties are extremely common in the English counties.

The wool of the Teeswater is not so long and heavy as that of the former; they stand upon higher and finer boned legs, which support a firmer and heavier carcass, much wider upon their backs and sides, and afford a fatter and finer-grained mutton; the two-year-old wethers weighing from 25 lbs. to 30 lbs. per quarter.—(See Cleghorn on Agriculture, in the seventh edition of the *Encyclopædia Britannica*.) These were originally bred from the same stock as the former, but have become different from attending to size rather than to wool. Marshall, in his work on Yorkshire, remarks, that they are not so compact nor so complete in their form as the Leicestershire sheep; nevertheless, the excellency of their flesh and fattening quality is not doubted, and their wool still remains of a superior quality. For the banks of the Tees, or any other rich fat land country, they may be singularly excellent. Rams of this breed have been employed of late in crossing ewes of the Leicester breed in Northumberland and Berwickshire, but with what success has not been determined.

The Dishley, or New Leicester, is distinguished from other long-woolled breeds by clean heads, straight broad flat backs, round bodies, small bones, thin pelts, and disposition to fatten at an early age; but more of this hereafter. The weight of three-year old ewes is from 18 lbs. to 26 lbs. per quarter, and of two-year-old wethers from 20 lbs. to 50 lbs. The wool averages from 6 lbs. to 8 lbs., and is thought by some to be inferior in quality to that of Cheviot sheep; but, from being fully fed at all seasons, they yield great quantities of it.—(*Practical Observations by John Little*.)

The fourth hornless variety of long-woolled sheep is the Devonshire nots. They have white faces and legs, the latter being short, and the bones large, while the necks are thick, the backs high, and the sides good. They approach in weight to the Leicester; but the wool is heavier and coarser. In this county are found the white-faced and horned variety, which are known as the Exmoor kind, from the place of their nativity. Though very delicate in bone, they are not good, having a narrow flat-sided carcass, while the weight of the quarters and fleece is a third short of the former variety.

All that we have here described are suited only for luxurious pastures; but the next, or short-woolled kinds, are nicely adapted by size and form for hilly countries and inferior fare, though not sufficiently hardy for mountainous and healthy districts.

The Dorsetshire sheep are horned and white-faced, with a long thin carcass, and high small white legs. Three-year-old wethers weigh from 16 lbs. to 20 lbs. a quarter; but the wool being fine and short, weighs only from 3 lbs. to 4 lbs. a fleece. It is, however, amply compensated for by the mutton, which is of superior quality. This breed has a peculiar property—that of lambing at any period of the year, often so early as September and October—and is on this account extremely valuable for supplying large towns with house lamb at Christmas.

The Wiltshire sheep are a weightier variety of the former, averaging from 20 lbs. to 25 lbs. per quarter. According to Mr. Culley, “The variations of the breed are spread through many of the southe

counties, as well as many in the west, viz., Gloucestershire, Worcestershire, Herefordshire, &c."

Herefordshire or Ryeland sheep have white legs and faces, and no horns, the wool growing close to the eyes. They are of a size suited to every market, weighing from 12 lbs. to 18 lbs. a quarter, with a tolerably well formed carcass and fine short wool, each fleece weighing from 1½ lb. to 2½ lbs.; they were called Ryeland sheep, from the land being thought capable of growing nothing but rye. Their figure is good; but the back is not so level, nor the ribs so well rounded, as in the most improved breeds. They fatten easily, and arrive soon at maturity, though reckoned inferior in these respects to the Cheviot variety.

The South Down, like the Ryeland, are, from the delicacy of their constitution, unadapted for bleak situations, but sufficiently hardy and active for a low country; their average weight is from 15 lbs. to 18 lbs. a quarter; that of the fleece, which is very short and fine, being from 2½ lbs. to 3 lbs. They are without horns, have grey faces and legs, a neck low set, and small, and a breast neither wide nor deep; their mutton is fine in the grain, and of an excellent flavour, having been brought to great perfection by Mr. Elman Glynd and other intelligent breeders. They are mostly found in Sussex on dry chalky downs, producing short fine herbage, and arrive early at maturity, in which respect they are equal to the Cheviot, though inferior to them in quantity of tallow.

Norfolk sheep are celebrated for a voracious appetite and unquiet disposition, and are good for nothing but folding, for which alone they are retained. They have long legs, a light lean carcass, a black face, and large spiral horns; weigh from 16 lbs. to 20 lbs. a quarter, and have large bones, though the fleece is fine, averaging from 1½ lbs. to 2 lbs.

The Cheviot sheep have no horns, a bare head, white face and legs, with a long jaw. The legs are clean, small boned, and covered with wool to the hough, but there is a sad want of depth at the breast, and of breadth both there and on the chin. A fat carcass weighs from 12 lbs. to 18 lbs. a quarter, and a medium fleece about 3 lbs. They vary occasionally, especially about the face, from an intermixture with their neighbours. These sheep are a capital mountain stock, provided the pasture resembles the hills around Cheviot, in containing a considerable proportion of green sward; indeed, the flocks which have been sent to the Highlands of Scotland have succeeded admirably, supplanting in many instances the black-faced kind.

The black-faced or heath variety are known by their large spiral horns, wild-looking eyes, black legs and faces, with short firm carcasses, covered by long coarse wool, which weighs from 3 lbs. to 4 lbs. When three years old they fatten well, giving excellent highly flavoured mutton, and weighing from 10 lbs. to 16 lbs. a quarter. They are the most valuable upland sheep in Britain, abounding in all the western counties of England and Scotland.

There are four limited races yet to be noticed, two of which will be deferred till our paper on Wool—the first is a kind peculiar to the rocky district at the head of the Duddon and Esk rivers, in Cumberland. They are termed *Herdwicks*, from having been for generations back farmed out to *herds*. They are hornless, having speckled legs and faces, with short wool, which weighs from 2 lbs. to 2½ lbs. a fleece, and reported as finer than that of the heath sheep.

The Dun-faced is supposed to have been brought to Scotland from Denmark or Norway at an early

period, and still exist in small flocks north of the Firth of the Forth. There are some varieties, but they may all be arranged under those of the mainland of Scotland, and those of the Hebrides and northern islands of Orkney and Zetland.

(To be continued.)

## DENVER (NORFOLK) SHEEP SHOW.

Messrs. Thomas and Joseph Brown held their annual show for selling and letting of tups on Thursday se'night, when a numerous company assembled—some of whom came from a great distance, and who were evidently both pleased and surprised at the perfection to which the intelligence and energy of the Messrs. Browns have carried their favourite Leicester breed of sheep; both in form and condition they were acknowledged to surpass the animals shown last year; but the best proof of their excellence was the fact, that a great proportion of the tups were let at prices sufficient to indemnify the owners, and yet quite within the means of all sheep farmers, to whom purity of blood, symmetry, constitution, and early aptitude to fatten are objects of attention; and what sheep farmer does not deem them such? We consider these gentlemen entitled to the thanks of the community, and worthy of all commendation, for the opportunity they have thus afforded their brother farmers of improving their breed of sheep, and at no exorbitant rate, of acquiring a stock of lambs, which both in wool and carcass, shall amply repay them all the cost and labour of rearing them. This praise is the more sincere on the part of the writer, because he happens to be a partisan of the Southdown, rather than the Leicester breed of Sheep; but it will be remembered that there is such a thing as combining the excellencies of the two, and by putting a Leicester tup to Down ewes, a most valuable animal, both as to wool and carcass, is the result. Now breeders of half-breeds, are not in general sufficiently awake to the necessity of attention to the quality of the tup. Any sheep, so he be but a Leicester, they think will do to cross with; there never was a greater fallacy. At least as much pains should be taken to procure a perfect sire in this case as any other, and why not? But we are dealing in truisms, when we ought to be going on with our story. After the sheep had been shown, seen, and handed by all the *cognoscenti* present, the party adjourned to a large tent, which had been erected in front of the house, and nearly forty sat down to a sumptuous dinner. Amongst whom were E. R. Pratt, J. W. Gooch, J. W. Powell, Esqrs., Messrs. R. and H. Childs, Littles, Waddell, Anderson, Paul, Mumford, Garnham, Hunter, Leete, Chester, Read, Bush, S. Taylor, Stanger, Ewen, Burrell, Cottingham, Whirry, &c. After a few of the usual preliminary toasts had been given from the chair by Mr. T. Brown—E. R. Pratt, Esq., rose, and expressed the very high gratification he felt as Mr. Brown's landlord, in being present at so large and respectable a meeting. It always gave him great pleasure to meet the yeomanry, and particularly on an occasion like the present, when his own estate and his own tenants furnished the means of improvement in a very important point of husbandry, sheep management. He himself was a Southdown breeder, but he not the less appreciated the labours of the Messrs. Browns, believing they were calculated to be of eminent service to their brother farmers. Entertaining these sentiments, he begged to propose the healths of their worthy hosts, and success to them, with three times three. (*Loud cheers.*) The presence of this venerable and highly respected individual, a true specimen of "the Old English Gentleman," added greatly to the interest of the meeting. After several other suitable toasts, the company again adjourned to the sheep pens, and the business of the day was concluded by those who had not already made their bargains—the party finally dispersing much gratified with the proceedings of the day.

## HORTICULTURE — COMMON CABBAGE, EARLY YORK CABBAGE, LONDON NEW YORK CABBAGE, SAVOY, BROCCOLI, AND EARLY WHITE WARWICK PEA.

By Mr. TOWERS, Author of the Domestic Gardener's Manual, &c. C. M. H. S.

(From the Quarterly Journal of Agriculture.)

The *Brassica*, or cabbage tribe, presents us with the most important crops of the season, I mean the period included between the 1st of June and the two succeeding months. It is proposed to select three of the numerous species, namely, 1st, Common round-headed or hearting *Cabbage*,—2d, The *Savoy*,—3d, *Broccoli*.

I. THE COMMON CULINARY CABBAGE, *Brassica oleracea*, of Decandolle, No. 4. *elliptica*, the early York, and particularly that fine improved variety, now called London *new York Cabbage*. All the members of the tribe belong to one family or genus, termed *Brassica*: they are found in the natural order *Crucifera*, the leading characters of which are four opposite petals, ranged in the order of a cross; there are four petals or calix-leaves, six stamens, two of which are rather shorter than the other four, and this latter circumstance gave rise to the name selected by Linnæus to designate the members of his 15th class *Tetradynamia*, a compound Greek word, which indicates the power or *supremacy of four* out of the six fertilizing organs. It may be of some importance to the farmer and cottager to be informed that, among all the plants of this class or natural order, not one perhaps is possessed of any really deleterious property. Among nearly one thousand species, as Dr. Lindley observes, "scattered over the face of the world, all are harmless, and many highly useful."

The varieties of the cabbage are numerous, but he *who possesses* the best early York, has that which combines most of the valuable qualities of that excellent vegetable—compactness of heart, firmness, sweet flavour, and convenient size and form; it is also hardy, of very ready culture, and occupies but little space. I do not recommend it merely as a *culinary* vegetable; it might, and I think should, be made to rotate with the crops of the farm. It is not my desire now to digress, but I hope on a future occasion to adduce facts which will go far to prove that every farm throughout the kingdom would be improved, and the agriculturist proportionably benefited, by a greatly enlarged rotation. The land has powers and capabilities to double its productive return: we southerners are much indebted to our northern brethren for the lessons of wisdom which their refined system of agriculture has already taught us, but these cultivators, skilful and persevering as they have effectually proved themselves to be, may still advance; and with this conviction before me, I hope I may not be deemed presuming, if, at the earliest opportunity, I venture to attempt to fulfil the intention which I have alluded to above, and for which I am collecting the requisite documents.

The *soil* for cabbage should be a sound mellow loam, of a quality usually termed *fat*, or unctuous, wherein the *silice*, which forms its chief constituent, is in a state of extremely minute division, and united to a greater proportion of argillaceous earth (*alumine*), than most common, gritty soils

are; but the chief desideratum of an unctuous loam is the impalpable state of the *silice*; for I have analyzed one of the finest loams I ever saw, without being able to detect in it more than five or six per cent. of clayey substances, and scarcely a grain of chalk. But the cabbage will do well in most soils, provided it be exposed to the full influence of light and air, and be not shaded or stifled by trees, shrubs, or buildings.

SEED.—This will retain its vegetative power for three or more years, but it is always better to employ that produced in the preceding season, or if two or three year old seed be used, it should be tried in heat, sown in a flower-pot: a serious loss of time may be occasioned by a failure of the seed-bed. An ounce of seed will suffice to sow forty square feet, if scattered broadcast, but less will be required, if sown in drills, six or seven inches asunder; and this method is always advantageous, because the Dutch or thrust-hoe can, at any time, be passed easily between the rows. If cabbage be cultivated in the *field*, it is calculated that half a pound of seed will afford more plants than will grow on an acre; and it is stated, in recommendation of the vegetable for the purposes of the farm, that if the cabbages be cut, freed from bad leaves, and carried to the cow-yard, "they are more beneficial than hay, given in any proportion, when only combined with straw."

"In the *fattening* of neat cattle, an acre of good cabbages may be nearly sufficient for three beasts of from forty to fifty stones each, which have been grazed in the pasture during the summer. A middle-sized bullock, in general, consumes about 100lb. in twelve hours."\* "Half an acre will be nearly sufficient for 100 sheep, when the crop is good: a sheep consumes nearly 10 or 12lb. in 12 hours.—(*Baxter's Agric.*) I have repeatedly tried cabbage in cow-feeding, and on every account recommend the substitution of *York cabbages* for the coarser and more bulky varieties.

In *garden culture*, we have to consider the object of the cultivator; if spring or early summer cabbage only be required, one sowing of a single long row or a small bed will suffice. In the southern or middle counties of England, it is usual to limit the period of sowing between the 6th and the 12th days of August; but in the north, I presume that the third or fourth week of July should be chosen. Experience has proved that seed sown early in July, will produce plants which are liable to run to seed in the following spring; while, on the contrary, the plants of late sowings rarely acquire strength sufficient to resist the rigours of the winter. *The soil for a seed-bed* ought to be lighter than that used during the future growth of the *plants*; it should be moved to the depth of a few inches, and made very fine: then, the line being strained tight, the first drill is to be cut by drawing the angle of a hoe in the direction of the line, with its edge resting against it. An inch or less in depth is sufficient; but, as all seeds rise better if they rest upon a true surface, and be closely

\* There must surely be some error in this statement, of an acre of cabbage being able to fatten nearly three beasts of from 40 to 50 stones each: 100lb. of cabbage in twelve hours, that is the average number of hours of day-light in each day, for twenty weeks from the end of October, will amount only to 6 tons 5 cwt. Now a middle-sized ox will, in that time, consume 30 tons of Swedish turnips. Do. 6 tons 5 cwt. of cabbage yield as much nutriment as 30 tons of Swedish turnip!—EDITOR.

embraced by the mould, it will be proper to level and compress the bottom of the little drill by patting it with the back of a wooden, round-headed rake, or by placing a long pole, like the handle of a rake, into it, so as to form a sort of groove. In this, the seeds are to be scattered as regularly as possible, after which it would be as well to dust them over regularly with a powder composed of two parts (say pounds) of powdered quick-lime, one part of coal-soot, and one sixteenth part (one ounce) of flour of sulphur. This mixture is inimical to insects, and does not injure the young plants. The groove is next to be filled up with fine earth, which is to be made firm and even, by pressing it down with the flat of the spade. In like manner, all the other drills may be made and finished. If the weather be showery, and the ground in a moist state, but still free and open to work, nothing more need be done. It sometimes happens, however,—as was the case to a very injurious extent throughout the summer of 1835,—that the soil is found dry even to dustiness. In that case, as it will not answer to let the critical period pass over, the intended bed should be watered copiously for three successive nights, till it become completely moist, and a mat or two must be thrown over it during the intervening days. Seeds sown in soil thus prepared, will vegetate very rapidly; for warmth and moisture are the prime actuating agents of vegetative life, as direct solar light is that of maturation. Waterings, or rather the ordinary sprinklings, so termed, will prove of no avail, if the seeds have been sown in arid soil, as was fatally proved last year. In hot sunshine, the mat ought to be used till the seeds vegetate. *The seedling plants* will be liable to the attacks of slugs and other enemies; to guard against which, they may be sprinkled with a little of the powder mentioned above; or the spaces of soil between the rows may be covered with dry saw-dust or chaff; but thick sowing is perhaps the most effectual means to secure a sufficient supply, and it is always prudent to practise it, because many seeds are inert; and it is better to displace the supernumeraries by timely thinning, than to have a paucity of plants, nine-tenths of which may perish by accidents. When the first true leaves appear, and acquire a little strength, much of the danger will be past, and the plants ought to be thinned out, so as to stand an inch asunder. Again, as they advance in growth, they ought to be reduced in number till double that space intervene between plant and plant.

**TRANSPLANTING.**—Some gardeners have attempted to obviate this operation; but the roots first produced are few in number, though strong, and of considerable length; the plants also acquire a tall and shankly growth; and above all, it is evident that, if cabbage plants be made to perfect their growth on the site where the seeds were sown, the allotted space must be very great, because they *must* be thinned out so as finally to stand one foot asunder at the least. Transplanting, therefore, should be practised, and that, too, as soon as the young plants have become three or four inches high, and begin to crowd each other. The operation effects two or three good objects. It causes the roots to produce a number of short fibres, or, as it is termed, to become “stocky;” it dwarfs the plants, and, while making them strong and compact, secures them to the soil; and it enables the grower to protect those left in the seed-bed (as some always should be) by coverings of mats thrown over arches, formed of

hoops or pliable rods, in the event of very severe weather.

In transplanting, let the bed or plot be a good firm loam, if possible, pretty well manured, thoroughly digged, and in a free, open situation. Select strong plants of nearly equal growth, and insert them in rows by means of a dibble or trowel, fixing each firmly in the soil, eighteen inches apart every way, if the variety be a free grower; but the small Yorks will do very well if the rows be that distance apart, the plants standing only twelve inches asunder in the lines or ranks. It is indispensable that the soil be brought closely to the roots, and made to press them firmly in every part; and should the weather be dry, much time will be gained by making the holes so deep as to receive the plant to the full length of the stem of each, and filling every hole brimful of soft water: then, by pressing the soil laterally and on every side with the tool, the roots will become puddled in, and secured at once. The period for the work must depend upon the growth in the seed-bed; and if the season be early, and the weather warm and showery, the transplanted cabbages may grow so rapidly as to require the check of a second removal, or at least to be raised up and reset; but in general, and under ordinary circumstances, it will be sufficient to leave them undisturbed, as then the crop will be ready for culture at a more early period of the spring. In the south, it is no uncommon circumstance to cut fine-hearted cabbages in April, and very good ones in May. In the north, the growth must be more tardy in most situations.

The *seed-bed* will require care and attention. I have said that some plants ought to have been left in it; and I urge the practice, because, in severe winters, the entire crop is sometimes cut off. The seedlings remaining ought, however, to be raised up; the longest roots cut back nearly one-third, and the plants be re-set in regular order and distances. Thus, supposing that 200 plants remain in it, and be made to stand four inches apart in rows which are six inches asunder, a bed little more than twelve feet long and about three feet wide, including its edges, will contain this valuable stock, which in severe weather could be covered by three or four garden mats, and thus secure a pretty ample supply of plants for the spring. Another precaution may always be resorted to. In transplanting, deep drills or grooves can be formed by the hoe or spade, and along these the plants may be set so deep, that the lowest leaves may stand just above the soil. I adopted a still more efficient plan of security last October, though I do not recommend it, because I think the growth in the early spring months is thereby retarded. Having a piece of ground set up in ridges, nine inches high, and the time pressing, I planted my young cabbages in the bottom of the trenches between the ridges. On three occasions the thermometer fell twenty-two degrees below the freezing point, and not a plant has been touched, though no covering was applied at any period of the winter. My broccoli, also, has stood in perfect security, in consequence of the stems being lower than the level of the edges of trenches made expressly for them. However, as cabbages ought to be hoed freely in the autumn, and the spaces between the rows digged once or twice, as soon as the plants resume growth in the early spring, it is evident that the ridges present an obstacle to these important operations. If the winter prove mild, the cabbages will progress in some degree; but if by

cold they be rendered torpid, they will start into growth with the early return of solar influence: a few may fly up to seed, but the greater part will form hearts, and can be cut in succession. In cutting, it will be prudent never to take off the green and healthy leaves; those that are inert and yellow, will scale off of themselves, or with the slightest effort; but the green and firm ones have still an important office to perform, in perfecting the axillary buds which produce young sprouts. These secondary cabbages, or "greens," affect an open growth, and in themselves furnish a delicious vegetable, but they may—that is a portion of the best formed among them—be devoted to another purpose of considerable utility in garden economy. The shoots when about five or six inches long, are to be gently twisted off from the stem, and the lacerated heel of each being trimmed perfectly even and smooth with a very sharp knife, but not shortened; the young plant thus rendered a cutting is to be very carefully planted in lightish, sandy, fresh moved loam, so deeply as nearly, but not quite, to include the entire stem. The setting-stick or dibble is to be thrust diagonally into the ground in three or four places, in the direction of the heel, so as to fix it firmly in the soil, and then a little water should be given to each plant to wash the earth closely about the stem. Detached shoots so treated, will frequently produce roots speedily, and bring a supply of excellent secondary cabbages, true to the original varieties; *seeds* are apt to sport, owing to cross impregnations.

To sum up the chief points of cabbage-culture for spring and summer main crops, it must be observed that the *period of sowing* should be strictly attended to; the *seed-beds* are to be slightly hoed to keep the ranks clear of weeds; the stronger plants are to be timely removed to the final beds, wherein two autumnal hoeings and a moderate earthing up must be given during the progress or growth. On the approach of spring, the intermediate spaces are to be digged or forked, after the removal of the inert leaves, and the operation should be repeated when the plants evince the tendency to fold up their inner leaves for hearting. By a careful attention to these needful processes, a bed of fine cabbages will, in favourable seasons, be secured. Having thus dwelt so minutely upon the routine culture of the cabbage for the main spring and summer supply, I shall only allude to that part of the treatment of succession crops, which refers to the summer and autumnal months.

It is usual to give directions for sowing the seed at several distant periods; but my object is to obviate trouble, and to simplify operations as much as possible; and as I have proved that, by attentive management, a regular supply of fine plants may be obtained from one extra sowing, I shall presume that an extensive seed-bed or pot exists, having been prepared late in March or early in April. The mode of culture will be understood by the directions already given; what, therefore, remains to be said, will apply to the order of routine which ought to be observed subsequent to the *first of June*. At that time, we may suppose that the greater part of the cabbages have been cut, the stems remaining being left for the production of sprouts. The seedlings of the April bed that are in a state to be transplanted, should be carefully selected, and set in a bed of rich soil, watered, and attended to in every respect as were those of the spring crop. This first bed, with the cuttings of the sprouts and the other shoots yielded by the

old stems, will produce an ample supply of a second crop during July and August.

After the removal of the seedling plants, those which remain in the seed-bed should be gently lifted and replaced, but at regular distances, three or four inches apart; the ground should be moved, cleared of weeds, made level, and well watered if the soil be in a dry state. Should the plants be very numerous, a hundred or two of the best might, with great advantage, be moved to a succession bed to stand in rows, six inches apart, plant from plant. Thus they will acquire stocky roots, and be checked for a time; while the seedlings will gain strength from the additional space afforded them. If a bed be formed and planted for cabbaging in June, and thence every two months; and especially if—as I must presume—a previous transplantation had already been made during May, it is obvious that a succession of crops will be secured during every favourable season till the end of October; and I may add, from positive experience, that if the weather be then fine, and the succeeding winter prove open and mild ("a green yule"), any remaining stock in the seed-bed, however long-shanked and ungainly they may be, if set deep in the soil of a well prepared bed, may make good progress to the end of November, survive the winter, and produce excellently hearted and sweet tasted cabbages in April. Small they will be, and some perhaps will fly to seed; but those which do succeed, will amply reward the attentive care of the grower. My experience applies, of course, to the latitude of London, though in a county far westward, and much later in its productions; but I presume that in the north also these hints may be rendered to a certain extent available.

2. THE SAVOY, BRASSICA OLERACEA BULLATA OF De Candolle—a variety distinguished from all other hearting cabbages by the puckerings of its leaves. It is one of the prime winter vegetables, and well merits the attention of every one who has a garden or kail-yard. There are three subvarieties—the large yellow, the green, and the smaller *green*, which is the hardiest of the three.

The savoy must be sown pretty early in the spring, and therefore I say nothing now of the early processes of its culture; but as it will require transplanting to plots where it is finally to remain, it will be needful to observe, that, as in all respects the intermediate culture will, as nearly as possible, resemble that of spring sown cabbage, the directions above given will apply to it. In England it is customary to transplant at two or three periods of July for the main winter supply; but it will be proper to commence the work earlier in the north, and to finish by the middle of that month. The ground should be well digged and pulverized; the texture rather light, and the quality rich. Draw drills or shallow trenches about thirty inches apart; tread along the drills or press them with a broad pole, till the soil become smooth and compact; then plant the savoy's eighteen inches asunder, filling the holes with water, and fixing the roots firmly in the soil. After they have become established, and begin to grow, the spaces will require the hoeings and diggings which are so essential to the progress of plants of all the cabbage family, and have been before alluded to. As winter approaches, the earth ought to be brought up to and about the stems.

The planting in open, manured trenches, in *dry* weather will not only secure the growth of the

plants, but greatly tend to protect them from frosts during winter. *Savoy*s are not considered to be in perfection, till they have been exposed to a degree of frost; and they will subsequently furnish the table throughout the winter months.

3. BROCCOLI.—This variety of the cabbage tribe is divided into a number of subvarieties, all of which are excellent furniture for the garden. By Professor De Candolle it is placed in the sixth division of his arrangement, *Botrytis* (*Brassica botrytis*) i. e. resembling a bunch or cluster of grapes, but this grape-like species or variety admits of another subvariety, as No. 1 is the cauliflower, *Cauliflora*, or flowering cabbage; but No. 2 is the broccoli, and is designated as *Asparagoides*, or asparagus-like cabbage. Though the similitude of broccoli to asparagus may appear somewhat fanciful; yet as precision of classification is obtained, it will be perceived that it is far better to enter into minutæ closely, than to persist in a mode of arrangement which is equally ill defined and indiscriminating.

This delicious vegetable is perhaps without its rival in the garden, and its culture is very simple: it is too late, however, in the season to raise it from seed, and therefore, I defer to enter upon a regular detail till the spring of next year. I have, however, raised some of the finest *Portsmouth* cream-coloured, from seeds sown after the 10th of June, which produced compact and exceedingly large heads in the following April and May: it may therefore be worth while to try a small sowing as early as possible in June, following the directions, in as far as concerns the mode of preparing the soil, &c., which are given under the article cabbage, and transplanting into manured trenches, six inches deep, and ten or twelve inches wide, not later, if possible, than the third week of August. In the event of frosts, before November, no time should be lost to bring the earth that was thrown out, and lay as a ridge on each side of those trenches, to the stems of the plants, as is done in earthing celery.

But if we may trust some modern writers of new discoveries, *broccoli* may be propagated by slips, with the most successful results. Every one ought to try the method who has in his garden the stems of plants, the heads of which having been cut show a tendency to protrude sprouts. In the *middle of June*, says a writer, whose article is now before me, (or for Scotland, say as *early as possible in June*.) “I slipped off a quantity of the side shoots, and planted them. I had them well watered and well secured in the soil. They struck root in a very short time, and made strong plants which produced heads of a fine size at the usual season.” “I am persuaded the plan is well deserving attention, not only with broccoli of the same kind I have cultivated (*late flowering purple*) but with many other kinds; thus an excellent variety might be perpetuated without the risk consequent upon seed.”

I have not myself had an opportunity of experimenting upon this vegetable since I saw the article quoted from, but have reason to believe that the plan has been proved to be feasible; in fact, there is nothing in the analogy of the species with its type, which is unfavourable to the operation.

4. PEASE.—At this season of the year it may appear almost too late to speak of the cultivation of the pea; but I am inclined to notice it for a reason which will be shortly explained.

The GARDEN-PEA, of which there are many

varieties, is found in the fourth tribe, *Viciae* (that is among the vetches) of the great suborder PAPILIONACEÆ of the natural order *Leguminosæ*, and in the 17th Class, 4th Order of the Linnean System, *DIADELPHIA Decandria*. Every one is aware of the peculiar shape assumed by the blossoms of plants of the pea tribe; which, it is evident, can readily be made to constitute the type of a very natural class, in which most of our esteemed leguminous or pulse-bearing vegetables are to be found.

At some future day, I intend to enter at large upon the characters of all the favourite peas for table use; but on the present occasion I only allude to one, which is a great acquisition, and of very recent introduction, the early white *Warwick*. It is adapted to field, as well as garden culture, is moderately prolific, hardy, extremely early, rapid in its course of growth, soon off the ground; and of a high peculiar flavour, that to some persons is extremely agreeable, though others do not affect it.

The seed, two years since, was dear, its price is now reduced; and it is stated that three crops may be produced on the same land, and leave it open for wheat. This, however, I have not seen proved: but having grown the pea, I can recommend it to every one who wishes to possess a rapid grower. A crop sown in a long drill very early in June, may be succeeded by another sown in July, with every prospect of success. If the ground be dry, from a continuance of hot weather, the best method to ensure a vigorous plant is to dig a moderately broad trench, to saturate the soil at the bottom with water, to return the earth into the trench, and make that very wet; then, after covering the earth with mats, or green boughs for a day, just to permit the earth to settle, and so far to drain itself as to become in a workable condition, to strike a drill three inches deep, to sow the seed along it pretty thickly, but not in the crowded state too frequently seen; water should then be poured from the spout of a pot over the pease, and the loose earth returned upon the seeds, and pressed or trodden firmly over them. One liberal preparatory watering thus given, is of more avail than fifty subsequent sprinklings. *Mildew* so common on the plant of autumnal crops, is, as Mr. Knight truly observes, obviated. He has, as perfectly fine peas on his table in October, and it is certain that where disease can be prevented, peas in that season are a delicacy of the first-rate excellence. The *Warwick*, I think, promises to prove a valuable species for the purpose of a late crop, because the course of its entire culture is more rapid than that of the “frame” or early *Charlton* pea. When the plants rise above the soil one inch, the earth near the roots ought to be loosened by the trust hoe. Another hoeing must be given when the plants are three inches high; and then, after drawing the lightened earth to the stems, to the height of an inch and a half, as a ridge on each side, branching sticks a yard high are to be applied. Nothing favours pea culture more than judicious sticking: the plants are brought to the light, are supported, and at the same time protected. *Mildew* is the bane of autumnal crops: it seems to be promoted by a droughty state of soil, high solar heat during the day, and cold dews at night: rapidity of growth produced by a deep moist bed, procured by preparatory and *profuse* waterings, appears to be the only effectual security from this fungus.

## COW CABBAGE.

I received a packet of the seed of this extraordinary cabbage, from a gentleman of Cirencester, who brought it from Jersey, and had sown it. In his garden, I have seen five healthy plants, which

weathered last winter, in the open garden, remarkably well, and seem to be equally hardy with their congeners. I subjoin a sketch and description of this curious esculent, as supplied me in a communication from this friend.

"The above is somewhat the appearance of a plot of a variety of cow cabbage that I saw growing in Jersey. It is much cultivated there, and attains the height of from 4 ft. to 10 ft. or 12 ft. The little farmers feed their cows with the leaves, plucking them from the stem as they grow, and leaving a bunch or head at the top. The stems are very strong, and used for roofing small out-buildings; and after this purpose is answered, and they are become dry, they are used for fuel. When the gathering of the leaves is finished at the end of the year, the terminating bud or head is boiled, and said to be particularly sweet."—*John Murray.*

## ON THE CULTURE OF THE COW CABBAGE, OR CESAREAN COLE.

BY MR. BERNARD SAUNDERS, NURSERYMAN, ISLAND OF JERSEY.

SIR,—Observing an article on cow cabbage, or Cesarean cole, communicated by Mr. J. Murray, permit me, through the medium of your miscellany to offer a few remarks on the subject. Having resided in this island about twenty years, I have had an opportunity of appreciating the great advantage this variety of *Brassica* is to the small farmer as well as to the large one, and will, with your permission, give your readers a brief account of its culture and uses. The seed is sown, from about the 20th of August to the 1st of September, in a good soil, and planted out, from November to January and February, in succession, at from 20 to 30 in. distance, in a good, substantial, well manured soil; as no plant is more exhausting or requires a better soil,

but, perhaps, no one plant produces so large a quantity of nutriment during its period of vegetation. About the month of April they begin (from the first crop) to strip the under leaves, cut them in small pieces, mix them with sour milk, bran, and other farinaceous substances, and give them as food to ducks, geese, hogs, &c. During the whole summer they continue stripping the plant as above stated, until it attains the height of from 6 to 12 ft.; and, if a scarcity of herbage prevails, the green leaves form excellent feed for cows and oxen, with alternate feeds of hay and straw. The tops and side shoots are excellent at table during winter and spring.

The longest of the stalks are frequently used to support scarlet runners and other French beans, and as cross rafters for farm buildings under thatch, and have been known to last more than half a century, when kept dry, for the latter purpose.

I am, Sir, &c.

BERNARD SAUNDERS.

*Nursery, Island of Jersey, April 14, 1829.*

COW CABBAGE, OR CESAREAN COLE.—Noblemen, Gentlemen, and others who take an interest in agricultural pursuits, have now an opportunity of comparing and judging for themselves, by visiting the Bedford Conservatory, Covent Garden, where specimens of the above most excellent variety of *Brassica* have just been received from an eminent nurseryman in the Island of Jersey, and which it is presumed are similar in every respect to those now exhibiting at a perfumer's in Cheapside, and other shops in the metropolis, and for which, as we understand, a packet containing only a few seeds, a most exorbitant price is demanded.

## APPLICATION OF STEAM TO AGRICULTURE.

MR. EDITOR.—Some incorrect statements having appeared in several provincial papers, relative to a recent exhibition near Bolton-le-moors, of the application of steam to bog cultivation, as invented by Mr. Heathcoat, I should feel obliged by the insertion of the accompanying remarks, on the part of myself and those gentlemen who accompanied me to witness this interesting experiment.

I am, Sir, your obedient servant,  
HENRY HANDLEY.

26, Pall Mall, June 13.

## STEAM PLOUGHS.

The adaptation of inanimate power to the tillage of the soil must evidently have been considered by practical men to present almost insuperable difficulties, or steam would, probably, long since have been substituted for horses and oxen, as the motive power of agricultural implements. Certain light operations of the farm, such as thrashing, churning, chaff-cutting, &c., which could be performed by fixed power, have partially occupied the attention of mechanics, and suitable machinery driven by water, wind, or small steam-engines, has to some extent been advantageously used for such purposes. But the idea of a "steam farm," of a farm to be altogether cultivated by steam, in lieu of animal power, has hitherto been treated as visionary and absurd, except by a few individuals, and one or two agricultural societies, who have enforced, in their publications, the practicability and importance of applying steam to effect the more laborious operations of agriculture.

This desideratum is at length accomplished. Mr. Heathcoat, M. P. for Tiverton, the ingenious and well-known inventor of the lace machinery, has the merit of having conceived and planned this additional and remarkable contribution to science, and to the wealth of his country. The invention, after years of costly experiment, has been matured and perfected through the enterprising liberality of Mr. Heathcoat, assisted by the mechanical ingenuity and perseverance of Mr. Josiah Parkes, civil engineer, whom he selected to carry his designs into effect. The first machine has been constructed expressly for the cultivation of bogs, and has, for some months, been practically and successfully worked in Lancashire, on Red Moss, near Bolton-le-Moors.

During the Whitsuntide recess of Parliament, a numerous assemblage of gentlemen from different parts of the country attended to witness an exhibition of this novel and interesting invention; amongst whom were Mr. M. L. Chapman, M. P., Mr. T. Chapman, Mr. H. Handley, M. P., Mr. J. Featherstone, of Griffinstown-house, Westmeath (an enterprising and successful bog-reclaimer), Mr. F. Brown, of Welbourn, Lincolnshire, Mr. James Smith, of Deanston, near Stirling (well known to the mechanical world by his ingenious inventions, applied both to agriculture and manufactures), Mr. B. Hiek and Mr. P. Rothwell, engineers, with other experienced judges of mechanical contrivances. These gentlemen were unanimous in pronouncing the invention to be the germ of great improvements in the science and practice of agriculture, as well as eminently fitted for the particular purpose to which it has, in the first instance, been applied. Two ploughs of different

construction were put in action, to the admiration of the spectators; particularly the one last invented, which is double-acting, or made with two shares in the same place, so that it returns at the end of a "bout," taking a new furrow, without loss of time. The perfect mechanism of this plough—the action of the working coulters and under-cutting knives, which divide every opposing fibre of the moss—the breadth and depth of the furrow turned over—the application of a new and admirable means of traction, instead of chains or ropes—together with the facility with which the machine is managed, and the power applied to the plough, especially interested and surprised all present. The speed at which the plough travelled was  $2\frac{1}{2}$  miles per hour, turning furrows 18 inches broad by 9 inches in depth, and completely reversing the surface. Each furrow of 220 yards in length was performed in somewhat less than three minutes, so that in a working day of twelve hours, this single machine would with two ploughs turn over ten acres of bog land!

The machine which bears the steam-engine is itself locomotive; but as the ploughs are moved at right angles to its line of progress, not dragged after it, the machine has to advance only the width of a furrow, viz., eighteen inches, whilst the ploughs have travelled a quarter of a mile; in other words, the machine has to be moved only eleven yards, in the time that the ploughs have travelled five-and-a-half miles, and turned over a statute acre of land. This is, in truth, the prime distinguishing feature of the invention; it is the contrivance on which the genius of its author is more particularly stamped, and which seems to be essential to the economical application of steam to husbandry; for it is evident, that were it requisite to impel the machine with a velocity equal to that of the ploughs, by dragging them with it, a great proportion of the power of the engines would be uselessly expended.

Another valuable property appertaining to the machine, and which conduces greatly to its economy as a bog cultivator is, that it requires no previous outlay in the formation of roads, no preparation of any kind further than a drain on each side of it. That a locomotive machine of such great dimensions and power could be so constructed as to travel on mere raw bog, was an excellence the more appreciated as it was unexpected by those persons who are conversant with the soft, unstable nature of bog. The Irish gentlemen present also pronounced Red Moss to be a fair specimen of the great mass of the flat, red, fibrous bogs of Ireland, and that neither the machine nor the ploughs would have any difficulties to encounter in that country which had not been already overcome on Red Moss, the field of experiment. The engines are capable of working up to fifty horse power, but the operations subsequent to ploughing will require a small force compared with that necessary for breaking up the surface of the bogs, to the depth and at the speed effected by these ploughs. The power consumed by each plough is estimated at about twelve horses, and the weight of the sod operated upon by the plough, from point to heel, is no less than three hundred pounds. The boiler is of unusually large dimensions for locomotive engines, being suited to the use of peat as fuel, so that the culture of a bog will be effected by the produce of its drains. At Red Moss, however, coals are so cheap, being found contiguous to and even under it, that they are used in preference to turf. Eight men are required for the

management of the machine and the two ploughs, or at the rate, nearly, of one man per acre; but it must be understood that this number of men will only be required for the first heavy process, and has no relation to any subsequent operations in the cultivation of bogs, nor to the application of the invention to the culture of hard land. After passing a sufficient time on the Moss to witness the exhibition of the ploughs, and the various other functions and properties of the machine, the party expressed to Mr. Heathcoat the extreme pleasure they had received, and their earnest hope that he would extend the sphere of his exertions by applying the invention to the culture of stiff clay soils; and more especially to carry into effect those important operations of sub-soil ploughing and improved drainage recently introduced to the agricultural world by Mr. Smith, of Deanston. To effect these processes, great power is essential, and it was evident that Mr. Heathcoat's invention was equally well adapted to them, and would be attended with results no less important than those which will arise from its application to the reclamation and culture of bogs.

### SOILING.

By the term soiling, is understood the feeding of cattle in a house, shed, or fold, with cut green food, instead of depasturing the field, or making the grass into hay.

Various articles are employed for this purpose, as tares, lucern, and meadow-grass; also barley, rye, oats, and beans, all in a green state; but red clover, either alone, or mixed with rye-grass, is the substance most commonly applied.

Soiling, according to Sir John Sinclair, is attended with the following advantages:—

1. THE SAVING OF LAND.—Exaggerated accounts have been given of the saving of land. Some have contended that it is as one to seven, if not more. By accurate experiments, it appears that it may safely be stated as one to three, an advantage alone well entitled to the attention of the industrious and intelligent farmer.

2. ADVANTAGES TO THE FENCES.—Where stock are stall-fed, fences are not so necessary, and in this way there may be a saving of land, and a diminution of expenditure.

3. THE SAVING OF FOOD.—Animals destroy the grasses, destined for their food, when pasturing upon them, in many different ways:—By eating, by treading, by dunging, by staling, by lying down, and by breathing on them. Of these the first alone is useful. All the others tend to waste, and that waste is always in proportion to the richness and productiveness of the soil.

THE IMPROVEMENT OF STOCK.—This advantage is applicable to all the different sorts of stock, more especially in dry seasons, when pastures are apt to fail.

Working oxen derive great benefit from soiling. They are saved the trouble of collecting their food, after their work is over, and run no risk from noxious vegetables, or unwholesome water. They can fill themselves much sooner, and consequently have more time for rest; and they can take their repose much better, in a stable or shed, with plenty of litter, than in an open field, where there are so many things to annoy them.

The experiments of soiling cattle have likewise

been successful. Young steers become more tractable for work, and are exempted from many accidents and disorders to which they are otherwise liable. The size and the symmetry also, to which cattle may be brought, when thus kept constantly sheltered, in a progressive state of improvement, without receiving any check whatever, justifies the idea that such stock will surpass those exposed to the vicissitudes of climate, and other inconveniences inseparable from the grazing system, though pastured on fields of the richest and most luxuriant herbage.

Milch cows may also be soiled with considerable advantage; it is always expedient to soil them in the middle of the day at least, especially in hot sultry weather, that they may not be tormented with flies in the field, nor induced to stand in brooks, or ponds of water, nor in the shade of spreading trees or hedges, by which much valuable manure is lost. The stock are thus kept in a healthier state, and the milk is of superior quality. During the flush of the season the quantity of milk may be as great from good pastures; but when they begin to fall off, cattle, regularly and abundantly fed in a house, must be greatly more productive for the purpose of the dairy.

5. INCREASING THE QUANTITY, AND IMPROVING THE QUALITY OF THE MANURE.—This advantage cannot be controverted. When land is pastured, the dung that falls upon it is destroyed in various ways, and does not go through the process of fermentation. Whereas, by soiling, not only a greater quantity of rich dung is obtained, but it may be 'manufactured to more advantage.'—Besides, dung made in summer is always superior to that made in Winter, for the warmth of the weather promotes a rapid fermentation, and generates several valuable substances, the formation of which, the cold of Winter, and the superfluous moisture of that season, in a great measure prevent. By this means, also, clay land farmers are, in respect of manure, put more on a footing with turnip soils.

6. INCREASING THE VALUE OF LAND PRODUCE.—There is certainly no mode by which cultivated grasses will pay so well as by soiling. In the neighbourhood of towns, the same land will produce at the rate of from 20*l* to 25*l* per statute acre cut for soiling, which would be considered high at 9*l* or 10*l* if let in pasture. The expense of carting the cut grass must, however, be deducted.

In conducting the soiling process, the grass, whether natural or artificial, ought to be cut in the morning for the evening food, and in the afternoon for the morning mess: the afternoon crop should be carried to the barn or some other convenient place, and spread out in order to exhale its superfluous moisture; and in rainy weather, both crops must be taken off the ground. Attention, however, ought to be paid to the due proportion to be cut; and, until that fact be ascertained, it is a good plan to measure each mess, and to chalk down the quantity in weight, which the basket, cart, or other vehicle, employed for carrying food, contains of the various articles used for that purpose. The practice will, at least, have a tendency to teach farm servants to observe method, the value of which is of considerable importance in all business, particularly in the various branches that are connected with, or dependant on, a grass farm. On the supposition, therefore, that seventy-five pounds' weight of green clover will be sufficient for one beast, where thirty-two head of cattle are to be fed, 1200 pounds will be cut twice in the day; thus eight acres, cut four

times in the season of soiling, will, on an average, give one cutting in six weeks, or nearly thirty perches are cut daily. A man and a boy may perform all the work, and pay all the attention requisite in soiling that number.

That the soiling system is attended with great labour, in cutting, collecting, and conveying the food,—in feeding and keeping the stock clean,—in carrying the manure to the fields, and also occasions some expense in buildings, cannot be denied; but surely these objections are amply compensated by the advantages above detailed. In all cases, therefore, where the soil and climate are favourable to the practice of soiling, there cannot be a doubt of its utility, and the propriety of its adoption.

## COACH-HORSES.

### WHAT DO THEY THINK OF THE COACH ?

When a coach sets off again from its stoppage at an inn-door, there is a sort of freshness and recommencement; the inside passengers settle themselves in their corners, or interchange legs, or take a turn on the outside; the outside adjust themselves to their seats and their bits of footing; the young woman looks for the ninety-ninth time to her box; the coachman is indifferent and scientific; he has the ease of power in his face; he shakes the reins; throws out a curve or so of knowing whip, as an angler does his line; and the horses begin to ply their never-ending jog. A horse's hind-leg on the road, to any eye looking down upon it, seems as if it would jaunt on for ever; the muscle works in the thigh; the man at the same time dances a little bit; the hock-joint looks intensely angular, and not to be hit (it is horrible to think of wounding it;) the hoof bites into the earth; wheels and legs seem made to work together like machinery; and on go the two patient creatures, they know not why nor whether, chewing the unsatisfactory bit, wondering (if they wonder at all) why they may not hold their heads down, and have tails longer than five inches; and occasionally giving one another's noses a consolatory caress. It is curious to see sometimes how this affection seems to be all on one side. One of the horses goes dumbly talking, as it were, to the other, and giving proofs of the pleasure and comfort it takes in society; while the other, making no sort of acknowledgement, keeps the "even tenor of its way," turning neither to the right nor left, nor condescending to give or receive the least evidence of the possibility of a satisfaction. It seems to say, "you may be as amiable and patient as you please; for my part I am resolved to be a mere piece of the machinery, and to give these fellows behind us no reason whatsoever to suppose, that I make any sentimental compromise with their usurpations over us."

Horses in a coach must certainly be the most patient, or the most indifferent, or the most unthinking of animals. The mule seems to have an opinion of his own: he is not to be driven so easily. The dog passes a horrible unsatisfied time of it under the butcher's or baker's go-cart. Harnessed elephants would be inconvenient. They would be for re-adjusting their buckles, and making inquiries with their trunks, into the behaviour of the postillion. They might, to be sure, help with the other trunks, and perform the part of half horse, half ostler. The Llama of Peru has inconvenient

tricks, if you ill-use him; and so has the camel. But the horse, when once he is ground well into the road, seems to give up having any sort of mind of his own—that is to say, if he ever had any, except what his animal spirits made to be mistaken for it; for the breeding of horses is such in England that, generally speaking, when they are not all blood and fire, they seem nothing but stupid acquiescence, without will, without curiosity, without the power of being roused into resistance, except poor souls! when their last hour is come, and non-resistance itself can go no farther, but lies down to die. We dock their tails to subject them to the flies; fasten their heads back to hinder them seeing their path; and put blinkers at their eyes for fear of their getting used to the phenomena of carriage and wheels behind him. What must they think (if they think at all) of the eternal mystery thus tied to their bodies, and rattling and lumbering at their heels?—of the load thus fastened to them day by day, going the same road for no earthly object (intelligible to the horse capacity,) and every now and then depositing, and taking up other animals who walk on their hind-legs, and occasionally come and stroke their noses, kick their bellies, and gift them with iron shoes?

Well, circumstances drive us, as we drive the horses,—perhaps with as many smiling remarks on the part of other beings at our thinking as little of the matter;—so we must be moving on.—*Hunt's London Journal.*

## TO THE EDITOR OF THE MARK LANE EXPRESS.

Glasgow, June 16.

SIR,—In looking over Agricultural reports, in attentively examining my correspondents' letters, and in conversations with farmers, I am led to the following conclusions on a subject interesting to all, and which may not be unacceptable to the readers of your paper.

There are four distinct complaints of the present Wheat crop:—1st, less sown; 2nd, its lateness; 3rd, thinness on the ground, and 4th, spiry and short in the straw. The first of these is universally admitted, the second complained of, and the two last said to be very general.

Now, if only one of these four hold true at harvest, there is very little chance indeed of our having a crop equal to any of those reaped within the last four years. If two hold true, there will be great deficiency; if three, I have no doubt of very high prices; and, if all four, there is no saying how much foreign grain the country may require.

If I am wrong in my statement and deductions, I hope some of your able correspondents will put me right. There is a vigour at present in the leading Wheat markets that surprises some people, and I have attempted to explain the reason without making vague calculations of stocks and consumption.

I remain, Sir,

Your most obedient servant,

CERES.

EXTRAORDINARY SHEEP SHEARING.—Mr. Mear, of Holway Farm, Taunton St. Mary Magdalen, on Thursday last, in the space of twelve hours, sheared, in the best possible style of workmanship, the extraordinary number of *fifty-one* store ewes, the property of a respectable farmer near Taunton. The produce was 331½ lbs of clean-washed wool.

## DORSET AGRICULTURAL SOCIETY.

The General Annual Meeting of this Society was held at Blandford, on Wednesday the 15th June instant, when the following premiums were awarded:—

**INDUSTRY AND FAITHFUL SERVITUDE.**—Class 2.—Archelaus Wellstead, for length of servitude with Mr. Jas. Burgess, the first premium; John White, for length of servitude with Mr. Henry Fookes, the second premium; Mary White, servant to Mr. H. Fookes, for reaping the greatest number of acres of wheat, two guineas; Mary Cuff, also servant to Mr. H. Fookes, for reaping the next greatest number, one guinea.

**SHEEP SHEARING.**—Class 1.—Thomas Ballam, the first premium; John Harris, the second; William Harris, the third.

**LIVE STOCK AND WOOL.**—Class 1.—To J. J. Farquharson, Esq., the first premium, for the best one-year-old South-down ram; to Mr. H. Fookes, the second; to Mr. J. House, the first premium, for the best one-year-old South-down ram in the wool, shorn at the meeting; to Mr. Hott, the second.

Class 2.—To Mr. H. Fookes, the first premium for the best two-year-old South-down ram; to J. J. Farquharson, Esq., the second; to Mr. House, the first premium for the best two-year-old South-down ram in the wool, shorn at the meeting; to Mr. Hott, the second.

Class 3.—To Mr. H. Fookes, a bounty for a South-down ram of any age.

Class 4.—To Mr. R. Burgess, the first premium for the best lot of South-down ewes; to J. J. Farquharson, Esq., the second; to Mr. Hott, the first premium for the best lot of twelve South-down ewes in the wool; to Mr. Henry Fookes, the second.

**CATTLE.**—Class 1.—To J. J. Farquharson Esq., the first premium for the best pair of working oxen; to Mr. Robt. Bridge, the second.

Class 2.—To Mr. J. Burgess, a bounty for a one-year-old Devon bull; to Mr. R. Burgess, a bounty for a Durham bull of any age.

Class 3.—To Mr. Jas. Burgess, the first premium for the best pair of two-year-old Devon heifers; to Mr. J. House the second.

Class 4.—To Mr. J. Burgess, the first premium for the best pair of one-year-old Devon heifers; to Mr. House, the second; to Mr. R. Burgess, a bounty for a pair of one-year-old Durham heifers.

**FAT STOCK.**—Class 1.—To J. J. Farquharson, Esq., a bounty for a pen of six-teeth Down wethers.

Class 2.—To Mr. Hott, the first premium for the best pen of fat ewes; to Mr. R. Burgess, the second.

**EXTRA STOCK.**—To Mr. H. Fookes, a bounty for four rams and four ewes.

**SWINE.**—To Mr. R. Bridge, the first premium for the best boar; to Mr. H. Fookes, the second; to Mr. Henry Fookes, the first premium for the best breeding sow; to Mr John House, the second.

The officers of the Society were re-elected for the year ensuing.

A unanimous vote of thanks was given to the President J. J. Farquharson, Esq., for his past services and exertions in behalf of the Society. The members dined together at the Crown Inn, and the evening was spent with the greatest conviviality.

**ITINERANT AGRICULTURAL LIBRARY FOR EAST SUSSEX.**—The great benefit derived in North Britain from similar establishments, has induced some of the principal farmers, clergy and landed proprietors, to join in a subscription of half-a-crown annually for

the purchase of the Quarterly Journal of Agriculture, and Prize Essays and Transactions of the Highland and Agricultural Society of Scotland; which received its first charter from George III., in 1784, of which the Duke of Argyle was president, and the Earl of Aboyne vice-president; and the second charter from his present Majesty. In consequence of the eminent utility of this Society, not only to North Britain, but to the nation at large, of which the president is the Duke of Buccleugh, and the vice-presidents, the Dukes of Gordon and Sutherland, the Marquis of Tweedale, the Earl of Roseberry, with upwards of nineteen hundred members, including a large proportion of the noblemen and gentlemen of rank, landed property and professional eminence in Scotland; whose names being printed, as well as the list of premiums, in their 28th number, a copy of it has been sent to the printers of this paper; to Eber's Circulating Library, Brighton; Heatherley's, Eastbourn; also to the principal libraries at Hastings; and when, and wherever a sufficient number of subscribers give in their names, a separate set of the future numbers will be deposited for easy reference, with the privilege, in the order of their subscriptions of having the use of the 32 first numbers of the Edinburgh Journal of Agriculture, of which Mr. Lower, at Lewes, has taken charge; and also of any other Agricultural works, which may be added, to which subject this subscription is confined.—*Sussex Advertiser.*

**SALE OF ENGLISH SHEEP IN FRANCE.**—A sale of Leicestershire and Kentish rams, and Leicestershire ewes of the Alford flock, took place on the 5th instant. The day of sale being that of the Agricultural Club of the Seine et Oise, the graziers in the vicinity of Paris could not attend. The graziers of Picardy and of Nivernais became purchasers of 31 rams and 20 ewes, at prices from 600*l.* (24*l.*) to 105*l.* (4*l.* 4*s.*) The *Journal du Commerce* says that no sheep are so proper to improve the native breed as the Leicestershire, they being fat at the same age that the French sheep are meagre.

**CROPS.**—The appearance of the hop-yards in this neighbourhood is as favourable as ever remembered. The weather has evidently been most beneficial to them, the bine being remarkably strong, and the whole appearance of the plants being most luxuriant. The wheat is looking well in most places; and in some forward situations near this city, harvest will, probably, commence about the middle of August. Old hay is now, and has for some time been, selling in this county at the advanced price of from 4*l.* to four guineas per ton. The crops this year upon the light grounds will not, it is thought, amount to half of what they were last year.—*Hereford Journal.*

**ANNUAL SALE OF FAT CATTLE AND SHEEP at Grange Distillery Farms, Fifeshire.** This sale took place Monday 6th inst. At an early hour a most respectable company assembled, more numerous than at any previous sale. The sale commenced with the cattle, which were put up in pairs. Heavy four and five-year olds brought from 45*l.* to 50*l.* a pair. Some single bullocks sold at 28*l.* to 32*l.* The average sale of the stock exhibited was computed to be from 7*s.* to 7*s.* 6*d.* per imperial, or 9*s.* to 9*s.* 6*d.* per Dutch stone. The 450 cattle, sold at the lowest average of 18*l.* a-head, would amount to upwards of 8000*l.* After the sale of the cattle, ten score of fat sheep were brought forward, and exposed by the score. Full aged Cheviot wethers, brought 53*s.* 6*d.* a-head. Cheviot hogs, 35*s.* to 37*s.* One lot of superior wether hogs, bred from the black-faced ewe and Leicester ram, lambed on the farm of Kingside, Peebles-shire, brought 43*s.* a-head. The sale concluded about three o'clock, after which the gentlemen present, to the number of nearly 300, sat down to a most sumptuous dinner with Messrs. Young, who had provided liberally for the occasion.

## AGRICULTURAL REPORTS.

### GENERAL AGRICULTURAL REPORT FOR JUNE.

The general complexion of the whole range of vegetation since the date of our last report—notwithstanding the almost continual prevalence of cold night winds—blowing, for the most part, from the north-west, has undergone a most propitious change. This improvement has been matter of general observation during the last fortnight. We still conceive, that, notwithstanding the unfavourable rumours which have been circulated, as price spurs, by speculators in grain, &c., that the present year will be productive—making a fair deduction for the breadth of land that has been forced out of corn into grass tillage—of a full average general crop of wheat and beans, and not a very deficient one of peas, oats, and barley; though, as relates to the three latter, there may be some partial deficiencies. The growing wheat may now be considered as, generally, in full ear, and not an inconsiderable part of it in full bloom, the remainder rapidly coming into flower, thus indicating nearly, or quite, as early and equally productive corn harvest as last year. The hay harvest, too, which commenced in the early part of the present month, and in some instances much earlier, has become general, in, we believe, all parts of England, with a fair average though backward, crop of both meadow and seed hay. Hence, hay-making, fallow-ploughing, and denchering, comprise the principal farm operations of this month, with the exception of the provisions requisite for the commencement of the corn harvest. In time gone by, it was the practice of farmers to allow their sons and servants to play cricket matches between hay time and harvest, but we are apprehensive, that either the short interval between them will, this season, counteract that delightful, health-creating, amusement, or the latter will be commenced before the former is finished.

There is no sheep-rot spoken of, and every description of live farm stock is described as being healthy and doing well in the pastures; and the grass-fed beasts, that have hitherto reached our fat stock markets, though, at present, light weighers, and not over-stocked with internal fat, are fully as ripe as in the ordinary run of Junes; but most of the beasts that have been stall or close-fed, during the last winter and spring, have not, owing, probably, to the badly-harvested state of the last year's crops of hay, and deficiency of turnips, carried more than half their wonted quantity of interior fat, nor have been so externally ripe, as in the corresponding seasons of past years; whilst the large warm-woolled Lincolnshire and Leicestershire breeds, which are, for the most part, fattened upon the same kind of food as are the Norfolk beasts, have come out of their wool unusually fat, and so, indeed, do the Leicester half-breds, South-downs, and the white-faced, or Cheviot Scotch sheep.

The recent meeting of the Central Agricultural Society, at which the Duke of Newcastle presided, and which appears to have been attended by Earl Stanhope, Lords Kenyon and Wynford, M.P.'s, M.C.S.'s, &c., to the number of about 200, has excited, or provoked,—we scarcely know which word to apply—in the agricultural community much mirth, by the disputation in behalf of, and against, tithes.

The shearing of the ewe flocks on the South Downs of Sussex has commenced with both ewes and lambs in excellent condition, and the former yielding a good, heavy, and fine-textured fleece.

Many farmers appear to be much amused with the agricultural coquetry of Lord John Russell, and the theory of his colleagues in office, relative to their affairs, both of which they seem to think very averse to their interest, especially as relates to the tithes question, which they seem to most fervently wish that, on account of the head of his family being one of the most extensive lay-impropriators in the kingdom, both his lordship and a great majority of his lordship's colleagues had never had anything to do with. Neither farmers, nor any other part of the agricultural community, have ever manifested a desire to starve the church, but one and all appear to desire that lay-impropriations should be wholly abolished, and, if clerical tithes could possibly be dispensed with, a respectable subsistence allowed out of the general taxes.

As relates to the prices of farm produce, those of most kinds of grain, as also malt and flour, have been, though occasionally vacillating, in the whole, about stationary, of both fat and store stock; with wool, poultry, and dairy produce, stationary, and, in some instances, dear; with hops, hay, straw, milch cows, and horses, rather drooping.

The following is a retrospective statement of the supplies and prices of fat stock exhibited and sold in Smithfield Cattle Market, in the course of the four weeks, ending on the 20th inst.

#### SUPPLIES.

		Beasts.	Sheep.	Lambs.	Calves.	Pigs.
May	27.	650	3500	5000	270	420

Total ..		11427	89100	54000	2390	3010

Supply of preceding month.	10576	55000	24000	2130	3102
----------------------------	-------	-------	-------	------	------

By the above supplies, it appears, that those of last month embraced 851 beasts, 44,100 sheep, 30,000 lambs, and 260 calves less, 92 pigs more, than those of the present.

PRICES.—At per 8lbs sinking the Offals.

	May 27.		June 20.	
	s. d.	s. d.	s. d.	s. d.
Inferior Beef . . . .	2 10	to 3 0	..	3 0 to 3 2
Middling, do. . . .	3 4	to 3 8	..	3 6 to 3 8
Prime, do. . . . .	4 2	to 4 8	..	4 4 to 5 0
Inferior Mutton . .	3 4	to 3 8	..	3 2 to 3 6
Middling, do. . . .	4 2	to 4 6	..	3 8 to 4 0
Prime, ditto, . . . .	4 8	to 6 0	..	4 6 to 4 10
Lamb . . . . .	5 10	to 6 8	..	4 10 to 6 0
Veal . . . . .	4 2	to 5 2	..	4 0 to 5 0
Pork . . . . .	3 6	to 4 8	..	3 6 to 4 8

It will be perceived, by the above statement of prices, that those of beef were from 2d to 4d per 8 lbs dearer; of mutton—on account of the whole of the

sheep being out of the wool—2d to 1s 2d; of lamb 8d to 1s; and of veal 2d per 8lbs cheaper on the 20th of June, than on the 27th of May current year; whilst those of pork were stationary, throughout the month.

	June 22, 1835.		June 20, 1836.	
	s. d.	s. d.	s. d.	s. d.

SUPPLIES.

	June 22, 1835.	June 20, 1836.
Beasts	2,147	1,950
Sheep and lambs	24,010	26,200
Calves	271	300
Pigs	394	380

It appears, by the above comparison, that beef was from 2d to 1s; mutton, 10d to 1s 2d; veal, 6d to 8d; and Pork, 6d to 8d per 8lbs dearer; lamb, 2d per 8lbs cheaper, on Monday June 20, 1836, than on the corresponding market day last year, viz, June 22, 1835; whilst there were 197 beasts, and 14 pigs less; 1,190 sheep and lambs, and 29 calves more, on the former, than the latter market day.

From the 27th of May to the 20th of June, present year, about 755 of the beasts forming the supplies of Smithfield and Islington markets, came from Lincolnshire, Leicestershire, Northamptonshire, up the St. Albans' road; about 850 up the other northern roads: about 935 from the western and midland districts; about 5,666 from Norfolk, Suffolk, Essex, and Cambridgeshire, but chiefly from the former county: about 2,660 by sea—principally by steam vessels—from Scotland; about 202 from Sussex, Surrey, and Kent; and the remainder, including about 145 lusty town's-end cows, from the marshmen, cattle-lodges, cowkeepers, &c., in the neighbourhood of London.

The following are the supplies of fat stock, exhibited in Islington New Cattle Market, on the days of their respective dates.

	Beasts.	Sheep & Lambs.	Calves.
May 27.	72	250	—
— 30.	789	1,796	6
June 2.	85	545	11
— 6.	670	2,140	7
— 10.	89	634	3
— 13.	375	2,718	7
— 17.	74	645	4
— 20.	334	2,566	10
Total	2,488	11,294	48

The chief falling off, of the last two month's Smithfield supplies, is partially ascribed to the supplies of Islington market, being generally derived from Smithfield's original sources, and partially to the bad quality, in Norfolk, of the last year's growth of hay, and a deficiency of winter and spring turnips.

From the commencement of the shorn sheep, from our northern districts, particularly those from Lincolnshire and Leicestershire, they have been unusually prime, and are now in the height of their season. The South Downs too, are, with the generality of the lambs, for the most part—as, indeed,

are all the polled breeds of sheep, excepting yearling wethers, or teggs, though not so fat as we have seen them in June,—strong and healthy.

Nearly, or quite, two-thirds of the month's beasts have consisted of Scots, fattened either in England or Scotland; the remainder, of about equal numbers of Herefords, short-horns, and Devons; with a considerable number of Norfolk homebreds, Sussex and Irish beasts, and lusty cows.

About three-fifths of the month's supply of sheep have consisted of new Leicesters, of the South Down and white-faced crosses; about a fifth South Downs and old Leicesters; and a moiety of the remainder, of Kents, Kentish and Norfolk half-breeds; the rest, chiefly of horned Norfolks and Dorsets, horned and polled Scotch and Welsh sheep, &c.; about 1,900 of them coming alive from Scotland.

The lambs have been, for the most part, South Downs and new Leicesters, with a considerable number of Dorsets, Kentish half-breeds, &c.

A great deal of slaughtered meat has reached the metropolitan meat markets, from Scotland and the north and west of England, in the course of the month; also a considerable number of live pigs, from Ireland; but how many, from the manner in which they are stowed away, in different parts of London, it is impossible to ascertain.

SUFFOLK.

The unfavourable weather experienced during May threw a gloom over our expectations with respect to the growing crops; the wind continuing in the east and north-east all the month, accompanied by frosts at night, prevented, or at least severely checked, vegetation. Since the commencement of the present month we have had some refreshing showers, with a much more temperate atmosphere, so that the appearance of the crops, and indeed the entire face of the country, are changed almost as if by magic.

The wheats, we are nevertheless fully persuaded, will be light in bulk, and although many pieces appear very luxuriant to pass by, yet nineteen out of twenty will not bear an examination. Barleys are looking well, with but few exceptions, and should a continuance of favourable weather ensue, the prospect is decidedly better than that of wheat; of oats we may make the like observation. Beans and peas are at present looking healthy; the former are somewhat short in the straw, but if they doth escape the louse (of which we entertain a doubt, as thistles, roses, &c. are much infested with them), there may be a tolerable crop. Clovers are very short, and their having began to head before the rain and warm weather occurred, the first crops will be very light. Grass, also, from the same cause, is short, and the bulk of hay must be light. Winter vetches, although during the winter they were very promising, are but a meagre crop. Trifolium is nearly a total failure; we, however, would not recommend its culture to be wholly abandoned, which perhaps is not sufficiently understood at present; it is evident, in the majority of cases in which it failed, it was owing to not being sown sufficiently early for the plant to get strong to stand the severity of winter; an instance we noticed, and which confirmed this opinion, was where some trifolium was drilled between the rows of stubble directly the field was cleared of wheat, the haulm was left standing during the winter, which protected the young plants from the severity of the weather; that piece is as beautiful a crop as we wish to see, indeed we have not seen a piece of clover anything like its equal.

The rains have come very opportunely for mangel

wurzel and Swedes, of which we consider, particularly of the latter, a greater breadth than usual to be planted, as it was known by experience during the last three months the value of mangel, where they were fortunate enough to secure a plant.

Stock generally has not done well, for want of sufficient feed; all kinds of cattle, however, are commanding fair prices. The markets for corn are firm at remunerating prices, which we hope and believe will continue.—*June 17.*

#### CUMBERLAND.

The weather of late has been quite to extremes; during the month of April it was unusually wet and cold; for the whole of May, and till about the end of the first week of the present month, it was extremely dry, with cold frosty nights, accompanied with northerly or eastern winds. Vegetation made but slow progress, and, as may be expected, grass is unusually scarce. Cattle have suffered much from want; first, from the want of hay; and now, from the backwardness and shortness of the pastures. Last week the wind got round to the south-west; since then, we have had many fine rains. Vegetation is now making rapid progress, and, it is to be hoped, that stock will soon have plenty of keep. Hay must now be a very light crop, particularly the sown grass, and it cannot be estimated to produce more than one-half an average crop. Wheat is very backward, it will be light in straw, particularly upon the cold lands. Oats and barley look better than could be expected, and may, from present appearance, be a good crop. Potatoes are doing badly, many fields are a complete failure, and the seed is decayed. We have had fine weather for turnip fallows, and it is now a suitable season for sowing. Beef and mutton very scarce, and likely to be so for some time to come; in consequence of the scarcity, fat cattle and sheep command high prices. Wool sells very well, and at much the same prices as was obtained last year. We have also a good demand for grain, prices are fully one-third higher than they were during the winter, but the rise in price only benefits a few; a great number of the farmers, for want of money, sold all they had at the low prices.—*June 15.*

#### LINCOLNSHIRE.

The fine showers which are so generally reported to have visited nearly every other district of England in the early part of this month, have never fallen on the eastern side of this County, in sufficient quantity, to benefit the grass land, before yesterday; when we had a steady, mild, and searching rain of several hours duration; which is this day succeeded by a warm dull atmosphere, highly beneficial to vegetation in general; and will prove a timely succour to our feeding pastures. The meadows will be much benefitted, although it has come too late to create any thing like abundance. The small showers which fell partially during the last fortnight have restored the colour of the corn generally, which now appears healthy, and the barley having very much improved, may approach to an average crop. The wheat is breaking into ear upon the warm soils too early, and before a sufficient length of straw has been produced, and in like manner, the oats, thus portending but little bulk either in corn or straw. The beans are short and slender in the stem, but will be greatly benefitted by this change, and may yet be an abundant crop. The operations upon the fallows in cleaning, manuring, and preparing for turnips, have been brought into a forward state by the long continuance of dry weather, and as the seed sowing has commenced, and will be completed (or nearly so) in the next fortnight, there is every prospect of

a full crop, unless there should be a return of frosty nights, as from the general system in this county of drilling bones, burned soil, and other compost with the seed, it vegetates and grows so rapidly as to be soon out of reach (in this stage) of its only enemy, the fly. Clover mowing has not yet commenced, but will become general in another week, with the prospect of turning heavy under the scythe. Sheep-shearing is going on in full vigour, and the flocks generally bare in good condition. Wool is selling freely at from 37s to 40s. per todd of 28lbs. Fat sheep are in abundance, and lower in price. Beef scarce, and consequently, the trade brisk, at full 6d. per pound, sinking the offal.

The trade for wheat and oats, considering the prospect, and a harvest three weeks later than for years past, does not rule so speculatively as might be anticipated, though it is tolerably steady, at 48s. to 54s. for wheat, and 20s. to 24s. per quarter for oats. In barley nothing doing. What wheat remains in stock will not be thrashed out until nearer harvest, as it is in the hands of those farmers who can wait for coming events.—*June 22.*

### HOP INTELLIGENCE.

(FROM THE MAIDSTONE GAZETTE.)

MAIDSTONE.—We are sorry to say that the improvement of the last week has not equalled our anticipations, or the progress of the week before; excepting in the "crack" grounds of this immediate neighbourhood, the Farleighs, Barming, &c. The thunder-storm and heavy showers of Sunday, however, must do great good, although their effects are not yet perceptible. In many other districts we find they are much improved.

EAST SUTTON.—In some of the low grounds the mould has made its appearance. Mr. Payne of this place has a piece of land, which for the last two years has been subject to this discouraging disease. On finding that, last week, it again made its appearance, he exhibited a degree of decision, worthy of "the great Captain" himself. Although the vines had been tied, and were several feet up the poles, he immediately had them all grubbed up, and the field re-planted with something else.

GOUDHURST, HAWKHURST, ROBERTSBRIDGE, SANDHURST, NORTHAM, BECKLEY, AND BENENDEN.—The bine has much improved in these districts, and now looking healthy and well. The late showers may be expected to effect a still further improvement.

TICEHURST.—In this and the surrounding parishes, there is scarcely any fly, and the bine improved considerably during the past week.

CANTERBURY.—Since our last report, the fly has made its appearance in many grounds, but without materially altering the favorable appearance of the plantations.

HORSMONDEN, YALDING, AND BRENCHELY.—The vines on these parishes, during the past week, have made great progress; but it is thought that the rain of Sunday was by no means beneficial to them.

HOPS IN FRANCE.—BAILLIFUL, June 15.—The late fine weather has been very favorable to the growth of our hops, and prices are consequently tending towards a decline. The present quotation is 72½*f.* to 77½*f.* per 50 kilogrammes, equal to 58s. 2d. to 62s. per English hundred weight. At Alost, the price is 48*f.* to 53*f.* answering to 39s. 2d. to 42s. 4d. per English cwt. At Poperingue the currency is 47*f.* to 50½*f.*, or 37s. 7d. to 44s. 4d. per cwt.

## AGRICULTURAL INTELLIGENCE, FAIRS, &amp;c.

**MAIDSTONE FAIR.**—The fair was very badly supplied with stock; there were plenty of buyers for lean stock, which consequently fetched an advanced price. Horses were numerous, but no buyers.

At **HAVERFORDWEST FAIR** there was a good show of black cattle and horses, both of which were quickly bought up at considerably advanced prices.

**BOROUGHBRIDGE FAIR.**—The show of good horses was only thin, which made them command high prices. Horses of an inferior description were more numerous and met with a ready sale. In short, good horses of every kind were never known to fetch such high prices as they did at this fair.

**ABINGDON FAIR** was pretty well supplied with horses, cows, and sheep; the trade was tolerably brisk for superior things, while the inferior were, as usual, more difficult to dispose of. Colts were not so numerous as they generally are, while the show of cattle we thought of rather a higher order than we often see at June Fairs. Hacks were in abundance. Lambs were in demand—1 pen fetched one guinea per head.

**TARBOLTON JUNE CATTLE FAIR.**—There was an average show of stock, and in consequence of the growth of pasture from the late rains, the demand was a good deal brisker than at recent fairs in the district. Good cows brought from 10*l* to 14*l*; and two-year old queys from 4*l* to 6*l*. A very fine two-year old quey in calf, was sold for 12*l* sterling.—As usual, there was a good many bulls, which were nearly all sold.

At **DUNSMUIR TRYST** there was a fair show of cattle, for which the sellers demanded high prices, which caused a stiff sale; but ultimately the parties came to an understanding, at prices nearly similar to those at Trinity Muir last week. The best sorts of cattle were nearly all sold; but small stirks stood long, and a good part remained unsold. The best quality of fat brought from 5s 10d to 6s 3d per imperial stone. Calving cows sold briskly at nearly the same money as fat.

**KEITH MARKET.**—There were about 4,000 cattle on the market green on Wednesday last, and a number of dealers from all parts of the country were present. The demand for lean cattle was dull, but fat stock readily obtained purchasers. A lot of well-fed four-year olds, fit for the London market, were sold at 11*l* a-head; and a lot of that age, belonging to Mr. Findlater, Balveny, which were of a superior description, sold at 16*l*.—About 50 three-year olds, in good condition, were sold by one dealer, at a price averaging about 9*l* 10s a head. Mr. Burgess of Phoness sold 14 very fine stots, also three-year olds, at 10*l* a head; and Mr. Gauld of Parkhall sold a very superior lot, of the same age, so high as 13*l*. Generally, however, the prices obtained for stock of this age averaged from 7*l* to 10*l* a head. For good two-year old stots from 6*l* to 8*l* were readily obtained. Several lots of three-year old queys were sold at 7*l*; and others of more weight brought from 8*l* to 9*l*.—Two-year old queys sold at from 4*l* to 6*l* a head. Towards the afternoon there was an excellent show of horses on the green. Good draught horses brought high prices—say from 25*l* to 30*l*, and one very superior animal was sold for 35*l*. There was a great number of good roadsters shown, the prices of which varied, according to quality, from 14 to 30 guineas.—There was an extraordinary demand for ponies, and the few good ones that were shown were readily bought up, at very high prices. Upon the whole this market is said to have been extremely favourable to the sellers, as very few of the black cattle in good condition were left unsold.

**NOTTINGHAMSHIRE.**—This month was ushered in with cold north winds and frosty nights, which continued until about the fifth or sixth; the vegetable world wearing a most drooping aspect

from want of rain and warm weather. Some farmers had already commenced mowing—in particular situations—the drought sooner retarding vegetation than promoting it. The wind then veered round to the south, and south-west, accompanied with thunder and heavy rains, (which however fell partially) but came too late for the spring seed crops, which are found to be very light. The weather continued hot and with but little rain until about the fifteenth or sixteenth, since then we have had thunder and heavy rain; but speaking generally, the ground has not been perfectly saturated. There is great scarcity of grass—the effect of the drought—the mow crops are certain to fall very light. Wheat is looking very healthy, the greatest complaints being a want of root; still, if the weather continues favourable it may prove a yielding crop. Beans have suffered generally from the want of rain. Early sown barley and oats are looking tolerably well, but those which were sown later have suffered severely from the dryness of the season. The fields appear very irregular in their growth, and patchy, one part appearing as though sown later than another. Dills this year have proved a very abundant crop, and the farmers must now have learned to estimate the value of them, there being such a scarcity of grass, from the dryness of the weather. The lucerne was a fine crop, and has proved very beneficial to the farmers; but I think they do not know the full value of it, or it would be more generally cultivated. The Swedish turnip plants are generally looking extremely well, whilst the white turnip plants are a little affected by the fly, but if the rain continues are likely to be a good crop. The hop bine is looking healthy, being free from filth. The Corn market to-day, June 23rd, at Mansfield was very dull; our market, may now properly be termed a weather market. S. P. G.

**DERBYSHIRE.**—Immediately after my last report the last week in May and the commencement of June, we had very cold weather, frosty nights, accompanied with sharp north winds, without rain; we suffered very much, particularly on the limestone lands. About the end of the first week in this month we had a change of weather, the wind then turning and blowing from the south, accompanied with thunder and showers. We had then hot dry weather until after the end of the second week. Since then we have had a good quantity of rain, but still not sufficient. The wheat crop towards the south of the county is looking tolerably well, much better than towards the north, but still there is a scarcity of root throughout the county. Oats and barley in the south of the county are looking very unkind from the dry weather. Lentils have proved a good crop, and from the extreme dryness of the season are proving very serviceable, and the farmer now sufficiently appreciates them. Upon the rocky parts of the county there is a scarcity of grass, by the river sides and on the lower lands there is a fair quantity, but generally speaking there is a great scarcity. The artificial grasses are falling very light; the natural grasses if the weather proves favourable, I think will prove a better crop. The corn market at Alfreton to-day, 24th June, was rather depressed, there was very little doing; but few sales being effected, the farmers holding firm at last week's prices.—24th June. S. P. G.

## COW CABBAGE.

TO THE EDITOR OF THE FARMER'S MAGAZINE.

SIR,—The accompanying letter we received this morning, and as it contains information with which the public should be made early acquainted, allow us to call your attention to it, and to request that you will give it insertion in your next publication.

Sir, we are

Your most obedt. servants,  
CORMACK, SON, & OLIVER.

New Cross, June 24, 1836.

*Peterboro', 24th of June, 1836.*

GENTLEMEN,—Having seen a paragraph this afternoon in a London newspaper inviting gentlemen and agriculturists to inspect a specimen of the Cow Cabbage, or Casarean Cole, at the Bedford Conservatory, I trust it will not be uninteresting to you to have an account of the *thing* which is making such a blaze in the agricultural world, by the name of the Casarean Waterloo Cow Cabbage, and now exhibiting at the Perfumer's by Mr. Fullard.

Mr. Fullard is a farmer, living, when at home, near ten miles from Peterboro', in Thorney Fen. About three or four years ago, a gentleman of Peterboro' asked me to get him the Casarean Kale he had heard so highly spoken of, and I procured an ounce of it from a respectable London house, and he took a part, but made nothing of it; a part, however, was sold to a Mr. Whych, of Portland, eleven miles from hence, with whom it succeeded tolerably well, and Mr. Ullit, I believe his son-in-law, raised about five plants also, and they are the plants now exhibiting in London. The produce from them was 3lbs of seed, which he sold to Mr. Fullard for 7l. 10s., and which is the very identical seed he, Mr. Fullard, is creating such a sensation in London and all parts of the country. This account you may rely upon, being correct, as I had an interview with Mr. Ullit a fortnight ago on the subject, when I gained the particulars of it from himself. I wrote last week to the London seedsman who sent me the seed, and I had their answer on Sunday morning, stating, that the description I had given them of the Waterloo Cabbage man afforded them a rich treat, inasmuch as a more complete agricultural hoax had never been palmed on the gullibility of John Bull. You may make what use you please of this letter, but I think one should give publicity to these proceedings,

for I assure you it is really a fine piece of ridicule in the neighbourhood where he resides, and I have every reason to suppose that Mr. Fullard never saw the plants while growing, but I feel satisfied you will see at once that the seed in question is nothing more than the Casarean Cole or Jersey Kale.

Gentlemen, I am, Your's respectfully,  
Messrs. Cormack, Son, & Oliver. JOHN WHITE.

## REVIEW OF THE HOP TRADE.

JUNE.

This month came in with a considerable demand for Hops for the trade, as well as speculation; the first week we continued to experience cold easterly winds, with frosty nights, as in April and May, and the bine then looked very weakly and unpromising. The duty was estimated at 150m. About the 10th of the month the wind shifted round to the south-west, and we had warm nights with showers; this still continues, and it is surprising the good effect it has already had on the plant, more particularly on the strong lands throughout Mid Kent.

Some fly have appeared, but not to any alarming extent; the wind continuing rather too strong for their remaining long on the plant. We are in hopes they will leave us without further mischief. Mould is talked of, but it is early days for that destructive ravager. We presume it is merely anticipated by the large holders of stock, certainly it may be found, but it is principally in the hedges at present.

The estimated duty is now quoted from 200 to 250m. with every disposition to advance higher.

The price (as might be expected with the favourable appearance of the coming crop), has fallen considerably, fully 15 per cent upon the quotations in May, and at present the market is very unsettled, some of the holders taking alarm, sell at even a greater reduction than this.

## REVIEW OF THE CORN TRADE

DURING THE MONTH OF JUNE.

The mild cloudy weather experienced during the latter part of June, accompanied with heavy showers of rain, have been extremely favourable to the growth of vegetation; the reports from various counties continue to represent the appearances of Barley as luxuriant, and in some districts holding forth the promise of an exuberant produce. Oats look also well, but in some instances are thin, and the straw likely to be extremely short. The accounts of wheat are, however, upon the whole, less satisfactory; for though the plant has made rapid progress, yet there are many situations where the stems are shooting up spindly and weak, and a much less number of straws attached to the root than usual; though, on the other hand, it may be said that there is time for the head still to fill well, and yield a full

even grain. The straw also in many cases will be extremely short. Beans and peas are extremely vigorous and healthy, and if the former pod satisfactorily, will prove an abundant crop.

In Scotland, the prevalence of cold, frosty, ungenial weather, particularly during the nights of the month of May, has created radically more injury to the grain, than the sunny weather now experienced can ameliorate, and that the produce, under any circumstances, will be below an average return. Wheat, as well as barley and oats, are represented as progressing favourably, but that the harvest will be much later than usual, and therefore the quality, and even quantity of the grain secured, will be rendered the more precarious, especially in the more northern divisions of the kingdom. Beans and peas look well; but

potatoes have in many instances missed, and apprehensions are being entertained for the result of the crop of this valuable esculent, which every year is becoming more indispensable to the country, having entered in such an extended ratio into general consumption; and in many cases, when calculating the consumption of grain in the kingdom, due estimation is not made for the extensive substitution of the article in the place of flour and meal, especially as regards England and Scotland.

In Ireland, the drying winds and chilly atmosphere have been succeeded by a milder temperature and beneficial rains, which have materially improved the aspect of the fields; wheat has much improved, but is still reckoned deficient, which in addition to the diminished breadth sown, will render the produce below an average growth. Barley and oats require more wet, and are extremely backward. The drought has been detrimental to the growth of flax, which appears thin and stunted, and unless favoured by a succession of warm showers, will, it is to be feared, prove a deficient crop, though the additional quantity under cultivation this season, will render the produce at all events more than equivalent to the previous year. Reports are beginning to be made of a partial failure in the potato crop, but it is to be hoped that the miss will not be so general as to affect the aggregate average.

Much interest is still experienced as to the currencies of grain, and many queries propounded as to their future tendency; the subject is one on which it is extremely difficult to offer an opinion at all likely to be generally coincided in, as it is liable to bias in the minds of speculators, holders, and vendors to a considerable extent: the only attempt, therefore, that could be made would be to offer a range, which might be reasonably expected under a certain set of circumstances, avoiding extremes and following the classic advice, "in medio tutissimus ibis," recollecting that all arguments or opinions from statistical accounts or grounded on former occurrences connected with the grain market, must, in a trade which assumes such *Protus* shapes, set at defiance all the calculative powers of theory and practice, as to the eventual results, more especially in a climate liable to such constant vicissitudes. Past experience proves, and in many instances too fatally, that where collateral circumstances have induced speculative enterprise, and seemed to combine in ensuring success, a sudden turn or event has occurred, which rendered nugatory all theoretical speculation however previously well defined.—With a succession of favourable weather, and the combined powerful effects of heat and moisture, many holders may be induced to send their samples more freely to market, and a tendency may thus ensue towards a reduction in the prevailing currencies, and white wheat may recede to 52s and 54s, and red to 46s and 48s, though below this range there does not appear at present much reason to anticipate a reduction. Sanguine speculators on the other hand are entertaining themselves with the notion that white wheat may arrive at 70s. The farmers, however, who consult their ulterior interests, should be far from wishing such a rate of currency to prevail, particularly if they entertain the belief, that the present code of laws regarding grain are the most beneficial for their protection. If 70s should be attained, the market will be inundated with foreign wheat and re-action will take place, more detrimental to their future condition than the temporary profits realized by the advance; at the same time that so high a range of the quotations might prove instrumental in favouring a revi-

sion of the Corn Laws, by the people demanding "with one fell swoop" a permanent or *ad valorem* duty, which would be determined from a lower rate than under ordinary circumstances, the farmers might otherwise have confidently expected to have obtained. Prices of barley will, in all probability, maintain their existing currencies, and are liable slightly to improve, say 1s to 2s per qr on the averages, making the duty 12s 4d, or as an extreme case 10s 10d per qr, when the admission of the foreign article will check all chance of additional enhancement, more particularly as the promise of the forthcoming crop is luxuriant. The state of the oat market, with the favourable character of the weather and the reduction of the duties to 10s 9d, has materially lessened the chances of prices attaining a higher range this season unless some unforeseen casualty occurs to the crops; as the extensive supplies latterly received from Ireland and the foreign oats entered for the consumption, in addition to the stocks still remaining in the Sister Isle, which the assistance of the Agricultural Banks have enabled holders to retain. Beans and peas, with the appearance of the crops more than usually productive, and the influx of foreign supplies now daily arriving, and being entered on the market, will cause a gradual decline in both articles until the duties advance sufficiently high to prevent the introduction of foreign samples, when the new crop will, in all probability, be at hand for the consumption.

At the very commencement of the month of June the absence of rain and cold chilly weather caused an advance of 2s to 3s per qr; warm showers, however, and sunny atmosphere succeeding this ungenial state of the temperature, checked speculative feeling, and millers confined their operations to their immediate wants; at the same time the supplies continued moderate, and though slightly exceeding the demands, did not allow sufficient accumulation of stock to depress materially the currencies; and, as the bulk of the wheat on hand in the country is held by farmers and landed proprietors capable of retaining their stores, and who generally from the appearance of the crops on the land entertain a favourable opinion towards old wheat, the markets are not likely to have any influxes of the article to an extent to force down the quotations; and though prices have receded from their extreme rates, yet they are 1s higher than at the close of May, with a firmness in the trade, which will require large receipts to weaken.

With the exception of the shipment of a few hundred quarters of bonded wheat to Cherbourg and Portugal, there have been few purchases for actual export. Holders however have advanced their demands, and the finest high mixed Danzig and Königsberg wheats are not to be obtained under 36s to 38s 1d; good high mixed, 32s to 35s; red mixed, 30s to 32s; Mecklenburg, Pomeranian, and Upper Elbe qualities 28s to 32s. Extensive purchases have been effected at Königsberg, Danzig and the whole lower line of the Baltic, on British account with the view of warehousing in *loco*, prices varying at the two first ports from 24s to 34s, and even higher, according to quality; at Stettin 27s to 29s has been obtained; at Mecklenburg 26s to 29s, and Holstein 25s to 28s; at Hamburg 27s to 28s 6d.

During the first week of June, the prices of ship's Flour receded 1s to 2s from the highest rates of the previous month, since, which, though the trade has been languid, owing to the wharfs being tolerably well filled, and bakers being unwilling during the warm weather to increase their stocks beyond their immediate wants, prices have not sustained any further depression; town made qualities remaining

nominally unaltered. Bonded flour has continued to meet attention, and some large parcels have been shipped, principally to the West Indies, Mauritius, Hobart Town and Cape of Good Hope, and the currencies of the month of May have been fully supported. There have been several arrivals of flour from the Elbe and Baltic, principally however, from Danzig, the quality of which proves superior, especially WITTS' brands, which appear likely to attain a pre-eminent station on the market as to quality, and become the favoured mark of speculators; the samples are held at 22s to 23s per barrel.

The averages have continued to exhibit the gradual improvement in the value of the different species of grain: wheat has advanced on the aggregate average 1s 9d; 6d on barley, 1s 8d on oats, 2s 10d on beans, and 1s 1d on peas, reducing the duties on wheat, 3s, on barley 1s 6d, but on this article only for one week, having since receded from 12s 4d to 13s 10d; on oats 3s; beans 4s 6d, and peas 3s. With the exception of barley and wheat, there appears little probability of the duties declining lower on any other article this season, and on the former the extremest reduction will not exceed 10s 10d, or more likely 12s 4d.

The arrivals of barley have been less than even the limited supplies of the preceding month, and have not exceeded 11,900 qrs. The malting season having closed, the sale has been confined for distilling and grinding barley, and as the demand has more than kept pace with the receipts, prices have improved, distilling qualities having realized 33s to 35s, and grinding descriptions 32s, Irish samples being worth 30s. The exhaustion of the stocks of the article in this country, has induced a speculative feeling in favour of foreign qualities, and several parcels have been bought for English account at 17s to 19s per qr; bonded samples having advanced 1s to 2s per qr, the better sorts being held at 22s. The duty which receded for one week to 12s 4d induced the entry of a few hundred qrs, but relapsing again to 13s 10d, the further entry was checked, though there is little doubt the duty will again recede to 12s 4d, and the possibility exists of its attaining 10s 10d on the approach of harvest.

The receipts of malt have been less by 6,000 qrs than those during the month of May. The brewers having been well in stock, has caused the extent of business transacting in the article to be extremely limited, prices however remaining nominally unaltered.

An increase the past month is exhibited in oats, of 58,017 qrs: the augmentation from Ireland having been 51,000 qrs, and from Scotland, 11,000 qrs, but in the imports from our own coast there has been a falling off of 4,100 qrs. In the early part of June the supplies not being adequate to the consumption, holders were enabled to realize at an advance of 1s to 1s 6d per qr; the sales however were principally confined to needy customers; the wholesale dealers and consumers, as the month advanced, anticipating large supplies from Ireland, refrained from purchasing. About the 13th the wind having at length become favourable caused the simultaneous arrival of various vessels, and the influx of the article was to a greater extent within the time, than had been expected; factors, however, willing to hold out, would not submit to a greater reduction than 6d to 1s per qr, which purchasers not acceding to, the amount of business was less considerable than it would otherwise have been. Further supplies, however, being known to be on their voyage, prevented dealers from acceding to the demands; in addition to which the advance of the aggregate average of the

kingdom to 24s, and the consequent decline of the duty to 10s 9d, enabled the holders of fresh arrived foreign oats to offer them free upon the market which had the effect of checking the trade, and preventing purchasers from coming forward, until they could ascertain to what extent the admission of oats was likely to be carried; factors therefore had no option but to accede to a reduction of fully 1s 6d per qr, and even at this decline the business was only limited, making the trade for Irish 1s 6d to 2s per qr lower during June, for Scotch potato about 1s, English having fluctuated, but maintaining the same rates at the close as at the beginning of the month. Several sales of bonded oats had been made at 15s for Danish feed, and 14s for Archangel quality; Dutch brew 16s to 18s; fine 19s. The offers from Ireland advanced to 13s and 14s 6d, but have latterly receded, and Limerick were to be obtained at 12s 9d to 13s 6d; Waterford 14s, being a decline of 6d to 1s per barrel.

Beans in the beginning of the month hung on heavy, owing to the prospect of the reduction of the duties, which, as they gradually took place, rendered the article difficult of disposal, and when foreign qualities were admissible at a duty of 11s, the number of parcels pressing on the market had the effect of forcing prices down 3s to 4s per qr, and the trade heavy at this decline, as the appearance of the crop is highly promising. The supply of foreign beans during the month have amounted to about 6,100 qrs, and on the 5th of June, there were in bond, in London, 5,299 quarters.

The same remarks as the above apply to peas, white qualities having receded 5s to 6s, and maple and grey, 2s to 3s, with a very limited demand; the duty remaining as low as 9s 6d per qr. The quantity in bond in London, at the commencement of the month was, 5,736 qrs, and during June we have received about 6,100 qrs.

During the month of JUNE the following quantities of grain and flour have arrived in the port of London.

	Wheat. qrs.	Barley. qrs.	Malt. qrs.	Oats. qrs.

By the latest advices from VAN DIEMEN'S LAND, it appears that heavy rains had fallen, and laid much of the Wheat, and that smut prevailed to a considerable extent. About 2,000 qrs of Wheat had been received from the East Indies, but prices remained steady, at 6s to 7s per bushel. English barley 5s 6d per ditto. At Launceston wheat was noted at the same rates, and Barley, 5s to 6s 6d. The new crop which was in progress of being secured, was represented as thin on the ground, and the ears small, yet in consequence of the increased quantity of the land sown this year, which was estimated at 3,767 acres, there will be several thousand bushels left for export; in addition it is reckoned there are 1,800 acres more, cultivated with barley, and 250 acres with oats.

At SYDNEY, the continued drought up to harvest had rendered the wheats thin and unproductive, and all kinds of fodder were extremely dear. Wheat was still maintaining high prices, notwithstanding the harvest, being noted at 10s to 12s 6d per bushel for the finer qualities, and 30s per 100lbs for flour. Considerable imports of wheat had been received from Hobart Town, Launceston, and the East Indies.

In CANADA the weather had been very changeable, suddenly altering from heat to cold, but vegetation and sowing had not been much impeded; little difference existing the present year as to their progress compared with other seasons. The water communications with Upper Canada had opened, and supplies had been received. At MONTREAL some Baltic red fine wheat had been sold in Auction at 5s 6d, and Archangel, at 5s 3d per 60lbs. Flour was steady, at 29s 6d to 30s per barrel.

In FRANCE the winds which have prevailed have worked much good to the growing crops; Wheat however is variously reported, many statements tending to prove that the thinness of the plant prevents the possibility of the weather effecting much improvement; and that the produce will be below an average, even under the most favourable circumstances. Summer grain has materially benefitted from the change in the weather. At the ports of *Chorbourg, Gramville, St. Malo, St. Brieux, Brest, Lorient*, in fact at all the ports from the Department of Calvados and Cape Barfleur to the river Vilaine in the Bay of Biscay, the duties have further receded, owing to the increased ratio of the averages; and wheat in British vessels is admissible at a duty of only 3 francs 50 cents per hectolitre, or 2 francs 25 cents., if in French bottoms, with the addition of 10 per cent., making the duties per qr. in the former case about 8s 3d, and in the latter 5s 3d per qr. or thereabouts, according to the exchange. At PARIS, the tendency in the quotations was to decline, and the trade ruling dull; at many markets in the Northern and Western Departments, however the extensive shipments to the Southern parts of the Kingdom had nearly exhausted the stocks in the more immediate circle of the ports; and the receipts therefore, to meet the consumption were limited, and prices supported.

At St. PETERSBURG, Rye was in request, but the stocks too limited and prices too high to admit of the execution of orders. The reports from the different Governments were, with few exceptions, favourable for Winter sown corn, but natural and artificial feeds were very scarce owing to the cold and drought. At RIGA, Courland wheat remained nominal at 23s to 26s 10d; barley, however, met purchasers at 17s 4d to 18s 10d. Oats were noted at 12s 1d to 13s 1d. A few parcels of crushing linseed had been sold at 43s 6d to 49s. At KÖNIGSBERG, the dull accounts from London had made no impression on the market, neither holders nor farmers being willing to accept lower terms; high mixed being held at 32s to 33s; good new mixed, 25s to 26s; middling, 23s to 24s. Barley scarce at 15s to 16s; oats in active demand at 10s to 12s as in quality. Rye had been much in request for Norway, Danzig, Bremen, and Belgium and prices had advanced from 15s to 17s. In the advices received from the above City are some judicious and pertinent observations respecting the purchases of wheat; speculators devoid of local knowledge regarding Königsberg and Danzig, forgetting "that there is nought in a name," prefer transmitting orders to the latter City, and purchasing an article, which very likely has been already shipped from Königsberg; and as prices, owing to the celebrity of "Danzig wheat," range higher at this market, they

pay frequently 3s to 4s per qr. more money for their fancy and deficiency in the knowledge of localities; whereas, no wheat is grown near either port, but is transported from Poland; the only difference existing being that the craft laden with one parcel floats down the river *Vistula*, and the other down the *Pregel*. At Danzig a good deal of animation has pervaded the market owing to the continued orders from this country, and some purchases made on French account: fine white wheat has been bought at 34s to 35s; fine high mixed, 31s to 32s; best mixed new, 27s 7d to 28s 6d; inferior, 24s to 25s; flour, first quality, 18s; latterly however, increased supplies and less inclination to purchase, had reduced the quotations of wheat fully 1s to 2s per qr, and even more on some qualities. An active demand had prevailed for rye, which had advanced from 15s to 18s; and large purchases had been effected at the intermediate rates. Considerable purchases also of oats had been effected, principally at Elbing at 10s to 11s 6d, but prices receded to 10s and 10s 6d. Rape plants had suffered from insects, but the weather generally was favourable for vegetation. At STETTIN the currencies for Marks wheat remain steady at 28s to 29s; rapeseed on delivery of the new crop was held at 32l. At ROSTOCK, as well as WISMAR, the prices of wheat, owing to the continued demand for England, had further advanced the quotations of the best samples, which were not to be obtained under 28s to 29s; oats, 13s to 14s; barley, 17s to 18s. At the former port, rye had improved in value, and was noted as high as 22s, in consequence principally of the unpromising appearance of the crops, which had been much injured by the cold weather. Oats were also represented as likely to be a short produce, and the large portion of the new rapeseed had been already sold on delivery. At KIEL as well as LUBECK holders were asking higher rates for their wheats, and rapeseed on delivery, 31l to 32l. At HAMBURG the trade was dull at the date of the last advices; several sales of wheat, however, had been effected the foregoing week at the top rates; quality weighing 62lbs to 63lbs was worth 28s 6d; other descriptions 27s to 27s 6d. Saale barley has been sold at 19s. In oats less doing, and Swedish and Danish might have been bought at 11s 9d, weighing 38lbs to 39lbs; black oats of 36lbs to 37lbs 11s 3d. New rapeseed deliverable at Hamburg had been sold on delivery at 31l, and on the Baltic at 30l 5s to 30l 12s 6d per last.

WOOL MARKETS. BRITISH.

There has been several wool fairs in the past week, which have been well attended, but in consequence of the reduction of price the previous week in the York, and other markets, the north-country manufacturers and wool staplers have not been so brisk in their purchases; and the local buyers begin to feel the result of the two former years, viz., after buying the wool at the various fairs in June and July of the growers at liberal prices, have been obliged to submit to a loss of

1d, 2d, and in some, losses of 3d per lb, in August, September, and the Autumn months; and those who could not hold their stocks till the Spring, having suffered materially, are now beginning to see they have given too high prices, and seem disposed to make a stand for a reduction, which must take place to some extent considering the immense importation of all sorts of wool from nearly all parts of the world. The colonial wool will have the preference of all other wool, English wool being so much crossed for weight of carcase as well as weight of wool, there is hardly any pure breed of any kind.—June 27.

SCOTCH WOOL.—The public sales of foreign and colonial wools, which commenced yesterday, have collected an unusually large attendance of the trade. Wools of every description have met with ready sale at very firm prices, and Scotch wools have participated in the increased demand, as far as the limited stock would admit. We do not alter our quotations, but note an increased disposition to do business in every class of Scotch wools.

FOREIGN.—The public sale of wool to-day has commanded a larger attendance of dealers than any previous sale which has taken place in Liverpool. There was a large attendance not only of dealers from Yorkshire, but from all parts of the kingdom. The first sale consisted of 1,068 bales of New South Wales wool of favourite marks, the first lot of which brought 2s 10d per lb. This is an advance on the prices realized by the same marks last year of 2½d per lb. 148 bales of East India varied from 4d to 11½d per lb; 200 bales of Spanish were offered which brought full prices, as also 34 bales of German. Odessa, fine, 2s to 3s 6d; Portugal R., 1s 5d to 1s 7d; Portugal, low marks, 1s 0½d to 1s 2½d; Spanish R, 2s 6d to 2s 9d; Spanish, F.S, 2s 2d to 2s 4d; German fleeces, 2s 2d to 2s 6d; German assorted, 2s 6d to 2s 9d; German lambs, 2s 6d to 3s 6d; New South Wales, 2s 4d to 3s; Russian wool, 8½d to 9½d; Buenos Ayres, 4d to 5½d; Mogadore and Barbary, 4½d to 6d per lb. Import for the week, 1522 bales; previously this year, 11,687 ditto.

FOREIGN.

JUNE 25.

About 1,950 bales of Colonial, South American, German, and Turkish wools have formed the supplies of the past week. The prices of last week's public sales—the whole of which were well attended—were—Van Diemen's Land wools from 1s 1d to 3s 1d; Australian, 1s 2d to 1s 10½d; Cape do, 1s 8d to 2s 2d; German do, 1s 9d to 2s 8d; and Russian do, 1s 8d to 2s 5d per lb; which prices, allowing for difference in quality, were about the same as were those of the city sales of the preceding week. But little business is doing, by private contract, at about last week's currency.

BONES.

# THE POLITICAL COMPANION

TO

## THE FARMER'S MAGAZINE.

[Our object in appending a Political Companion to the Farmer's Magazine, was to put our readers in possession of the opinions of the most talented journalists of the day, on *both* sides of any important question which might come under discussion. We trust, therefore, that in giving insertion to articles, which seem opposed to the agricultural interest, we shall not be considered as acquiescing in the doctrines therein advanced, our sole purpose being to enable our readers to estimate the truth or detect the fallacies of the arguments advanced.—ED. FARMER'S MAGAZINE.]

### BEEF-ROOT SUGAR.

(From the Mark Lane Express.)

Among the numerous schemes of the day, there is one to which the attention of Agriculturists is particularly invited by many of our cotemporaries, and pointed out by them as well calculated to repay for capital invested. We are fully satisfied that the intentions of the Journalists so recommending "THE UNITED KINGDOM BEET-ROOT SUGAR ASSOCIATION," are good, they are actuated by the praiseworthy motive of benefiting the agricultural community. The same spirit actuates us, and having the same object sincerely at heart, we feel it our duty to caution our readers from embarking their capital in any such scheme. The circumstances under which the manufacture of Sugar from Beet-root has grown up in France, are totally different from those in which England is now placed. During the long war between England and France, England, then mistress of the seas, prevented the importation of Colonial produce into France, and the latter being especially a sugar-consuming nation, was compelled to adopt a surer means of supplying herself with that indispensable article of consumption—Sugar. Attention was directed to the manufacture of Sugar from Beet-root, every encouragement was given to it, and the high price to which Sugar had attained operated in itself as a very large bounty for its production. Fostered by these adventitious circumstances, the growth of Beet-root, and the investment of a very large capital, and obtained to an extent which could not have been anticipated. At length a termination was put to the war, the ports of France were thrown open, and the Beet-root growers of France found themselves in competition with the Sugar-growers of the West Indies. As in all cases of forced production, they found themselves unable to compete with success, and the Government, unwilling to see a stop put to the manufacture of an article which employed so much capital and labour, imposed a protecting duty upon Colonial Sugars, by which means alone the Beet-root Sugar Manufacturers of France are at this moment enabled to produce the article. With all the advantages of low rents, cheap labor, the absence of tithes, and other imposts, and sugar at as high a price as it is in this country, the French Beet-root Sugar Manufacturers cannot make the article without a protecting duty. Supposing, for the sake of argument, that our superior system of husbandry could compensate for the above enumerated advantages pos-

essed by the French Agriculturists, and the duty now paid upon sugar in England would afford an equal protection to that which is paid on sugar imported into France; let us look for an instant at the probability of such protection being continued. Experience has shown, in a manner too conclusive to be doubted, that a reduction of duty upon articles of general consumption, very materially increases consumption. Of this the article of Coffee may be cited as a remarkable instance. The fact admitted, and the principle recognized by financiers of all parties, what security is there that the duties on East and West India Sugars may not be reduced. Such a reduction would operate at once as an encouragement to the growth of Colonial Sugars, and a discouragement to the manufacture of Beet-root Sugar. Moreover, it has been satisfactorily proved, however much it may answer the purposes of some parties to dispute the fact, that Sugar manufactured from Beet-root does not possess proportionably such a strong sweetening power as Colonial Sugar. As well might an attempt be made to grow vines in England, for the purpose of making British Wine, to supersede Wine produced in warmer climates. Besides, the scheme is bad in principle. The British Colonies form an integral part of the British Empire, and any attempt to produce, at an increased cost, in one part of the Empire, an article which can be procured cheaper from another part of the Empire—the growers there taking articles produced by us in return—is a positive error. Labour to the extent of the increased cost farming, would require ~~the~~ <sup>erecting</sup> this new branch of the necessary apparatus, which, seeing the uncertainty of the result, would be a speculation in which no practical farmer would be warranted in indulging. Moreover, it would completely change the system of husbandry adopted on the farm, be it what it may, and should the result not realize expectations, it would take several years to restore the land to its regular course of crops. But it may be said the Beet-root Sugar Association will purchase Beet-root from the farmer, and manufacture it upon their own premises. To this proposal there is also a serious objection:—The increase in the growth of green crops proves the benefit of the alternate system of husbandry, one of the most important advantages of which is the production of a larger supply of manure upon the farm. The demand for bone-manure, and all other articles for fertilizing the soil, which can be compressed into a small compass, furnishes additional evidence of the advantages found to

result from the obtaining manure, when freed from the heavy cost of carriage. To render the sale of Beet-root to the manufacturers of Sugar *off* the farm, beneficial to the farmer, the manure produced by cattle, consuming the refuse, must be brought back, and hence, except in some particular instances, will serious evil arise, not only from the expense of cartage, or other conveyance, but also from the temptation to sell Beet-root without returning such manure at all. From all the consideration we have been able to give this question, we feel convinced that no practical farmer can embark in the undertaking with any prospect of success, and "The United Kingdom Beet-root Sugar Association" will turn out a failure. If there be a body of capitalists, not farmers, who are disposed to try the experiment, let them become tenants of a farm of some two or three thousand acres, let them erect their apparatus on the premises, and manufacture the article on the spot where the Beet-root is grown, and if, after two or three years experience, the plan is found to answer, they will have received remuneration, in the shape of interest, for the outlay of their capital, and the British farmer will then be enabled to determine how far it may answer his purpose to adopt the plan. In the absence of such proof, we trust no *tenant* farmer will be lured into trying the experiment at his own risk. We by no means object to the establishment of the Company, we only desire to caution the man who has rent to pay, and who labors to subsist himself and family upon the fruits of his labor and industry, from being led astray by the speciousness of a scheme, which, from its having seemingly succeeded in France, would appear to be based upon a solid foundation.

### COUNTY RATES.

MOTION OF MR. HUME, TUESDAY, JUNE 21.

Mr. HUME presented petitions from the parish of Mary-la-bonne, from Stafford, and from Hertford, praying for an alteration in the present mode of assessing, levying, and controlling the expenditure of the county rates. The hon. member then proceeded in conformity with the motion he had given, to move for leave to bring in a bill to allow the rate-payers of counties to elect a certain number of persons to assess, levy, and expend the county rates, and to perform those duties having reference to the financial expenditure in quarter counties now exercised, as was not that check on the the people had a right to demand, and this arose from the inherent defects of the present system. The legislature had permitted the inhabitants of the corporate towns and cities to elect persons to have the control over the municipal taxation, and also to recommend magistrates, but the inhabitants of the counties had no privileges of the kind. The House was aware that the present mode of assessing and levying the county rates had been investigated before a committee up-stairs, and the report of that committee showed to what extent abuses prevailed in the present system. With a view to illustrate the want of control possessed by the county rate payers, the hon. member then read the following statement:—

Statement of the Population in the Cities and Boroughs of Great Britain, which send Members to Parliament, the greater number of which recommend their own Magistrates through their councillors. Also the Population of the Counties where the Magistrates are appointed by the Lord Lieutenants, the people having no choice or control.

### These recommend Magistrates.

	No. of Cities and Boro's.	Population at the Census of 1831.	No. of Electors enrolled 1832.
England .....	185	4,754,742	274,649
Wales .....	14	196,311	11,319
Scotland .....	76	865,007	31,322
Great Britain..	275	5,816,060	317,290

These have no power to recommend Magistrates, nor are they consulted.

	No. of Counties.	Population at the Census of 1831.	No. of Electors enrolled 1832.
England .....	40	8,336,263	344,564
Wales .....	12	609,871	25,815
Scotland .....	30	1,500,107	33,115
Great Britain..	82	10,446,241	403,494

Total population of Great Britain, 16,262,301; number of electors, 620,784; number of county magistrates, 18,984. If the population of the five metropolitan boroughs, 1,118,725, be deducted from the aggregate of represented cities and boroughs, amounting to 5,816,060, there will be only 4,697,335 actually with magistrates of their own choice. And if the population of the five boroughs be added to the county population of 10,446,241, the total will be 11,564,966; viz. the proportion in cities and boroughs, 28 88-100; proportion in counties, 71 12-100.

It appeared, then, that, in round numbers, there were 11,500,000 inhabitants of counties who had no share in the management or control over the expenditure of county rates, nor the right to appoint the county officers. One of the chief objects which he had in view in bringing forward the present measure, was to give to the inhabitants of counties the same power, as regarded the control over their local or municipal taxes, as was possessed by the inhabitants of corporate towns and cities. (*Hear, hear.*) It appeared by all the evidence taken before the committee that there were no regular rules as to the mode of assessing in various counties, and that it varied in each, and very often there were several methods pursued in the same county. Under these circumstances it was utterly impossible to tell on what principle the present system rested. It often happened in many counties that large masses of property were never assessed for the purpose of local taxation; and while the county rates that the persons who contributed to it did, they did not pay any thing to it. It was utterly impossible that justice could be done under such a system, when inequality prevailed to such an extent. This inequality prevailed to a great extent in the county of Middlesex, and also in all the parishes in the neighbourhood of the metropolis. As an illustration of this part of his argument, the hon. member read the following statement of the unequal assessments of the metropolitan districts to the police rate:

Acton contributed .....	two-thirds of rack rent.
Barnes .....	net value.
Battersea .....	full, or rack rent.
Christ Church, Surrey .....	two-thirds of ditto.
Clerkenwell .....	something less than rack rent.
Fulham .....	five-sixths of assessment.
Greenwich .....	four-fifths of rack rent.
Mill-end Old Town .....	three-fourths of assessment.
Paddington .....	four-fifths of ditto
Perge .....	2s 6d per £ on assessment.
Poplar .....	seven-tenths of rack rent.
Putney .....	between three quarters and seven-eighths of rack rent.
Ratcliff .....	seven-eighths of rack rent.
St. Anne, Limehouse .....	two-thirds small and four-fifths large houses.
St. Anne, Westminster ..	four-fifths.
St. Mary, Stratford, Bow.	seven-eighths.

His object was, as much as possible, to equalize the assessments, and to assimilate the mode of rating in different counties. At present there was not the slightest attention paid to the valuation, for the purpose of assessment. It appeared from the report of the committee of last year on county rates that the valuation was made in—

- 18 Counties on the Property-tax,
- 20 Do. on the actual value, or some proportion thereof,
- 13 Do. not known,
- 1 Do. on the 12th of Geo. III.

52 Counties.

The estimates for valuation various. Example:—By the 55 Geo. III., for equalising county-rates, a return was ordered and made. In Lancashire the difference was great.

Example,	1814.	1829.
In Liverpool .....	£584,687 ..	£751,126
In Cheetham .....	8,529 ..	24,090
In Preston ..	34,936 ..	80,984
In Bolton District .....	169,673 ..	320,467

In Lonsdale, South side..	172,501 ..	159,362
Do. North side .....	105,655 ..	123,003

All kinds of property should contribute equally to the county rates. Example of the inequality—

In Warwickshire land pays .....	£107,143
Do. mills and factories .....	2,720
In Leicestershire land pays .....	108,330
Do. mills and factories .....	783

Inequality:—Weymouth does not pay 6d to the county-rate of Dorset; 40 Inclosure Bills in Dorset, and these new lands pay no rate. Many places claim exemptions from county-rate.

Again, the county-rates had increased to an enormous extent within the last few years. As a proof of this he would refer the House to a statement made in the report of the House of Lords on this subject in 1834. In that report there was a comparative statement showing the increase that had taken place in a number of items of county expenditure since 1792. The hon. member then read the following paper:—

Summary of the Expenditure of the County Rates in England and Wales, in 1792 and 1832, or for such year as could be obtained nearest to such period, under the several heads, with the increase and decrease of each.

HEADS OF CHARGES.	Expenditure.		Net Increase	Increase per Cent.	
	1792	1832		Total	In England
1. Bridges, &c.....	4225	£...	£	..	..

Increase.....	£482,495				
Militia, deduct.....	14,860				
	£467,635				

£467,635 Increase 148 per cent.

He would proceed to examine a number of the items in this table. With reference to County Lunatic Asylums,

he could not help observing that, after the excellent mode in which the poor law bill had worked, that it would be better to place these asylums under the control of the commissioners of poor laws than leave them to the management at Quarter Sessions. He thought also that every prison in the country should be placed under the control of the crown, and under one uniform system of management, and that the expenses of the prisons should be defrayed by the public at large, and not out of the county rates. By such arrangement the expense would be materially diminished, and a much better system than prevailed at present would be adopted.

He would now proceed to lay before the House the statement which he had drawn up of the relative expense charged on the county rates, of prosecutions at assizes and prosecutions at sessions, in the year 1832, in thirteen counties in England and Wales, taken at random. The statement ran thus:—

County.	Number Tried.	Expense.		Expense per Head.		Number Tried.	Expense.		Expense per Head.		
		£. s. d.	£. s. d.	£. s. d.	£. s. d.						
Derby .....	43	832	19	0	19	80	£. s. d.	10	2	7	
Hants .....	104	1942	1	0	18	166	894	18	4	5

ASSIZES, 1832.

SESSIONS, 1832.

From this statement the House would at once perceive how superior would be the advantage, and how great the saving, of trying all cases before local courts sitting periodically. The statement of expenditure under the three foregoing heads, in five counties, taken at random in 1792 and 1832, stood thus:—

Counties.	Bridges.		Gaols.		Prosecutions	
	1792	1832	1792	1832	1792	1832
Berks .....	£ 7	£ 605	£ 448	£ 5015	£ 109	£ 1390
Surrey .....	370	290	1931	15402	217	3165
Stafford .....	298	5668	2601	7102	102	6006
Devon .....	1712	2110	3221	3603	153	2975
Suffolk .....	613	302	628	2973	9	3258
Total Expenditure in five Counties.	3000	8975	8819	34101	590	16704
Showing an increase per Cent.....		199		284		2371

Again, of late years the expense of county officers of all descriptions had been very much increased. The in-

crease per cent. in the salaries of various county officers, from 1792 to 1832, in five counties, taken at random, would appear from this table:—

	Trea- surers	Chap- lains.	Sur- geons.	Sur- veyors	Governors of Gaols.	Houses of Correction
Cornwall .....	355	59	..	185	1027	..
Devon .....	614	21	43	375	350	166
Hants .....	174	48	..	114	113	211
Leicester .....	56	..	..	47	79	84
Somerset .....	454	2	97	..	..	..

The duties of treasurer in particular might be most efficiently fulfilled by any banker in the county, and the whole expense of that officer saved. The hon. member proceeded to say that one great objection in the present system which he wished to see removed was the payment of officers by fees. He thought that in all cases the officers ought to be remunerated by a fixed salary. His great object was that the judicial and financial affairs of every county should be separated. The financial affairs should be committed to the management of a county board, composed of a certain number of persons elected by the rate-payers of the county, or their representatives, the existence of such board being limited, say to three years. This board should, immediately upon their powers and election being verified by the sheriff, proceed to select a chairman, and then to appoint the county officers, and the county magistrate should be permitted to exercise no interference whatever in levying the rates. (*Hear, hear.*) The judicial business of the county might for the present be left to the Lord-lieutenant, and the justices of the county. The adoption of such a plan as he had suggested would produce the good effect of dealing out equal justice to the county constituency with that which had been dealt out by the municipal bill to the town constituencies. (*Hear, hear.*) It might be said, "Why don't you make use of the new poor-law unions for your purpose?" But he had no hesitation in saying that he was decidedly opposed to such an idea. In the first place, unions were continually being formed from parts of one county and parts of another. Another there was, that the poor-law guardians were elected under a plurality of votes, and had a variable qualification at the will of the poor-law commissioners, who were appointed by the Crown, and thus county affairs might be influenced by the poor-law commissioners and by the Crown. Besides unions were not yet established over half the country, and his wish was to extend the now proposed measure over the whole country at once. The country was anxious for the change, and he trusted that there would be no opposition to its being brought into operation. He would therefore move for leave to bring in a "Bill to separate the financial from the judicial affairs of the counties in England and Wales, and to authorize the rate-payers in counties to choose representatives to form a county board for the management of the financial affairs of the county in England and Wales."

## POOR LAWS—IRELAND.

(From the Courier.)

The evidence taken by the Commissioners for inquiring into the state of the Irish poor, though it has not, perhaps, communicated any thing that was not previously known, has developed various features in the condition of the people, the existence of which would not have been generally believed on an inferior authority. One of the most important of these is the extreme difficulty experienced in most parts of the country in ejecting a tenant. The peasantry have, in fact, completely succeeded in many extensive districts in establishing themselves as a sort of co-proprietors of the soil. Though they should not be able to pay their rent, and even in cases where they hold only from year to year, still they have acquired

a kind of tenant right; and it is, generally speaking, impossible to eject them without having previously purchased this right, or, as it is called, the "good will" of the out-goer. This, which is as much an article of sale in three-fourths of Ireland, as Three per Cent. Consols are in London, is neither more nor less than a guarantee of quiet possession to the succeeding occupier; and any one who should venture to come into the place of an ousted tenant without having obtained this indispensable requisite, would be marked out for vengeance, and would most probably pay with his life, or the destruction of his property, for his unpardonable offence! It is not the ejected tenant merely who would feel himself aggrieved by such a proceeding. In a country like Ireland, where there are no poor rates, and where the few employments that are carried on are already glutted with labourers, land is indispensable to existence, ejection from the smallest patch seldom failing to entail the extremest privations on the party and his miserable family. Hence the desperate tenacity with which the cottiers cling to their little farms. And as the ruin that has overtaken one to day, may, if unavenged, equally overtake others tomorrow, they have seen that it was for their interest to combine together by force to protect the occupant. It is quite a mistake to suppose, as many do, that the Irish are wantonly savage and destructive. Nine-tenths of the outrages that have disgraced their country, have mostly been the result of calculation and foresight, not of recklessness and sudden impulse. They have grown out of the efforts of the peasantry to protect themselves from ruin—efforts forced upon them by the conduct of their landlords and of title proprietors, and by the want of any refuge for the destitute other than death or robbery.

It is extraordinary the landlords should not long since have opened their eyes to the inevitable consequences of this perilous state of things. Whether it may be still possible to put it down, and to restore to the landlords that controul over their estates that is essential to the introduction of good husbandry, and to the improvement of the country, is more than we can undertake to say. But the system is gaining strength every day; and it is quite obvious that if it be not speedily eradicated, it will end by making the peasants the proprietors of the soil. From inability to eject a tenant, except by his own consent, to inability to enforce payment of rent, there is but a short step; and should that step be taken, there would be an end to the present distribution of property in Ireland. The question then arises, how is this formidable difficulty to be obviated? Different answers have been and may be given to this question. But, for our part, we are clear that the establishment of poor laws, under proper conditions and limitations, would do more to break the cottier confederacy and to restore the empire of the law, and the right to dispose of property, than anything else that can be done. Were a refuge established for the destitute, ejection from a potatoe garden would cease to be followed, as at present, by the ruin of the ejected family. They would be provided for at the public expense, till an outlet could be found for them in the colonies, or in some way at home. The stern necessity that at present compels the peasantry to resist the law, being, in this way, obviated, they would learn to respect its authority; and that security that is the first and most indispensable condition to the growth of national prosperity, would be, for the first time, introduced into Ireland.

## TURF INTELLIGENCE.

Fortunately for the genuine sportsman, he is enabled to turn a deaf ear to the discordant jarring of political strife; and we make no doubt the Duke of Wellington feels much happier in the hunting field than in the senate: not that he shines brilliantly in either place perhaps: in regard to the latter we can speak to the point: the Duke is a very indifferent horseman; in the language of the school "he is no scratch over a country;" and therefore, when fox hounds can run with their heads up, his Grace is "no where." However, although we are no politicians, we are very glad to perceive that in these all reforming days, the proceedings of the turf are very likely to undergo that scrutinizing revision, which, in the name of justice, in the name of common or ordinary honesty, has been long most imperiously demanded. Let us not be misunderstood: the preceding remarks are not applicable to the owners of horses, or to the book men, but to those functionaries, who, in the form of Committee men and Collectors of "base lucre," contrive to pocket a considerable portion of the money which ought to be applied to very different purposes. One of the hebdomadal prints, a few weeks back, brought a direct charge of pecuniary malappropriation against the "self-appointed Committee for the Management of Epsom Races," and even accused the Baron de Teisseir of going snacks in the cross-diverted plunder. Is it possible that this gentleman, descended from an illustrious line of the ancient and high-minded Noblesse of France, can shelter himself from so serious a charge beneath the murky and suspicious cloak of a sulky and saturnine taciturnity? The Baron de Teisseir, the steward of one of the first meetings in the kingdom for a number of successive years, (ever since the recession of Mr. Maberly) cannot remain silent under the charge of pecuniary embezzlement! We know the Baron; we know that his powers of perception are remarkably acute, that his mind is uncommonly elastic and active, that he is altogether actuated by the most genuine impulses of human nature and the principles of honour; and therefore, although the Epsom Committee may have been guilty of swerving, we feel well assured this well descended member of society will emerge from the charge, like virgin gold from the crucible of the alchemist, brighter from having been subjected to the ordeal of investigation.

The Management of Ascot Races has been made the topic of public animadversion, though the charges have not been so systematic, so glaringly apparent, or so powerfully

expressed as those with which the Epsom Managers have been so directly and so very pointedly charged. Enough, however, has been stated, we should suppose, to induce Mr. Jemner to place before the eyes of the public, an unqualified statement of facts, which shall at once exculpate this highly respectable individual from the taint of mal-administration.

Fortunately for the welfare of the Turf, the revision of what may be called the common law of racing transactions requires no application either to the House of Lords or the House of Commons, and therefore the reform, or rather the removal of abuses, should be commenced with the least possible delay; an investigation of the conduct of many of the Turf official functionaries, we have long been well convinced, is highly necessary; and we earnestly recommend those who undertake the inquiry to divest themselves of all influential feeling except the legitimate anxiety of radical, unflinching, and unqualified reform. For the basis of their proceedings, let them first take into consideration the very great expense of bringing a horse upon the turf: let them recollect that more than one-half the foals which are dropped never come out as racers; that of those which reach the starting post, the cost is very heavy: the expense of the sire is very considerable, while a similar observation will apply to the rearing and treatment of the foal, in all the successive stages till it comes into the hands of the trainer, when, taking into consideration not only its keep, but saddlery, and the various items of expence, and the weekly amount will average two guineas, if not more. Therefore, on account of the enormous expence indispensable to bringing racers upon the course, let the reformer use the pruning hook unsparingly, and not only lop off the larger rotten branches, but also cut away the leech-like suckers of nomination fees, entrance money, as well as an endless variety of semi-swindling etceteras. Why, in the name of all that is just and reasonable, should two hundred pounds be deducted from the amount of the Derby and the Oaks? "To defray the expence of extra police," we are told: why is such a gross imposition allowed, such a system of plunder tolerated with the undeniable fact placed in juxta-position, that such an enormous sum as from fifteen hundred to two thousand pounds is collected on the Downs, from the Marquee man, the victuallers, and the other sources of pecuniary emolument which the ground presents? The great stakes just mentioned are raised by the owners of the

quadrupedal candidates who appear in the list, not one farthing is added from the multifarious and aggregately large pecuniary collection at which we have just glanced; but out of which, for racing purposes, the most contemptible trifle is annually appropriated, which, for the late meeting did not nearly amount to two hundred pounds! And yet what would Epsom be, and the business of Epsom amount to, without the races?

We would have the salaries of all the racing functionaries, such as the Clerk of the Course, the Judge, &c. paid from the "fund" and not filched from the owners of the horses; since, taking into consideration the very heavy expense necessarily incurred in breeding, rearing, and keeping these animals, they ought to come to the starting post free from those pecuniary imposts which are now so generally and so rapaciously levied upon them.

Goodwood races commence on the 27th (of July), but they excite very considerable attention at the present moment, on account of the importance necessarily attached to them. No establishment is conducted more liberally, or with a more masterly hand, than the races under consideration; they receive the influential support of the greater part of the leading nobility and persons of distinction in the kingdom; and, therefore, while they offer the richest Cup in the country for competition, the list contains various stakes of much more than ordinary amount: we give the following as a specimen: "The Goodwood Stakes of 25 sovs. each, 15 ft and 5 only if declared," &c., for which the following are the acceptances:—

	st. lb.		st. lb.
Rockingham, 6 yrs	9 12	Advocate, 4 yrs	7 3
Bran, 5 yrs	9 4	Burlington, 4 yrs	7 3
Hornsea, 4 yrs	9 1	Tauntonian, 4 yrs	7 3
Rush, 5 yrs	8 12	Felix, 4 yrs	7 3
Ascot, 4 yrs	8 7	Venison, 3 yrs	7 3
Bamfylde, 4 yrs	8 7	Jacob Faithful, 3 yr	7 3
Aurelius, 4 yrs	8 7	Ruinous, 4 yrs	6 13
Lucifer, 4 yrs	8 7	Tiber, 4 yrs	6 12
Knobstick, 4 yrs	8 5	Oak-apple, 4 yrs	6 12
Barney Bodkin, 6 yrs	8 0	Alfred, 3 yrs	6 12
Silenus, 4 yrs	8 0	Lady Anna, 3 yrs	6 12
Outcast, 4 yrs	8 0	Sepoy, 3 yrs	6 10
Luminary, 4 yrs	3 0	Toss-up, 3 yrs	6 7
Pussy, 5 yrs	7 12	Brookland, 3 yrs	6 4
Louisa, 5 yrs	7 12	Arbaces, 3 yrs	6 0
Changeling, aged	7 12	Taglioni, 3 yrs	6 0
Roadster, aged	7 12	Oberon, 3 yrs	5 12
Elis, 3 yrs	7 12	Brother to Delight, 3 yrs	5 12
Firman, aged	7 10	F by Emilius, out of Flush, 3 yrs	5 3
Whimsical (late Buccaneer), 5 yrs	7 7	F by Vanish, out of Fortuna, 3 yrs	5 3
Morpeth, 5 yrs	7 3		

If Goodwood be remarkable on account of the superior value of its Cup and Stakes, it is equally distinguished for the nicety with which the nags are weighted: thus, should the winner of the Derby start for the Goodwood Cup, 8lbs extra is placed upon him; while the second horse for the same stake would have to carry 3lbs extra. To the winner of the previous Gold Cup at Ascot, seven

extra pounds are allotted; and for the second place in the same race, the nag would have to carry 3lbs extra, &c. &c. The following is a list of the nominations for the Goodwood Cup, with the weights attached:—

Three year olds.		Hornsea, 8st 10lb
Bay Middleton, 7st 12lb		Aurelius, 8st 10lb
Jacob Faithful, 7st 4lb		Ainderby, 8st 10lb
Elis, 6st 13lb		Valentissimo, 8st 10lb
Alfred, 6st 13lb		Lucifer, 8st 10lb
Emmelina colt, 6st 13lb		Aristocrat, 8st 5lb
Sherry, 6st 13lb		Silenus, 8st 11b
Sepoy, 6st 10lb		Bamfylde, 8st 1lb
Mus, 6st 10lb		Five year olds.
Venison, 6st 10lb		Touchstone, 10st 2lb
Neva colt, 6st 10lb		Paris, 9st 4lb
Fair Jane, 6st 9lb		Louisa, 9st
Esmeralda, 6st 6lb		Bran, 8st 13lb
Weazle, 6st 6lb		Linda, 8st 2lb
Taglioni, 6st 6lb		Six year olds, and aged.
Khylan, 5st 6lb		Rockingham, 10st 1lb
Four year olds.		Diana, 8st 12lb
Elizondo, 9st 6lb		Firman, 8st 10lb
Luck's-all, 9st 1lb		Rupert, 7st 12lb
Knobstick, 9st 1lb		Eleanor, 7st 8lb
Sheet Anchor, 9st 1lb		Sophy, 7st 5lb
Felix, 9st 1lb		

The preceding list, it will be perceived, contains the names of most of the best horses in the country; and should Bay Middleton, Elis, Sheet Anchor, Touchstone, and Rockingham come out for it, expectation will be strained to its utmost tension. Touchstone beat Rockingham at Ascot (for the Cup) with the greatest ease; and, although the weight for Goodwood Cup is much against Touchstone, still, we are of opinion, that he would be more than a match for Rockingham. Bay Middleton must feel the extra 8lb which he earned by his triumph on Epsom Downs; and from the present complexion of this highly interesting race, it might be supposed that Elis or Sheet Anchor would be very likely to appear first to the winning post. However, it has been rumoured that neither Elis nor Touchstone will go to Goodwood; but we are seldom inclined to give implicit confidence to mere report relative to the turf; and, on the present occasion, can perceive no reason why Touchstone should absent himself from so important a stake—unless, indeed, his noble owner thinks it unwise to risk the well earned fame of this justly celebrated horse with seven pounds extra on his back. Such reasoning, however, will not apply to Elis, as the weight which is allotted to him (6st 13lb) cannot be deemed an overload, particularly if we bear in mind that at Newmarket he ran Bay Middleton to half a head, and would come against him with nearly a stone in his favour. If Elis be in good form he ought to make his appearance at Goodwood; but, as we have repeatedly remarked, a racer is always liable to fly to pieces; while Elis (a three-year-old) may not have recovered from the effects of his severe struggle against Bay Middleton.

## THE PLATE.

A Description of "TOUCHSTONE," the subject of the Engraving, will be found at page 99.

### ON AGRICULTURAL CHEMISTRY.

BY THOMAS SHAPTER, M.D.

No. II.

"The deficiency among Agriculturists is not so much, perhaps, in experimental, as in scientific knowledge. It is without doubt true, that there may be, and indeed are, good practical farmers, who have but little pretensions to science: but it were too much to assert that even these, however good, might not become better; that they have reached the maximum of improvement; and already discovered the means of obtaining from Nature the utmost which it is in her power to bestow."

On the importance to the scientific farmer of an intimate knowledge of the composition of the soils he has to manage and to improve, and of the manures which he adds to them, there can be but one opinion; for, until such knowledge be acquired, he must remain in ignorance of those physical changes and new combinations which are effected by a judicious admixture of them, the results of whose operations he knows to be advantageous only by long and often dearly-bought experience.

In order to prosecute such an enquiry as the consideration of these subjects must entail, it may appear, perhaps, to the generality of readers, that the more natural course to be performed would be, first, to investigate the composition of the various soils, and afterwards, that of the manures; but I have here preferred commencing with the latter, as I think it will much simplify the subject by preventing repetition, and enabling me, when speaking of the composition of the soils, to allude to the manures which are applicable to them.

The term *manure*, taken in its most extended meaning, includes every matter whereby a soil may be improved, and rendered capable of yielding an increase of nourishment to the plants committed to it, and by which their growth is promoted: wherefore all those substances which, by being placed in juxtaposition, or by being filtrated through their tissues, merely excite the organs to perform more actively the functions of nutrition, come under this denomination, as well as those matters which may wholly in themselves, or in part by their elements, pass into the plant, and, by becoming a component part of its composition, add essentially to its growth and increase. According to this extended view, various products of the three kingdoms of nature would come within the denomination.

But, in a definition so comprehensive, many substances are included, which, I think, can scarcely come within the ordinary acceptance of the word;

therefore, I shall use the term manure under certain limitations.

Chaptal, in his Treatise on Agriculture, divides manures into *nutritive*, which are those which furnish juices and nourishment to the plant, and *stimulative*, which are those substances, as above stated, that only excite the organs to perform their natural functions in excess: we may say that this latter class stands in the same relation to the vegetable economy, as condiments and seasonings do to the animal.

For the sake of explicitness, I shall prefer terming this latter class of Chaptal's, "amenders of the soil," and restricting the term "manure" to the former only; so that, according to their different definitions, as above stated, manure will include those matters, principally derived from the animal and vegetable kingdoms, which are capable of entering into the composition, and adding to the substance, of the vegetable; while the amenders of the soil will comprehend, on the other hand, those products, afforded chiefly by the mineral kingdom, not capable of being assimilated to the substance of the vegetable as manures, yet of use in the furtherance of vegetation,—thus including necessarily the consideration of a number of substances of very vast importance to the agriculturist.

Decandolle says, that every amelioration of the soil, such as draining, &c., is an amender, in the strict sense of the term; but here we limit it to such ameliorations which are practised on the soil only by the addition and mixture of matters, with the design of modifying its physical and mineralogical character, independent of any prominently nutritive effect. We must, nevertheless, bear in mind, that although this division of the subject will be extremely useful for the purposes of investigation, and, in a theoretical point of view, is strictly correct, yet, for all practical purposes, the relation in which manures and amenders stand with regard to each other must not be forgotten; for the greater part of manures have also a claim to the title of amenders, from containing, for example, certain earths, from different circumstances, and from influencing the density, temperature, moisture, &c., of the soil to which they may be added.

*Manures* are here defined as those substances capable of affording a salutary nourishment to vegetables in general, by presenting to them the necessary elements in a state of extreme division, either mechanical or chemical, which elements, through the agency of the vital processes of assimilation with which vegetables are endued, become a component part of the living plant.

In the former number of this magazine I pointed out, that vegetables were composed principally of

carbon combined with oxygen and hydrogen ; we therefore see the reason why dead vegetable matter, containing these principles, may become food to the living plant ; and when we moreover recollect, that animal matter often contains carbon, and always nitrogen, in addition to the oxygen and hydrogen, we see why animal, as well as vegetable matters, are entitled to be called manures, since both, as shown by experience are consumed in vegetation. It has been proved, as Sir H. Davy asserts, that they can only nourish the plant by affording solid matters capable of being dissolved by water, or gaseous substances capable of being absorbed by the fluids in the leaves of vegetables ; therefore the great object to be attained in the application of manure, should be to make it afford as much soluble matter as possible to the roots of the plant, and that in a slow and gradual manner, in order that it may be entirely consumed in forming the sap and organized parts of the plant.

Several experiments, which I have made, with the aid of poisons and coloring matter, prove that plants have the power of absorbing substances, when in a state of solution, unchanged in their chemical relations. The following experiment, from the Lectures on Agricultural Chemistry, and which I have repeated with a similar result, is sufficiently conclusive :—

“ The roots of a primrose were introduced into a weak solution of oxide of iron in vinegar, and suffered to remain till the leaves became yellow : the roots were then carefully washed in distilled water, bruised and boiled in a small quantity of the same fluid : the decoction of them passed through a filter, was examined by the test of infusion of nutgalls : the decoction gained a strong tint of purple, which proves that a solution of iron had been taken up by the vessels or pores in the roots.”

But it is found that the plant, in acquiring the elements of which it is composed, from these manures, does so, in many instances, through certain complex operations, and not always by the substance being merely placed in opposition ; thus, most probably, the carbon, of which plants are chiefly composed, is presented in the form of carbonic acid, and is then decomposed again by the vital power of the vegetable, in order to its proper assimilation. This view is suggested from the minuteness of the pores of plants, which renders it very improbable that the smallest particles of solids can pass into them from the soil. Davy, to prove this, made the following experiment : some impalpable powdered charcoal, procured by washing gunpowder, was placed in a phial containing pure water, in which a plant of peppermint was growing : the roots of the plant were pretty generally in contact with the charcoal. The experiment was made in the beginning of May, 1805. The growth of the plant was very vigorous during a fortnight, when it was taken out of the phial ; the roots were cut through in different parts, but no carbonaceous matter could be discovered in them, nor were the smallest fibrils blackened by charcoal, though this must have been the case had the charcoal been absorbed in a solid form. From this he infers, as no substance is more necessary to plants than carbonaceous matter, and as this cannot be introduced into the organs of plants except in a state of solution, or in the form of gas, that there is every reason to suppose that other substances less essential will be subject to the same law, when in a solid form.

We therefore see the reason why these aliments of the plant are rarely to be employed in their natural condition, but are left partially to ferment and putrify before they are used ; especially when it is

taken into consideration, that by permitting a partial decomposition to take place, the elements of which they are composed not only become more soluble, and therefore more available, when employed for agricultural purposes, but during the furtherance of these operations an additional advantage is derived from the production of many gases, such as the carbonic acid, carburetted hydrogen, azote, and ammonia, which in themselves may become aliments to the plants, or stimulants to its organs of assimilation ; though it must be allowed that the effects they are capable of producing must necessarily be small, for such parts as assume the gaseous form, in consequence of their facility of passing into the surrounding air, easily become mixed with the atmosphere and diffused through it.

I stated above what the elements were, which manures must have the power of yielding, and I also stated that animal and vegetable matters contained them : but it is necessary that a plant should submit to those changes, which it can only undergo after death, before it is in that condition which is essential to its having the power of yielding the required products ; nor is it less necessary, to the same effect that animal matters should likewise be deficient in all vitality : therefore we see it is proper that a partial decomposition should ensue, in order to afford as much soluble matter as possible to the roots of the plants required to be manured ; yet, this process must not be permitted to too great an extent, as in such case there would remain from the manure little else but fixed salts combined with such earths and juices as would be rejected by the plants, or, at any rate, its salutary effects would be much curtailed, yielding, perhaps, nourishment but to a single crop.

The means employed for retarding the process of decomposition are very various, but there is none more practically useful to the farmer than that of mixing the manure with the soil ; for by so doing, it is divided into small masses, which are not so quickly acted on as larger : thus by prolonging the phenomena that take place during decomposition, food is gradually afforded to the plant.

On the other hand, it is necessary that some manures should be exhausted by fermentation of somewhat of their power, when in their first condition they are found in their effects to be too strong and rank : of this description is the dung of certain animals, which, being the excrementitious matter of the food which is necessary to their nourishment, is, by the process it has already undergone, already more or less prepared for immediate use, depending on the force of the digestive organs, which varies somewhat in each species of animal, as well from the differences in their food, as from the quality of the digesting juices furnished by their stomachs. It is from these circumstances that the questions arise as to the relative value of manures, depending upon their composition, and the resisting power with which they are endued.

Many theories have been offered as to the mode in which manures operate ; of these, some are sufficiently fanciful, while others carry with them considerable weight :—the most conspicuous, both as regards their intrinsic merit, and from the high names of their authors, are those of Rozier, Senebier, and our countryman, Sir Humphry Davy.

Rozier, under the impression that nothing can be properly presented to the plants unless dissolved in water, and that the effect of manure is to increase the quantity of soluble matter in the soil to which it is added, argues that their action is to be compared to soaps ; but then he extends the meaning of this word far beyond its ordinary acceptation, for he not only

includes the different combinations of oils with alkalis, but all such modifications of matter as result from simple solutions.

Senecber holds the opinion, that they are rendered useful only through the process of fermentation which they undergo, under the impression that it is through its means alone that carbonic acid is developed; but he has not shown (which it was essential to have done) that all the carbon, which plants derive for their sustenance and growth from the media with which they are surrounded, is presented to them in that form, or, admitting such to be the case, that fermentation is the only means to this end.

Sir Humphry Davy at one time appears to have held much the same opinion, but subsequently attributed the mode of operation to a simple solution of those component parts necessary to vegetation. He says, that he introduced plants into solutions of jelly, sugar, mucilage, &c., but they died; while, after these various solutions had undergone fermentation, similar plants flourished in them, at which time he concluded that fermentation was necessary: but he says that he has since found that the deleterious effect was produced from the vegetable organs being clogged with solid matter, and from the prevention of a free transpiration in their leaves, in consequence of the solutions with which he experimented being too concentrated. The experiments, from which he deduces that his former opinion was erroneous, were made with similar solutions in the proportion 1-200th part of animal and vegetable matter. "Plants of mint," says he, "grew luxuriantly in all these solutions, but least so in that of the astringent matter. I watered some spots of grass in a garden with the different solutions separately, and a spot with common water, the grass watered with solutions of jelly, sugar, and mucilage, grew most vigorously! and that watered with the solution of the tanning principle grew better than that watered with common water." And then he goes on to show, from experiment, that there is every reason to suppose that soluble matters pass unaltered into the roots of plants.

Although each of these theories is sufficiently plausible, yet there is that known in opposition to each which permits one to say decidedly that neither is to be considered conclusive. Without entering into any general discussion as to their relative merits we may state, that by taking them all into consideration, by supposing, that now the phenomena are in accordance to the laws of one, and then in accordance of another, and by calling to our assistance the knowledge we possess of vegetable nutrition, we may, though not capable of defining a theory, be enabled to comprehend the various modes by which manures yield nourishment to the vegetable world.

We shall find, in the progress of this enquiry, that the different manures contain the elements necessary to vegetation in very different proportions, with which as well as with the relative strength of the *chemical* affinities they exert, both in respect of their own composition and the conditions to which they are subjected, it will be necessary we should make ourselves acquainted. The consideration of these subjects may be resolved into the three following divisions:—

1.—What is the gross amount of carbon contained in a given quantity of manure; in what state of combination does it exist; and in what mode is it presented to the plants?

2.—What other matters are contained, which from their nature may essentially be considered as manures, as nitrogen, oxygen, &c.?

3.—What other matters are contained, which can-

not be esteemed as manures, but as amenders or stimulants only?

The first of these queries involves by far the most important subject of enquiry to the farmer, and, fortunately, is not very difficult of investigation. The second and the third, though not so accessible to our researches, are by no means to be neglected in an inquiry of this nature; indeed, without a knowledge of them, the subject would be but imperfectly considered.

The more natural and convenient division of manures of organic origin, will be found to be into that of the vegetable, animal, and mixed.

**VEGETABLE MANURE.**—Under this title a vast number of substances are included, the agricultural properties of some of which will shortly be discussed. The whole of this class, for the most part, owe their importance to containing extractive matters,—albumen, mucilage, gelatine, sugar, oils, acids, salts, carbonic acid in aqueous solution, &c., which, however in their pure form, are seldom available to the farmer, as an application of manure, though they may be of great and prompt advantage to vegetation; nevertheless, they are all employed by him, combined, generally speaking, with a great excess of fibrous insoluble matter, which must undergo certain chemical changes before it can become the food of plants; for it is during the progress of the processes here alluded to that the decomposition ensues which causes the solubility of those particles, which in their former condition were insoluble. "Of those substances," says Chaptal, "which constitute animal and vegetable existence, the greatest number are soluble in water, and it is evident that in this state we may employ them as manures without previous fermentation; but when they contain much matter insoluble in water, it is necessary they should be decomposed by fermentation, since by its means their nature is changed, and new compounds are formed, which are soluble, and capable of being taken up by the plant."

The progress of the changes which are thus effected have been particularly detailed in the Lectures on Agricultural Chemistry; together with that great author's opinion on the propriety of taking "a scientific view of the nature of these changes,—of the causes which occasion them, and which accelerate or retard them,—and of the products they afford." The products of fermentation are very various, depending on the nature of the substances of which the vegetable mass is composed, influenced greatly by many accidental causes. The diversity and almost uncertainty of the products have rendered observations on its progress very difficult;—we may, however, say, that the result of the spontaneous reaction of the matters composing the mass on themselves, in consequence of humidity, is, that carbonic acid gas, acetic acid, carburetted hydrogen, &c., are evolved, leaving eventually a brownish blackish mass, which is termed "terreau" by the French, and earthy matter, or vegetable mould, by ourselves. To this effect, Sir H. Davy, from experiment, proves, that "if any fresh vegetable matter, which contains sugar, mucilage, starch, or other of the vegetable compounds soluble in water, be moistened and exposed to the air, at a temperature from 55° to 80°, oxygen will soon be absorbed, and carbonic acid formed; heat will be produced; and elastic fluids, principally carbonic acid, gaseous oxide of carbon, and hydro-carbonate, will be evolved; a dark-coloured liquid, of a slightly sour or bitter taste, will likewise be found; and if the process be suffered to continue for a time sufficiently long, nothing solid will remain except earthy and saline matter, coloured black by charcoal." The dark-coloured fluid always contains acetic acid. So

that the general division of the products of this putrefactive fermentation may be stated as into liquid, gasous, and solid.

The liquid are chiefly water and acetic acid, and with, probably, a little oil. The gaseous are the carburetted hydrogen, carbonic acid, and, when nitrogen is present, ammonia. The solid are those matters which are contained in that residuum termed vegetable mould.

The prominate principles, which depend on the arrangement of the elements, are not equally liable to undergo this species of dissolution: as a general law it may be stated, that those which contain hydrogen and oxygen in the proportions to form water, are the most susceptible of the putrefactive changes; whilst acids which contain an excess of oxygen, and those substances in which charcoal and hydrogen prevail, do not manifest a similar tendency, unless, through the mediation of heat and moisture, their affinities be estranged. Thus, "in proportion as there is more gluten, albumen, or matters soluble in water, in the vegetable substances exposed to fermentation, so in proportion, all other substances being equal, will the process be more rapid. Pure woody fibre alone undergoes a change very slowly; but its texture is broken down, and it is easily resolved into new elements when mixed with substances more liable to change, in consequence of containing a larger proportion of oxygen and hydrogen. Volatile and fixed oils, resins, and wax, are more susceptible of change than woody fibre, when exposed to air and water, but much less liable than the other vegetable compounds."<sup>78</sup>

We see, therefore, that it is necessary, in order to appreciate the probable action of the many manures generally in use, to analyse them carefully, so that we may be enabled to consider what the ingredients are of which they are composed; but this must not be the end of our investigations, as other considerations of importance are not to be overlooked. In proof, we adduce the following:—Carbon, as repeatedly observed, holds the first rank as a manure: the matter which is the most rich in carbon is the charcoal of wood, which, were we to take the relative quantity only into consideration, we should be induced to believe to be the best of manures; yet we really find that it can scarcely be ranked amongst them, for the carbon, when it is in this condition, is but slightly induced to form carbonic acid, and is not susceptible of forming a solution capable of being absorbed by the roots.

The other circumstances, to which attention is principally to be paid, are,—the elevation of temperature which may be caused either by the rapidity or degree of fermentation; the quantity of water which the plants contain; the presence of such nutritive matters as are unequally soluble, thus permitting a prolonged action; and the presence of such matters as are not of a nutrient quality, but merely excitants.

We shall now proceed to the consideration of the more important manures in ordinary use, and to which the above observations are applicable.

**GREEN CROPS.**—The most usually employed are the green succulent plants, as trefoil, lucerne, beans, &c. These are principally composed of woody fibre, combined with mucilaginous and saccharine matters, which, from containing the elements they are composed of in such proportions as are easily convertible into water, especially as their affinities are so weak as easily to undergo the putrefactive fermentation, aided, as this process is, by the large proportion of

fluids they contain, the woody fibre, which in its simple state, from containing a much larger proportion of carbon than oxygen and hydrogen, is not very susceptible of putrefaction, by being submitted with the other portions of the plant to this action, has its carbon converted into carbonic acid, reducing thus the oxygen and hydrogen to proportions convertible into water;—thus the whole becomes soluble.

As these processes take place very easily, it is necessary to use them immediately they are cut down, or the usual and best plan is, to plough them into the ground, at once, on which they were growing; but care must be taken that they are not sunk too deep in the soil, as in such case, from being deprived of heat and air, their benefit will be but very slowly developed; at the same time, they must be ploughed in sufficiently to enable the woody fibre to be dissolved, and to prevent the fermentation going on too rapidly, that the nutrient elements may not be dissipated through the air.

The best time for ploughing in these green crops is during the summer, before the plants have scattered their seed, and when their leaves are full of fluid, and there is heat of sun sufficient to hasten the destruction of their natural condition.

It is the opinion of a practical writer, that where crops of green plants can be turned down, when the season is sufficiently hot to ensure their speedy running into the putrid state, there cannot be any doubt but that it is a better and more advantageous practice, especially where manures of other kinds are scarce, than that of procuring it by the consuming of such crops by the feeding or soiling of cattle.

Of a similar nature, both as to chemical composition and practical use, is the *river weed*; it contains a large quantity of mucilaginous and saccharine matters, with, perhaps, less of woody fibre than the succulent land plants.

From the very large proportion of water which it contains, it is necessary to heap it for a week or so (ten days at the furthest), to permit the superabundant quantity to drain from it: it may then either be ploughed in, or mixed with a little lime and earth to form a compost. From this large proportion of fluid, and from the easy solution of its component parts, it is necessary to use it as early as possible; for a very short time is necessary, under favourable circumstances, to hasten the completion of the process of fermentation, in which case its application as a manure would be useless.

In the neighbourhood of the sea coasts there is not a more available manure than the *sea weed*; the fuci, algae, and confervæ, are indiscriminately used: though unequal in their composition, they each abound with mucilage and salts, which for the most part are the muriate and carbonate of soda, and analysis has shewn that they also possess much carbonic acid. As sea weed does not contain fibrous matter, there is no necessity for permitting it to ferment before ploughed in: from the same cause, also, together with the quantity of water formed by its decomposition, the effect produced on the land is but very transient. So rapid, indeed, is this process, that it is found the cast-up weed is not nearly so valuable as that cut from the rocks. Those soils which are manured by it must be annually supplied with large quantities.

In the islands of Guernsey and Jersey it is used in the spring in its natural state, immediately after cutting it from the rocks, when it is found of great service in pasture lands; later in the year, however, they dry the weed, and, from scarcity of fuel, burn it, and use the ashes only as a dressing; but the loss, in an agricultural point of view, is very great,—in

\* Davy's Agricultural Chemistry.

fact, it is little more than strewing the ground with sea salt.

The value of this manure in improving old pastures is very great, and where it has been tried, it is remarkable with what avidity sheep and cattle eat the grass, and how well they thrive and fatten on it.

(To be continued.)

## PARING AND BURNING.

[We by no means coincide in all the statements contained in this article; we, however, postpone our remarks for the present, in the hope that some *practical* farmer may be induced to comment upon them in our next publication.—Ed. F. M.]

This is a subject which has occupied the attention of agriculturists for ages, and still remains polemical; yet how few individual writers step forward to extricate us from the labyrinth in which we are heedlessly wandering. And shall we, while the mechanical world is making such rapid strides toward the zenith of perfection, remain dormant and listless? No! Let every one dedicate his talent however diminutive, to the public weal, and then we shall see the agriculturists not passing along the same paths which their fore-fathers trod, but soaring as it were, into other climes, catching the living manners as they rise, see all efforts combined for the public good, and the combined efforts concentrating in individual happiness. Still, my feeble efforts to elucidate the subject may be ineffectual; but if I do but advance one single step more towards the point of perfection, I shall consider myself sufficiently remunerated. Not, that I wish to attribute the least ignorance to the enlightened agriculturists of this kingdom; far from it. I respect them, and shall always feel it my duty to contribute their general welfare.

One class of farmers supports the system of paring and burning, while another as strenuously opposes it. Now which of the contending parties is steering the most judicious course, remains yet undecided. It is generally acknowledged, that by burning, the soil is very much reduced. The vegetable matter, by being calcined, instead of gradually undergoing the process of putrefactive fermentation, is immediately brought into active exercise, and at once appears to afford an ample remuneration to the farmer. As it generally occurs, that paring and burning is found most serviceable on cold, low, wet lands and the most tenacious soils, that being the quality of land which naturally produces nothing but aquatic plants and coarse grasses, injurious to animal existence, it has, therefore, been thought the most effective method of bringing the land into an immediate state of cultivation, without once taking into consideration the great loss of soil which must necessarily occur from the combustion of so great a mass of vegetable matter. Consider the great mass of vegetable matter you have on the surface, and which by putrescence, would furnish you with a fine rich compost for two moderate dressings; but by being calcined loses all its vegetable properties, and is nothing more than torrifed earth; all its vegetable properties having passed off during the combustion; for,—

The heat which from combustion springs,  
Gives to matter it's eccentric wings.

How many are there of the new compounds formed

during the combustion carried off by Heaven's winds, to other lands.

Another prevailing cause why paring and burning has been so much sanctioned is, because the farmer has generally had most exuberant crops for two or three years after it; but what has been the effect after those crops have been taken? We generally find the same lands, which but a few years before, presented the most imposing appearance, afterwards presenting as barren an appearance. One great advantage that arises from burning is this:—the calcined earth, by being incorporated with the raw, tenacious soil, keeps open its pores, thus acts as a common percolator, by allowing the water to pass freely from the surface, which, if retained, would be injurious to vegetation; thus accounting for the benefit which arises from burning for two or three years, but as to the real, or permanent utility, I very much doubt; for I have invariably found lands which have been subjected to paring and burning, ultimately very much deteriorated, which must necessarily occur from the destruction on the loss of so much vegetable matter.

But, as doctors differ, so do farmers: I will, therefore endeavour, as concisely as possible, to lay down a plan which I have pursued, as I have not met with the work of any agricultural writer who has written upon it. My plan is paring, *without burning*; but, allowing the vegetable matter to gradually undergo the putrefactive fermentation, and I think it far preferable to paring *with burning*, as there is no loss of vegetable matter.

In the year —, I pared and burned a field; the summer proving very unfavorable, I found great difficulty in getting the turf into a fit state to burn after frequent repetition of turning and rearing the sods, became so broken as to prevent the entire collecting of them from oil the surface. One part of the sods were burnt, and the other remained scattered about the surface, in small pieces. The ashes from the part of the sods which were burnt were spread, and the ground ploughed. During the ploughing, the greatest difficulty was found in turning over the furrow, from the loose turf which lay scattered over the surface, causing it continually to rear. After the ploughing the land was sown with wheat, and in return for the immense labour I received an extremely poor crop. The year following I ploughed another field, adjoining the former, and about in the same condition, in regard to the turf and quality of the land; this field was ploughed down without paring; the turf in this instance, resisted the pressure of the plough, and wherever there was an abundance of it, the furrow reared very much. This field was sown with oats, and in return, I received a very bad crop.

As necessity is the mother of invention, from having two crops which were failures, I determined to try some other plan, and on the year following, I adopted the method which I am about to state, in a field adjoining the two former one's, and as nearly allied to them as possible, as regarded the quantity of turf and quality of the land. I had the field pared, and the whole of the sods carted off, and heaped up to the height of about four feet, in a convenient place in the field. I then had ten quarters of lime per acre, spread upon it, and the field ploughed down immediately after spreading the lime. The same Michaelmas the field was sown with wheat, and I never had, to my recollection, a more abundant crop. The next year I put in a leguminous crop, and the year fol-

lowing, a calmiferous one. In the winter succeeding to the last mentioned crop, I had the field spread over with one half of the compost formed by the decomposed turf, and then ploughed in; the summer following I followed the same field, and did not give it any manure, excepting the compost which had been spread on in the winter. I had the fallow sown with turnips, and had a remarkable good crop; the next spring it was sown with oats, and seeded; the crop of oats was excellent,—yielding seven quarters per acre. The following winter I put on the remaining part of the compost, and the seed crop, I may say, was super-excellent.

Now the two first mentioned fields required following after the first crop was taken. The field which was pared and burned might have sufficiently remunerated me, had the season proved favorable, but then it is quite impossible for us to prognosticate the state of the weather during the course of a summer. Again: by paring and burning, you are obliged to commence the process in the early part of the summer,—thus, losing your summer's grass: besides, from the combustion, you have a great loss of soil; many of the component parts of the vegetable matter being resolved into their primary elements, again combine, assume new forms, and are carried away by the atmospheric air; whereas, by paring and removing, you may delay the process until the latter part of the summer; thus taking the benefit of the summer's grass. You have no hazard to run in regard to the season, no loss of soil from combustion; but you gain a rich compost from the decomposed turf, sufficient for two dressings. And if we make a moderate calculation upon the two systems we shall find the latter less expensive than the former.

Supposing we make the following computation:—

FIRST METHOD.	
Paring and burning..	24s per acre.
Spreading .....	2s ditto.
—	
Total ..	26s
SECOND METHOD.	
Paring .....	14s per acre.
Leading and heaping..	8s ditto.
—	
Totals ...	22

Thus we see how far one system exceeds the other in expense. But as regards the ultimate benefit to be derived from them, I leave that to the practical agriculturist to determine, and merely state what I have done.

*(To be continued.)*

*South Normanton, Alfreton, S. P. G.*  
*Derbyshire.*

A CURIOUS RAM.—Mr. Foster, butcher, of High-street, Doncaster, has in his possession a ram, which is considered a wonder by all who have seen it. The size of the horns, and the strength of the animal, are equally surprising. The animal is five years old, a mixture of the Spanish and Norfolk breed, and has been in Mr. Foster's possession a considerable time. The length of each horn is rather more than four feet, and the circumference at the roots, twelve inches. It will carry Mr. Foster's eldest son, about seven years old, on its back, with the greatest ease and safety. Lord Hawke, and several noblemen and gentlemen, have viewed the animal with astonishment, and many overtures have been made for a purchase, as neither the Zoological gardens in London and Liverpool have so fine a specimen.

## SELECT COMMITTEE ON AGRICULTURE.—HOUSE OF LORDS.

(AS AMENDED 4TH JULY, 1836.)

[The subjoined report was proposed, but not agreed to.]

The Select Committee of the House of Lords appointed to inquire into the State of Agriculture, and into the causes and extent of the distress which still presses upon some important branches of Agriculture, and to report their observations and opinions thereupon to the House, have, in pursuance of the Order of the House, considered the matters referred to them, and agreed to the following report:—

It is the duty of the Committee to state to the House, that, from the evidence of witnesses of various classes, and collected indiscriminately from all parts of the country, there can be no doubt that a great and generally prevailing distress has affected, and, except mitigated by circumstances of a questionable character both in respect of real relief and of probable duration, still continues to affect, the Agriculture of this kingdom.

They are most anxious in no degree to overstate the case into which they are directed to inquire; but it appears that, looking to facts generally, and with those exceptions only which great accumulation of property in a few individuals, or the peculiarly favourable condition of certain descriptions of land, partially present, the general condition of what is called the landed interest may be stated to be this:—

The owner of soil is labouring under fixed charges, with greatly diminished rents:

The occupier is contending with reduced prices of produce, while the wages of labour, the cost of implements of husbandry, and most of the costs of production are in comparison but slightly diminished:

And the yeomanry, uniting the character of the two and sharing in the distress of both, are suffering in a still greater proportion in the general depression which prevails.

It is impossible also to overlook this peculiar feature of the case, that though in various alternations of peace and war, of scarcity and abundance, which the history of the country presents, its different interests have at times been subject to all the varieties of prosperity and depression, it would be difficult to find any period when, for twenty successive years, with one short intermission only, one particular interest has been borne down with continued and seemingly increasing pressure, till it has arrived at that state in which an inquiry into its condition had been matter of recommendation from the Throne, and has of necessity been entered into by both Houses of Parliament.

The Committee would have had a pleasure if, in turning their eyes from the situation of the proprietor and occupier of the soil to that of the labourer drawing his subsistence from it, they could see reason to indulge the hope, that that which is described as the comfortable condition of the latter were one which could in its nature be permanent.

All the witnesses are agreed that the wages of labour are higher than the farmer can afford; it required no evidence to prove this; for it appears that wages in England are not reduced more than perhaps 1s in 8s or 9s, while the prices of produce to the farmer cannot be reduced less than from thirty to fifty per cent.

Mr. Cayley, in his evidence, has well observed, that there cannot be a more alarming state of things than that of a labourer thriving at the expense of his employer.

To questions put, "How the farmer continued to pay wages incompatible with his profits?" the answer has generally been, "That he did not know how to reduce them."

But it is evident that this is a state of things which cannot continue. Sooner or later, and probably at no distant period, when rents have been further reduced, (and there is reason to think that this has already taken place to an extent highly detrimental to the classes de-

pendent on the agricultural interest for custom or employment;) the next step must be a general reduction in the wages of labour. To that point, except the prices of produce be rendered more commensurate with the cost of production, we must speedily come.

Should this be coupled with any diminished means of obtaining the necessaries of life, from deficiency of produce arising from bad seasons, such as have already raised the price in some articles of produce to the injury of the consumer, but as it is stated with no adequate remuneration to the farmer, it would be impossible to maintain the exclusion of Foreign grain, and thus the means of the farmer to give employment would be further reduced.

The Committee submit that it is impossible to contemplate a state of things not only possible, but to which the situation of the country rapidly tends, without the deepest apprehension.

The Committee have proceeded first to ascertain whether the depression of the price of wheat, that article of produce in which the depression of price greatly exceeds that which is distinguishable in any other article of agricultural produce, can be attributable to an increase of the growth or a decrease of the consumption, or to both.

Upon this subject they feel it difficult to declare a positive opinion.

Many of the witnesses have deposed to a greatly increased breadth of corn sown: on the other hand it is questionable whether the exhaustion of lands over cropped, and, from the same poverty of the tenants which led to over-cropping, ill-manured, has not reduced in a great degree the general amount of produce.

There can be no doubt, however, that, going back to a period before the war, an immense increase of corn has taken place. It must have been so to have maintained with so little addition of Foreign importation such a vast increase of population; but then, on the other hand, the effects of this increase of population must be taken into account, and in what degree the one balances the other it would be difficult to decide.

They would wish, however, to call the attention of the House to some facts belonging to the case.

The great increase of inclosure acts and presumed increase of agricultural produce took place between 1798 and 1813, during which time the population, though progressing, showed by no means the same amount of increase as at the present time.

During this period prices were continually rising.

From 1813, or rather from 1815, down to the present time, though it may be doubted whether any considerable increase has taken place in the quantity of corn produced,—and during which time, on the contrary, the population has been increasing at a rate of upwards of 200,000 souls in the year, prices have been continually falling.

When, therefore, we see that the greater amount of corn, seconded, as we have shown it in the first period, by a comparatively smaller increase of population, was yet unaccompanied by any visible diminution of price; and that, in the second period a less amount of corn, counteracted by a great increase of population, has failed to arrest the tendency of prices to fall, we must be led to the conclusion that this is not the cause of the depression of prices at the present time.

Those of the witnesses who appear to have had the best opportunities of observation, and who have made it their study to investigate most attentively and accurately the particular circumstances of the agricultural interest, having watched the fluctuations in the prices of the various articles of agricultural produce, and the causes in operation when such fluctuations occurred, and to which they were referable, have concurred in the opinion that the low range of prices of agricultural produce which has prevailed generally for the last fifteen or sixteen years, and which is the cause of the existing distress, has been occasioned by the contraction of the circulating medium consequent upon the operation of those measures of the legislature which enacted the resumption of cash payments by the Bank of England, and the restoration of payments in gold.

The witnesses have supported that opinion by reference to the actual variations which have taken place in prices following, and consequent on corresponding fluctuations in the state of the circulating medium: and they have shown that although particular causes affecting temporarily the supply or the demand for particular articles may for a time have raised such articles above, or depressed them below, the price which they would have borne if they had not been acted upon by such causes; and although there has occasionally been a discrepancy between the prices of such articles and the amount of the circulating medium, by which prices generally are alleged to be regulated, yet it has been proved that, when such a discrepancy has existed, there has always been a disturbing cause sufficient to account for it, and that the general range of prices has, in the long run, been governed by the amount and state of the circulating medium.

Upon the subject of these disturbing causes, by which the marketable value of different articles has been at different times affected, the committee refer to the evidence for some interesting and valuable information.

The prices of barley and oats have in some years been kept above their proportionable price in consequence of a deficient harvest.

In 1831 the price of wheat was raised to 70s from a similar cause.

The general prevalence of rot among the sheep, by which one-fourth of the flocks of the kingdom are stated to have been destroyed in the wet season of 1831 and the preceding years, produced a scarcity of mutton and of wool, and occasioned them to bear a higher price, and also caused a rise in the price of beef.

These cases do not at all disturb the general rule that the quantity of money must determine the general price of commodities, nor do they affect the proof which has been given that the depression of prices from which the agricultural interest has suffered has been occasioned by the operations on the monetary system to which the witnesses have referred.

This was the conclusion arrived at by the Committee of the House of Commons which was appointed in 1821 to inquire into the causes of the agricultural distress existing at that period, immediately subsequent to the coming into operation of the bill of 1819, which established the present monetary system.

That Committee reported, "That they cannot but ascribe a proportion of the depression of price, which now generally prevails in other countries as well as this, to the measures which the restoration of our currency has rendered necessary, the general effect of which has been in some degree to derange the markets of every part of the civilized world."

The report of the Committee of 1833 confirms also this view, and the table of the prices of corn, contained in the Appendix, shows that the effects of the measures of 1819 began to be felt immediately on their coming into operation, and that they have not yet ceased.

It has been argued, in opposition to these views, that if the depressed state of Agriculture is attributable to this cause, the trade, commerce, and manufactures of the country could not have been exempt from its operation; and these it is alleged are now flourishing.

The Committee do not consider it within their province to carry their inquiries into an examination of the actual condition of the trading and manufacturing interests, how far they have been or have not been affected by the same causes as the agricultural interest, or, if exempted from the influence of these causes, to what their exemption is to be attributed; or into their alleged prosperity, the time which it has endured, or the probability of its permanence. They will observe, however, that a general depression of price of all commodities did not take place contemporaneously with the measure of 1819.

It is unquestionably also the case that the system under which the agriculture of the country is necessarily carried on, renders those who are engaged in it more liable to be permanently affected by any fluctuation in prices, than those whose capital is employed in trade. The rent of the farmer, his taxes, his wages, remain for a long period unaltered, whatever may be the

fall in prices; and his capital is invested in a shape in which he cannot dispose of it in anticipation of a change in times. The operations of the merchants and manufacturers, on the contrary, have much less reference to preceding events: their prosperity does not depend upon any comparison between present receipts and engagements of ancient date, but is generally regulated by the simple principle of supply and demand, uninfluenced, or influenced in a much less degree, by any of the results, which, in a great fluctuation of price, have been shown so materially to affect the condition of the agricultural class.

The Committee now come to the consideration of what modes of relief may be applicable to the present or prospective condition of the interest, whose situation has been the subject of the present inquiry.

In approaching this question they find their difficulties much enhanced by the consideration that some of those causes, which have been referred to in the preceding part of this report, and which, in the opinion of many, are considered to be the most influential causes affecting this question, are precisely those with which Parliament has declared a reluctance to deal.

There is a subject, however, akin to this part of the question, on which, though in opposition to the opinion of the Governor of the Bank of England, to whose evidence in support of his opinion they refer, they are nevertheless inclined to offer their recommendation. They allude to the restoration of the silver standard.

In the report of 1819 it is stated, that the object proposed was to restore the ancient metallic circulation and standard.

The ancient standard was formed equally of silver and gold, and it was in the option of all debtors to discharge their obligations in either coin.

The bill of 1819 (the 59 Geo. 3, c. 49,) professes by its title to continue the restrictions, contained in the several enumerated acts on payments in cash by the Bank of England, and to provide for the gradual resumption of such payments.

The meaning of these words is that the payment of all debts was to be made in the same coins in which they might legally be made at the time when the first of the acts recited in the preamble of that statute passed; this was the construction put on these words in both Houses of Parliament.

It was said that this law was made to retore the ancient standard of value: now the ancient standard was a joint standard of gold and silver, and that standard was continued as the lawful standard until the year 1816, which was long after the passing of the recited acts.

The 14 Geo. 3, c. 42, in consequence of the state of our silver coin at the time, limited the tender of it by tale to payments to the amount of 25*l*, but allowed it to be a tender by weight to any amount.

The 56 Geo. 3, c. 111, which declare in section 11 that gold and silver have been at various times tenders for payments to any amount, was the first law that altered the standard of value, by enacting that silver should no longer be considered a legal tender for more than debts of 40*s*. Whilst cash payments were suspended the change made by this bill was not felt; the 52 Geo. 3, first brought the 56 Geo. 3, into force, and made the country sensible of the great contraction of the currency which that act had occasioned.

It appears that at the times when the two above-mentioned acts (the 56th and the 59th Geo. 3.) received the sanction of the legislature, gold, which by these acts became for the first time the sole legal tender and measure of property, had advanced in price as estimated against silver, and had become the dearest of the two metals, both in this country and throughout Europe; these acts therefore abolish the old, the easier, and the lower standard, and substitute in its place a new, a higher, and more contracted standard; and, to the extent of the difference between the value of these two standards, effected a reduction in the money prices of all property and commodities below the level which the old standard would have sustained; and in an equal degree increased the weight and virtual amount of all existing debts, contracts, and taxes.

Since the period of the passing of these two acts it appears that standard silver has borne a price in the market, as estimated in gold, of from 4*s* 9*d* to 5*s* 2*d* the ounce. An ounce of standard silver was, according to the law bearing date 1601, and which continued in force to 1816, coined into 5*s* 2*d* of money; which money so coined, during this whole period, was a legal tender in this realm, a standard of value, and measure of property: taking the average market price of standard silver for the period which has elapsed since 1819 at 4*s* 11*d* the ounce, this gives a difference of 3*d* the ounce, or about five per cent. between the market price and the old mint price of silver during this period.

It is therefore to this extent, viz. to the extent of five per cent., that the act of 1816 substituted a higher standard for the ancient legal standard of the realm.

The prices of agricultural productions, and of all other property and commodities, have thus been reduced five per cent. below their just level; whilst all taxes, debts, and contracts have been wrongfully increased to a like extent.

It does not appear that the legislature, in adopting this important measure, took into its consideration the weighty interests concerned; or contemplated a change which would have the effect of lowering the prices of commodities, and of increasing the amount of debts and taxes.

Considerations of justice, as well as of policy and necessity, seem now to require the re-establishment of the ancient standard of value of the kingdom, by the restoring silver coins as a legal tender conjointly with gold coins, such silver coins being in the proportion of one ounce of standard silver to 5*s* 2*d* of money.

The Committee are aware that in thus proposing to return to the ancient standard, such as it has always existed up to the year 1816, they are recommending that which cannot properly be described as a measure of agricultural relief; but they conceive that, by at once widening and rendering safer the basis on which all monetary transactions rest, they will afford greater facilities to agricultural as well as to commercial concerns, and benefit the farmer in two ways in which he is susceptible of being benefited; viz., by the means which it affords of increased accommodation, and by the creation of new speculators in the market in which he deals.

The next head of inquiry to which your Committee propose to advert is the importations from Ireland.

Between the years 1814 and 1836 the importations of Irish wheat have increased from 159,138 quarters to 340,565 quarters, and wheat flour from 180,375 cwt to 1,124,343 cwt., barley from 29,108 quarters to 156,542 quarters, and barley meal from 5 cwt. to 248 cwt. Oats from 576,544 quarters to 1,462,580 quarters, and oatmeal from 32,988 cwt. to 556,006 cwt.

The importation of other articles of agricultural produce has also increased in a large proportion.

The improved communication also by railroads and steam navigation has much facilitated the transport of live and fresh meat, and all other articles, so as to produce a more constant and far wider impression on the English market.

It may, however, be doubted, whether the increase of importation may not have been more than counterbalanced by the rapid increase of population in England within the same period. It appears, likewise, that the importation of wheat and wheat flour from Ireland has diminished annually to the extent of about 200,000 quarters within the last two or three years contemporaneously with a great fall of its prices.

If the import of Irish produce have the effect, which it must necessarily have, of depressing the English market, the legitimate mode of alleviating such a state of things would appear to your Committee to be a system of legislation that might tend to raise the physical condition of the Irish population to the extent that would enable them to consume a larger proportion of the produce which they raise, and also eventually empower them to bear a more equal share of the general taxation of the empire.

One step in this course of prospective improvement,

according to the opinion of your Committee, might be a well-considered plan of poor laws for Ireland.

With respect to other modes of relief than those alluded to, every species of taxation pressing upon agricultural production must have reference to it, and every remission of such taxation must tend, directly or indirectly, to its relief; yet the great reduction of general taxation that has taken place on agriculture since the peace, without a corresponding diminution of the pressure upon that interest, shows clearly that the reduction has fallen far short of the actual necessities of the landed interest.

One cause of this, undoubtedly, is the rise of the value of money, which has lowered the price of the produce to a greater extent than the taxation has been reduced. It cannot, however, be argued from this that the reduction in taxation has been no relief, because, if the taxes which have been reduced since the peace were to be re-imposed, there would be physical impossibility to enforce the payment of them. At the same time it appears equally evident that a reduction of the general taxation sufficient to meet the depression in our agriculture is incompatible with our obligations to the national creditor.

Still the Committee are inclined to the opinion that some modification of the taxation might be made which would operate beneficially on the land,—for instance, if any substitute could be found for the malt tax it would doubtless stimulate the demand for and the growth of barley, and likewise tend to improve the price of wheat. Whether such substitute could be found in an equalization of the land tax (the inequalities of which are shown in the Appendix), which seems to have been almost entirely evaded by all other descriptions of property, although originally designed to fall on all, personal as well as real, or whether the beer duty may not on the whole (whether financially or morally considered) be a better tax on barley (if it be required) than malt, we leave to the more mature consideration of the House, satisfied that the repeal of this tax, in many points of view, would be a great boon both to the farmer and the labourer, as well as to the morality of the country at large, provided it can be done consistently with the national credit.

The Committee have also heard evidence which favours the proposition that a remission of the duty on soap might be effected by substituting for it the imposition of a higher duty on foreign tallow; the effect of which would be to benefit the working class in their consumption of the necessary article of soap, to give encouragement to the feeders of stock, and a higher price to that part of the carcass which of late years has lost so much of its comparative value.

Another question which, from the importance attached to it by many of the agricultural class, has a claim on the attention of your Committee, is the warehousing of foreign corn.

Those who uphold the present system contend that, from the proximity of ports opposite to the English coast, the only practical result of disallowing the warehousing of foreign corn in this country would be to transfer to foreigners the profits of the transaction now enjoyed by the English; and further, that in case of a general scarcity it might not be safe to discourage the warehousing of the produce of the continent on our own shores.

It is alleged, on the other hand, that the warehousing system takes from the English grower much of the protection intended for him by the corn law of 1823.

It appears from the returns in the Appendix, that from the year 1814 to that of 1836, there have been only seven years (three of them, 1833, 1834, and 1835,) in which the holders of warehoused foreign corn might not enter it for home consumption at a duty of 1*l* 1*s* 8*d* per quarter—a duty considerably lower than that which the average price of wheat during any continued period would give; this is an advantage which would not be obtained by any one not having his corn at hand to watch the turn of the market; and the result has been that the corn merchant, being able to buy foreign wheat at perhaps half the price at which it can be profitably grown in this country, and having the same fa-

cility of bringing it to market which he would have with English wheat, is led to speculate exclusively in foreign produce, to the detriment of the English grower, whose surplus produce might otherwise be accumulated in our warehouses, as is the case with foreign corn, relieving the market at periods of over-abundance, and at the same time ready to be brought again into the market to the relief of the consumer in a season of deficient supply.

The Committee, notwithstanding, would be unwilling, without the fullest inquiry, to offer any opinion favourable to the alteration of the existing system; but they may be permitted to throw out the following considerations.

In the first place, the great importations from Ireland have materially altered the situation of this country in respect to foreign supply.

It is to be considered also that an embargo on corn warehoused abroad could hardly take place so suddenly or generally, but that in a country like this, abounding in population and manufactures, the gradual demand for and progressive rise of price would necessarily bring to our markets the surplus produce of foreign countries, long before the exigencies of any particular state, or the policy, from any cause, of its government, suggested the prohibition of exportation.

The duty in 1801, imposed by Prussia, during a particular period of scarcity, being a duty imposed on exportation, suggests no argument as to the preferableness of warehousing at home or abroad, but only leads to the general conclusion, that it is advantageous to render ourselves, as far as may be, independent of foreign supply.

Supposing this question, by much the more difficult one disposed of, which the Committee are far from asserting, the other argument, viz., the profitable employment of capital which the present system affords to certain individuals engaged in the warehousing trade, is of much more easy solution.

It cannot be seriously urged that the interests of a small, and comparatively unimportant class, can be weighed in the balance against the claim of the agricultural interests of this country to enjoy unimpaired that protection which the State has guaranteed to them, and which, by promoting a large and steady supply of corn of home growth, may be necessary to ensure its independence of foreign nations in the great article of food.

Other suggestions were made in the course of the evidence, of minor importance, for which the Committee would refer to the evidence itself; and as matters of detail they appear well worthy of consideration.

In a great question of this kind it has appeared to their judgment preferable to put the more important features of the subject the most prominently forward. The evils which have befallen the agricultural interest must be deeply seated, and beyond mere natural causes, or they would not have been so lasting and general in their pressure; and if, during the sitting of the Committee, some improvement of prices has taken place, tending to raise (as is always too easily the case) the hopes of the agriculturists that the depression had reached its lowest point, and that the season of former prosperity was about to revive, the very facts to which this improvement must be ascribed are unfortunately those which it is to be feared cannot be depended on for permanence, and in their beneficial effect are calculated to produce only imperfect and partial results.

To take this latter point first: the high price of mutton and beef, there can be no doubt, is in great part owing to the general failure of the turnip crop in the last year, and the great deficiency of food during a winter unusually prolonged, so that the stock was not only diminished in quantity, but greatly reduced in fitness and weight.

The great destruction of lambs also by the severity of the spring is not a matter of doubt. Can it be said that the farmers, as a body, can be benefited by the loss of one-half or one-third of their stock?

It is notorious also that the London butcher, though charging 1*d* to 2*d* per pound more for his meat, finds his profits less than in cheaper years; so that all, as is

necessarily the case, are losers instead of gainers by high prices, the result of scarcity.

Another cause to which the late advance of prices has generally been referred, is the extension of joint-stock banks, which by stimulating trade and increasing consumption, the usual effect of an enlarged circulation, has benefited the agricultural in common, though not in the same degree, with the other industrious classes, and chiefly in those districts where such banks have been established.

It is obvious, however, while these results seem to point out the mode in which agricultural prosperity may be made to revive, that of all modes in which an enlarged circulation can be productive of such an effect, the transactions of the Joint-Stock Banks have been those from which the agricultural interest has derived the smallest benefit, in proportion to the risk of improvident issues which it shares in common with the other productive classes.

Large however as have been the speculations which have stimulated or been based on the issues of the Banks in question, it is not contended that there is any thing fictitious or inconsistent with legitimate trade in the great extension of manufacturing and mercantile operations which has recently taken place.

And if, as those most conversant with the subject, do not hesitate to predict, in consequence of the usual effect of a greatly increased circulation, the prices of all commodities should rise, till gold, becoming the cheapest article of export, the result shall be a necessary contraction of its issues by the Bank of England, and possibly a recurrence in some degree of that which took place in 1825; not only the prospects of the agriculturists, as far as they are connected with the foregoing causes, will fall to the ground; but it will also appear as if there were something in the present monetary system of this country which is inconsistent with the due development of its active industry and with the employment of its capital and resources to the extent which the means of the country would warrant, and which the wants of its population would seem to demand.

On all these grounds, encouraged rather than checked by passing events, the Committee cannot hesitate to urge upon the House the deliberate but serious consideration of the real state of the agricultural interest, such as it has been, such as it unquestionably remains at the present time, and such as a reasonable view of existing causes would determine to be its future prospects.

It appears to them, from the magnitude of the interests involved, and the feelings which have been developed, that even if it were just it would not be practicable to shut our eyes to its condition. It is the largest interest in the state, comprising, with its dependencies, according to some calculations given in the evidence, not less than five-sixths, according to others more than half, but at all events constituting a largely preponderating portion of the entire community; it is the class the most patient, and the one perhaps the most deeply attached to the ancient institutions of the country; but it is also the one with which the prosperity of every other class is inseparably interwoven, and which cannot be permanently, and, as some have argued, irremediably, depressed without results involving in imminent danger the very foundations of the state.

The Committee therefore conclude with expressing their confident hope, that besides adopting such present remedies as may appear just or expedient, the House will keep steadily and anxiously in their view the consideration of this the greatest question which can occupy their attention; in order, as circumstances may arise, to afford to the agriculturists of this kingdom that protection or relief which a just consideration of their situation in all its different bearings still continues imperatively to suggest.

In the American papers last received we find a very general anticipation of diminished wheat crops throughout the union. This applies to the southern as well as to the northern states. One of the New York journals

says—"The reports from all parts of Maryland, with regard to the grain crops, are discouraging. They all speak of great damage to the wheats by the Hessian fly, and many represent the destruction as total. The accounts from the western part of Virginia are of the same tenour. Letters from Washington county, Maryland, the best district for wheat in the state, represent the crop as seriously injured. In Lancaster county, Pennsylvania, the crop is not expected to be equal to one-fourth of an average crop; so also in the adjoining counties of Pennsylvania. The wheat crops in the state of Delaware are represented to be equally unpromising." The *Virginia Free Press* says—"It is painful to look at the blighted wheat fields of this region. The prospect is absolutely appalling. During the last three weeks vegetation has had the appearance of actually receding, and the ravages of the fly have been so fatal, that in many places the naked earth is presented, shorn of the rich verdure which for a while covered its bosom. The late rains have refreshed and invigorated other crops, but the wheat is beyond redemption."

#### EXTRACTS FROM LAWSON'S USEFUL WORK, THE AGRICULTURIST'S MANUAL.

**TREE OR COW-CABBAGE.**—Habit of growth, strong and upright, with numerous branches, and rather small and thin, smooth, vivid green-coloured leaves, stalks and branches very hard or woody, except towards the point, roots large and spreading, average height about five feet; but in very deep rich soil, the plants will often attain double that height before beginning to shoot or run to seed. In Jersey, and some of the northern departments of France, where this variety is chiefly cultivated, the longest of the stalks are used for supporting kidney beans, peas, &c., and also as cross-spars for the purpose of supporting the thatch or roof of the smaller class of farm buildings, cottages, &c., and when kept dry, are said to last upwards of half a century. (For farther information, see Loudon's Gardener's Magazine, and Encyclopedia of Agriculture.) This variety is also known by the following names:—Chou Cavalier, Chou a Vaches, Branching Cabbage, JERSEY KALE, &c. The produce of seeds of this last variety, however, which were procured from France, seems to be slightly different from the true Cow-Cabbage, and to occupy an intermediate space between it and the thousand-headed cabbage. Another variety received from the same quarter (and said to be only of recent introduction), under the name of Chou Laponic, Lapland Cabbage, seems to differ very slightly from the Cow Cabbage, and may be considered as only a very slightly improved variety.

In Museum, specimen of a stalk of Cow Cabbage 11½ feet in height, by the Very Reverend Principal Baird.

**CULTIVATION OF THE CABBAGE.**—Much has been said and written recommendatory of the cabbage tribe being more extensively subjected to field culture in this country, for feeding cattle, sheep, swine, and even poultry; but, judging from any trials which have been made, as well as from the natural habits of the whole tribe, their culture seems only likely to be attended with any chance of decided advantage on the most superior class of soils, particularly on such as are of rather strong texture, and where an abundant supply of manure can be had; and even in many such cases it is questionable how far they ought to be preferred to turnips, over which, however, they possess the advantage, as has been already hinted at, of improving, rather than deteriorating, the quality

of the milk of cows fed upon them, and also of growing freely on lands which are too stiff in texture for the growth of any sort of turnips.
